9 CHECK STEERING ANGLE SENSOR. 1) Turn the ignition switch to OFF. 2) Connect all the connectors. 3) Erase the memory. 4) Perform the inspection mode. 5) Read the DTC.	Is the same DTC displayed?	Replace the VDCCM&H/U. <Ref. to VDC-7, VDC Control Module and Hydraulic Control Unit (VDCCM/U).>	Go to step 10 .
10 CHECK OTHER DTC DETECTION.	Is any other DTC displayed?	Perform the diagnosis according to DTC.	Temporary poor contact occurs.
11 CHECK OTHER DTC DETECTION.	Is any other DTC displayed?	Perform the diagnosis according to DTC.	Original steering angle sensor malfunction

AV:DTC C0071 STEERING ANGLE SENSOR POWER SUPPLY MALFUNCTION

DTC DETECTING CONDITION:

Defective steering angle sensor

TROUBLE SYMPTOM:

- ABS does not operate.
- VDC does not operate.

NOTE:

- Warning light does not illuminate though problem is detected.
- The ABS and VDC operate normally if voltage returns.

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

VDC00247

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

VEHICLE DYNAMICS CONTROL (VDC) (DIAGNOSTICS)

Step	Check	Yes	No
1 CHECK POWER SUPPLY FOR STEERING ANGLE SENSOR. 1) Turn the ignition switch to OFF. 2) Disconnect the connector from steering angle sensor. 3) Turn the ignition switch to ON. 4) Measure the voltage between steering angle sensor and chassis ground. <i>Connector & terminal</i> <i>(B231) No. 4 (+) — Chassis ground (-):</i>	Is the voltage 10 — 15 V?	Go to step 4.	Go to step 2.
2 CHECK OUTPUT VOLTAGE OF VDCCM&H/U. Measure the voltage between VDCCM&H/U and chassis ground. <i>Connector & terminal</i> <i>(B310) No. 30 (+) — Chassis ground (-):</i>	Is the voltage 10 — 15 V?	Repair the harness between steering angle sensor and VDCCM&H/U.	Go to step 3.
3 CHECK POOR CONTACT IN CONNECTORS.	Is there poor contact in connector?	Correct or replace the connector.	Go to step 7.
4 CHECK GROUND CIRCUIT FOR STEERING ANGLE SENSOR. Measure the resistance between steering angle sensor and chassis ground. <i>Connector & terminal</i> <i>(B231) No. 3 — Chassis ground:</i>	Is the resistance less than 0.5 Ω?	Go to step 5.	Repair ground circuit in the steering angle sensor.
5 CHECK STEERING ANGLE SENSOR. 1) Turn the ignition switch to OFF. 2) Connect all the connectors. 3) Erase the memory. 4) Perform the inspection mode. 5) Read the DTC.	Is the same DTC displayed?	Go to step 6.	Go to step 8.
6 CHECK VDCCM&H/U. 1) Turn the ignition switch to OFF. 2) Replace the steering angle sensor. 3) Erase the memory. 4) Perform the inspection mode. 5) Read the DTC.	Is the same DTC displayed?	Replace the VDCCM&H/U. <Ref. to VDC-7, VDC Control Module and Hydraulic Control Unit (VDCCM/U).>	Go to step 9.
7 CHECK STEERING ANGLE SENSOR. 1) Turn the ignition switch to OFF. 2) Connect all the connectors. 3) Erase the memory. 4) Perform the inspection mode. 5) Read the DTC.	Is the same DTC displayed?	Replace the VDCCM&H/U. <Ref. to VDC-7, VDC Control Module and Hydraulic Control Unit (VDCCM/U).>	Go to step 8.
8 CHECK OTHER DTC DETECTION.	Is any other DTC displayed?	Perform the diagnosis according to DTC.	Temporary poor contact occurs.
9 CHECK OTHER DTC DETECTION.	Is any other DTC displayed?	Perform the diagnosis according to DTC.	Original steering angle sensor malfunction

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

VEHICLE DYNAMICS CONTROL (VDC) (DIAGNOSTICS)

AW:DTC C0072 YAW RATE SENSOR OUTPUT

DTC DETECTING CONDITION:

Defective yaw rate sensor

TROUBLE SYMPTOM:

VDC does not operate.

WIRING DIAGRAM:

VDC00222

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

VEHICLE DYNAMICS CONTROL (VDC) (DIAGNOSTICS)

Step	Check	Yes	No
1 CHECK DRIVING PLACE. Check if the vehicle ran the road with banks or sandy surface (which does not mean a dirt road).	Did the vehicle run the road with banks or sandy surface (which does not mean a dirt road)?	VDCCM&H/U may record DTC when the vehicle ran the road with banks or sandy surface (which does not mean a dirt road).	Go to step 2.
2 CHECK YAW RATE & LATERAL G SENSOR INSTALLATION.	Is the yaw rate & lateral G sensor installation bolt tightened to 7.5 N·m (0.76 kgf-m, 5.5 ft-lb)?	Go to step 3.	Tighten the yaw rate & lateral G sensor installation bolt.
3 CHECK OUTPUT OF YAW RATE & LATERAL G SENSOR WITH SUBARU SELECT MONITOR. 1) Drive the vehicle on a flat road. 2) Park the vehicle straight. 3) Select {Current Data Display & Save} in Subaru Select Monitor. 4) Read the yaw rate output displayed on display.	Is the reading indicated on monitor display -4 — 4 deg/s?	Go to step 4.	Replace the yaw rate & lateral G sensor.
4 CHECK OUTPUT OF STEERING ANGLE SENSOR WITH SUBARU SELECT MONITOR. 1) Drive the vehicle on a flat road. 2) Park the vehicle straight. 3) Select {Current Data Display & Save} in Subaru Select Monitor. 4) Read the steering angle sensor output displayed on display.	Is the reading indicated on monitor display -5 — 5°?	Go to step 5.	Perform the centering adjustment of steering wheel.
5 CHECK YAW RATE & LATERAL G SENSOR. 1) Turn the ignition switch to OFF. 2) Connect all the connectors. 3) Erase the memory. 4) Perform the inspection mode. 5) Read the DTC.	Is the same DTC displayed?	Go to step 6.	Go to step 7.
6 CHECK VDCCM&H/U. 1) Turn the ignition switch to OFF. 2) Replace the yaw rate & lateral G sensor. 3) Erase the memory. 4) Perform the inspection mode. 5) Read the DTC.	Is the same DTC displayed?	Replace the VDCCM&H/U. <Ref. to VDC-7, VDC Control Module and Hydraulic Control Unit (VDCCM/U).>	Go to step 8.
7 CHECK OTHER DTC DETECTION.	Is any other DTC displayed?	Perform the diagnosis according to DTC.	Temporary poor contact occurs.
8 CHECK OTHER DTC DETECTION.	Is any other DTC displayed?	Perform the diagnosis according to DTC.	Malfunction is found in original yaw rate & lateral G sensor.

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

VEHICLE DYNAMICS CONTROL (VDC) (DIAGNOSTICS)

AX:DTC C0072 YAW RATE SENSOR POWER/OUTPUT

DTC DETECTING CONDITION:

Defective yaw rate sensor

TROUBLE SYMPTOM:

VDC does not operate.

WIRING DIAGRAM:

VDC00222

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

VEHICLE DYNAMICS CONTROL (VDC) (DIAGNOSTICS)

Step	Check	Yes	No
1 CHECK YAW RATE & LATERAL G SENSOR POWER SUPPLY. 1) Turn the ignition switch to OFF. 2) Disconnect the connector from the yaw rate & lateral G sensor. 3) Turn the ignition switch to ON. 4) Measure the voltage between yaw rate & lateral G sensor and chassis ground. <i>Connector & terminal</i> <i>(B230) No. 3 (+) — Chassis ground (-):</i>	Is the voltage 10 — 15 V?	Go to step 4.	Go to step 2.
2 CHECK OUTPUT VOLTAGE OF VDCCM&H/U. Measure the voltage between VDCCM&H/U and chassis ground. <i>Connector & terminal</i> <i>(B310) No. 30 (+) — Chassis ground (-):</i>	Is the voltage 10 — 15 V?	Repair the harness between yaw rate & lateral G sensor and VDCCM&H/U.	Go to step 3.
3 CHECK POOR CONTACT IN CONNECTORS.	Is there poor contact in connector?	Correct or replace the connector.	Go to step 10.
4 CHECK GROUND CIRCUIT OF YAW RATE & LATERAL G SENSOR. Measure the resistance between yaw rate & lateral G sensor and chassis ground. <i>Connector & terminal</i> <i>(B230) No. 6 — Chassis ground:</i>	Is the resistance less than 0.5 Ω ?	Go to step 7.	Go to step 5.
5 CHECK GROUND CIRCUIT FOR VDCCM&H/U. Measure the resistance between VDCCM&H/U and chassis ground. <i>Connector & terminal</i> <i>(B310) No. 16 — Chassis ground:</i>	Is the resistance less than 0.5 Ω ?	Repair the harness between yaw rate & lateral G sensor and VDCCM&H/U.	Go to step 6.
6 CHECK POOR CONTACT IN CONNECTORS.	Is there poor contact in connector?	Correct or replace the connector.	Go to step 10.
7 CHECK YAW RATE & LATERAL G SENSOR HARNESS. 1) Disconnect the connector from VDCCM&H/U. 2) Measure the resistance between VDCCM&H/U and yaw rate & lateral G sensor. <i>Connector & terminal</i> <i>(B310) No. 28 — (B230) No. 4:</i>	Is the resistance less than 0.5 Ω ?	Go to step 8.	Repair the harness between yaw rate & lateral G sensor and VDCCM&H/U.
8 CHECK GROUND SHORT OF HARNESS. Measure the resistance between VDCCM&H/U connector and chassis ground. <i>Connector & terminal</i> <i>(B310) No. 28 — Chassis ground:</i>	Is the resistance more than 1 M Ω ?	Go to step 9.	Repair the harness between yaw rate & lateral G sensor and VDCCM&H/U.
9 CHECK YAW RATE & LATERAL G SENSOR. 1) Connect all the connectors. 2) Turn the ignition switch to ON. 3) Check the signal pattern of oscilloscope between VDCCM&H/U connector terminals. <Ref. to VDC(diag)-15, WAVEFORM, MEASUREMENT, Control Module I/O Signal.> <i>Connector & terminal</i> <i>(B310) No. 2 — No. 16:</i> <i>(B310) No. 28 — No. 16:</i>	Is the oscilloscope waveform pattern as shown in the figure?	Go to step 10.	Replace the yaw rate & lateral G sensor.

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

VEHICLE DYNAMICS CONTROL (VDC) (DIAGNOSTICS)

Step	Check	Yes	No
10 CHECK YAW RATE & LATERAL G SENSOR. 1) Turn the ignition switch to OFF. 2) Connect all the connectors. 3) Erase the memory. 4) Perform the inspection mode. 5) Read the DTC.	Is the same DTC displayed?	Replace the VDCCM&H/U. <Ref. to VDC-7, VDC Control Module and Hydraulic Control Unit (VDCCM/U).>	Go to step 11.
11 CHECK OTHER DTC DETECTION.	Is any other DTC displayed?	Perform the diagnosis according to DTC.	Temporary poor contact occurs.

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

VEHICLE DYNAMICS CONTROL (VDC) (DIAGNOSTICS)

AZ:DTC C0072 EXCESSIVE VARIATION AMOUNT OF YAW RATE SENSOR OUTPUT

DTC DETECTING CONDITION:

Defective yaw rate sensor

TROUBLE SYMPTOM:

VDC does not operate.

WIRING DIAGRAM:

VDC00222

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

VEHICLE DYNAMICS CONTROL (VDC) (DIAGNOSTICS)

Step	Check	Yes	No
1 CHECK DRIVING PLACE. Check if the vehicle ran the road with banks or sandy surface (which does not mean a dirt road).	Did the vehicle run the road with banks or sandy surface (which does not mean a dirt road)?	VDCCM&H/U may record DTC when the vehicle ran the road with banks or sandy surface (which does not mean a dirt road).	Go to step 2.
2 CHECK YAW RATE & LATERAL G SENSOR INSTALLATION.	Is the yaw rate & lateral G sensor installation bolt tightened to 7.5 N·m (0.76 kgf·m, 5.5 ft·lb)?	Go to step 3.	Tighten the yaw rate & lateral G sensor installation bolt.
3 CHECK YAW RATE & LATERAL G SENSOR POWER SUPPLY. 1) Turn the ignition switch to OFF. 2) Disconnect the connector from yaw rate & lateral G sensor. 3) Turn the ignition switch to ON. 4) Measure the voltage between yaw rate & lateral G sensor and chassis ground. <i>Connector & terminal</i> <i>(B230) No. 3 (+) — Chassis ground (-):</i>	Is the voltage 10 — 15 V?	Go to step 5.	Go to step 4.
4 CHECK OUTPUT VOLTAGE OF VDCCM&H/U. Measure the voltage between VDCCM&H/U and chassis ground. <i>Connector & terminal</i> <i>(B310) No. 30 (+) — Chassis ground (-):</i>	Is the voltage 10 — 15 V?	Repair the harness between yaw rate & lateral G sensor and VDCCM&H/U.	Go to step 7.
5 CHECK GROUND CIRCUIT OF YAW RATE & LATERAL G SENSOR. Measure the resistance between yaw rate & lateral G sensor and chassis ground. <i>Connector & terminal</i> <i>(B230) No. 6 — Chassis ground:</i>	Is the resistance less than 0.5 Ω ?	Go to step 8.	Go to step 6.
6 CHECK GROUND CIRCUIT FOR VDCCM&H/U. Measure the resistance between VDCCM&H/U and chassis ground. <i>Connector & terminal</i> <i>(B310) No. 16 — Chassis ground:</i>	Is the resistance less than 0.5 Ω ?	Repair the harness between yaw rate & lateral G sensor and VDCCM&H/U.	Go to step 7.
7 CHECK POOR CONTACT IN CONNECTORS.	Is there poor contact in connector?	Correct or replace the connector.	Go to step 14.
8 CHECK HARNESS OF YAW RATE & LATERAL G SENSOR. 1) Disconnect the connector from VDCCM&H/U. 2) Measure the resistance between VDCCM&H/U and yaw rate & lateral G sensor. <i>Connector & terminal</i> <i>(B310) No. 1 — (B230) No. 1:</i> <i>(B310) No. 2 — (B230) No. 2:</i> <i>(B310) No. 28 — (B230) No. 4:</i>	Is the resistance less than 0.5 Ω ?	Go to step 9.	Repair the harness between yaw rate & lateral G sensor and VDCCM&H/U.
9 CHECK GROUND SHORT CIRCUIT OF HARNESS. Measure the resistance between VDCCM&H/U connector and chassis ground. <i>Connector & terminal</i> <i>(B310) No. 1 — Chassis ground:</i> <i>(B310) No. 2 — Chassis ground:</i> <i>(B310) No. 28 — Chassis ground:</i>	Is the resistance more than 1 M Ω ?	Go to step 10.	Repair the harness between yaw rate & lateral G sensor and VDCCM&H/U.

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

VEHICLE DYNAMICS CONTROL (VDC) (DIAGNOSTICS)

Step	Check	Yes	No
10 CHECK YAW RATE & LATERAL G SENSOR. 1) Turn the ignition switch to OFF. 2) Connect all the connectors. 3) Turn the ignition switch to ON. 4) Measure the voltage between VDCCM&H/U connector terminals. Connector & terminal (B310) No. 1 (+) — (B310) No. 16 (-):	Is the voltage 2.1 — 2.9 V?	Go to step 11.	Replace the yaw rate & lateral G sensor.
11 CHECK YAW RATE & LATERAL G SENSOR. 1) Turn the ignition switch to ON. 2) Check the signal pattern of oscilloscope between VDCCM&H/U connector terminals. <Ref. to VDC(diag)-15, WAVEFORM, MEASUREMENT, Control Module I/O Signal.> Connector & terminal (B310) No. 2 — No. 16: (B310) No. 28 — No. 16:	Is the oscilloscope waveform pattern as shown in the figure?	Go to step 12.	Replace the yaw rate & lateral G sensor.
12 CHECK YAW RATE & LATERAL G SENSOR. 1) Turn the ignition switch to OFF. 2) Connect all the connectors. 3) Erase the memory. 4) Perform the inspection mode. 5) Read the DTC.	Is the same DTC displayed?	Go to step 13.	Go to step 15.
13 CHECK VDCCM&H/U. 1) Turn the ignition switch to OFF. 2) Replace the yaw rate & lateral G sensor. 3) Erase the memory. 4) Perform the inspection mode. 5) Read the DTC.	Is the same DTC displayed?	Replace the VDCCM&H/U. <Ref. to VDC-7, VDC Control Module and Hydraulic Control Unit (VDCCM/U).>	Go to step 16.
14 CHECK YAW RATE & LATERAL G SENSOR. 1) Turn the ignition switch to OFF. 2) Connect all the connectors. 3) Erase the memory. 4) Perform the inspection mode. 5) Read the DTC.	Is the same DTC displayed?	Replace the VDCCM&H/U. <Ref. to VDC-7, VDC Control Module and Hydraulic Control Unit (VDCCM/U).>	Go to step 15.
15 CHECK OTHER DTC DETECTION.	Is any other DTC displayed?	Perform the diagnosis according to DTC.	Temporary poor contact occurs.
16 CHECK OTHER DTC DETECTION.	Is any other DTC displayed?	Perform the diagnosis according to DTC.	Malfunction is found in original yaw rate & lateral G sensor.

VEHICLE DYNAMICS CONTROL (VDC) (DIAGNOSTICS)

Step	Check	Yes	No
1	CHECK YAW RATE & LATERAL G SENSOR INSTALLATION.	Go to step 2.	Tighten the yaw rate & lateral G sensor installation bolt.
2	CHECK LATERAL G SENSOR OUTPUT. 1) Park the vehicle on a level surface. 2) Select {Current Data Display & Save} in Subaru Select Monitor. 3) Read the lateral G sensor output displayed on display.	Go to step 3.	Replace the yaw rate & lateral G sensor.
3	CHECK LATERAL G SENSOR OUTPUT. 1) Turn the ignition switch to OFF. 2) Remove the yaw rate & lateral G sensor from vehicle. 3) Turn the ignition switch to ON, and select {Current Data Display & Save} in Subaru Select Monitor. 4) Read the lateral G sensor output displayed on display.	Go to step 4.	Replace the yaw rate & lateral G sensor.
4	CHECK LATERAL G SENSOR. Read the lateral G sensor output displayed on screen.	Go to step 5.	Replace the yaw rate & lateral G sensor.
5	CHECK POOR CONTACT IN CONNECTORS. Turn the ignition switch to OFF.	Repair the connector.	Go to step 6.
6	CHECK VDCCM&H/U. 1) Connect all the connectors. 2) Erase the memory. 3) Perform the inspection mode. 4) Read the DTC.	Replace the VDCCM&H/U. <Ref. to VDC-7, VDC Control Module and Hydraulic Control Unit (VDCCM/U).>	Go to step 7.
7	CHECK OTHER DTC DETECTION.	Perform the diagnosis according to DTC.	Temporary poor contact occurs.

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

VEHICLE DYNAMICS CONTROL (VDC) (DIAGNOSTICS)

BE:DTC C0073 LATERAL G SENSOR POWER/OUTPUT

DTC DETECTING CONDITION:

Defective lateral G sensor

DTC DETECTING CONDITION:

VDC does not operate.

WIRING DIAGRAM:

VDC00222

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

VEHICLE DYNAMICS CONTROL (VDC) (DIAGNOSTICS)

Step	Check	Yes	No
1 CHECK LATERAL G SENSOR OUTPUT. 1) Park the vehicle on a level surface. 2) Select {Current Data Display & Save} in Subaru Select Monitor. 3) Read the lateral G sensor output displayed on display.	Is the indicated reading on the monitor display -1.5 — 1.5 m/s ² ?	Go to step 2.	Go to step 3.
2 CHECK POOR CONTACT IN CONNECTORS. Turn the ignition switch to OFF.	Is there poor contact in connector between VDCCM&H/U and yaw rate & lateral G sensor?	Repair the connector.	Go to step 10.
3 CHECK YAW RATE & LATERAL G SENSOR POWER SUPPLY. 1) Turn the ignition switch to OFF. 2) Disconnect the connector from yaw rate & lateral G sensor. 3) Turn the ignition switch to ON. 4) Measure the voltage between yaw rate & lateral G sensor and chassis ground. <i>Connector & terminal</i> <i>(B230) No. 3 (+) — Chassis ground (-):</i>	Is the voltage 10 — 15 V?	Go to step 6.	Go to step 4.
4 CHECK OUTPUT VOLTAGE OF VDCCM&H/U. Measure the voltage between VDCCM&H/U and chassis ground. <i>Connector & terminal</i> <i>(B310) No. 30 (+) — Chassis ground (-):</i>	Is the voltage 10 — 15 V?	Repair the harness between yaw rate & lateral G sensor and VDCCM&H/U.	Go to step 5.
5 CHECK POOR CONTACT IN CONNECTORS	Is there poor contact in connector?	Correct or replace the connector.	Go to step 10.
6 CHECK OPEN CIRCUIT IN LATERAL G SENSOR OUTPUT HARNESS. 1) Disconnect the connector from yaw rate & lateral G sensor. 2) Disconnect the connector from VDCCM&H/U. 3) Measure the resistance between VDCCM&H/U and yaw rate & lateral G sensor. <i>Connector & terminal</i> <i>(B310) No. 3 — (B230) No. 5:</i>	Is the resistance less than 0.5 Ω?	Go to step 7.	Repair the harness connector between yaw rate & lateral G sensor and VDCCM&H/U.
7 CHECK GROUND SHORT CIRCUIT FOR YAW RATE & LATERAL G SENSOR HARNESS. Measure the resistance between VDCCM&H/U connector and chassis ground. <i>Connector & terminal</i> <i>(B310) No. 3 — Chassis ground:</i>	Is the resistance more than 1 MΩ?	Go to step 8.	Repair the harness connector between yaw rate & lateral G sensor and VDCCM&H/U.
8 CHECK LATERAL G SENSOR. 1) Turn the ignition switch to OFF. 2) Remove the yaw rate & lateral G sensor from vehicle. 3) Connect the connector to the yaw rate & lateral G sensor. 4) Connect the connector to VDCCM&H/U. 5) Turn the ignition switch to ON. 6) Measure the voltage between yaw rate & lateral G sensor connector terminals. <i>Connector & terminal</i> <i>(B230) No. 5 (+) — (B230) No. 6 (-):</i>	Is the voltage 2.35 — 2.65 V when yaw rate & lateral G sensor is on level?	Go to step 9.	Replace the yaw rate & lateral G sensor.

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

VEHICLE DYNAMICS CONTROL (VDC) (DIAGNOSTICS)

Step	Check	Yes	No
9 CHECK POOR CONTACT IN CONNECTORS.	Is there poor contact in connector between VDCCM&H/U and yaw rate & lateral G sensor?	Repair the connector.	Go to step 10 .
10 CHECK VDCCM&H/U. 1) Connect all the connectors. 2) Erase the memory. 3) Perform the inspection mode. 4) Read the DTC.	Is the same DTC displayed?	Replace the VDCCM&H/U. <Ref. to VDC-7, VDC Control Module and Hydraulic Control Unit (VDCCM/U).>	Go to step 11 .
11 CHECK OTHER DTC DETECTION.	Is any other DTC displayed?	Perform the diagnosis according to DTC.	Temporary poor contact occurs.

BF:DTC C0074 PRESSURE SENSOR TEST MALFUNCTION

DTC DETECTING CONDITION:

Defective pressure sensor

TROUBLE SYMPTOM:

- ABS does not operate.
- VDC does not operate.

WIRING DIAGRAM:

Step	Check	Yes	No
<p>1</p> <p>CHECK PRESSURE SENSOR POWER SUPPLY.</p> <p>1) Turn the ignition switch to OFF.</p> <p>2) Disconnect the connector from pressure sensor.</p> <p>3) Turn the ignition switch to ON.</p> <p>4) Measure the voltage between pressure sensor connector and chassis ground.</p> <p>Connector & terminal (B348) No. 3 (+) — Chassis ground (-):</p>	<p>Is the voltage 4.75 — 5.25 V?</p>	<p>Go to step 4.</p>	<p>Go to step 2.</p>

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

VEHICLE DYNAMICS CONTROL (VDC) (DIAGNOSTICS)

Step	Check	Yes	No
2 CHECK OUTPUT VOLTAGE OF VDCCM&H/U. Measure the voltage between VDCCM&H/U and chassis ground. <i>Connector & terminal</i> <i>(B310) No. 27 (+) — Chassis ground (-):</i>	Is the voltage 4.75 — 5.25 V?	Repair the harness between pressure sensor and VDCCM&H/U.	Go to step 3.
3 CHECK POOR CONTACT IN CONNECTORS.	Is there poor contact in connector?	Correct or replace the connector.	Go to step 9.
4 CHECK GROUND CIRCUIT OF PRESSURE SENSOR. Measure the resistance between pressure sensor and chassis ground. <i>Connector & terminal</i> <i>(B348) No. 1 — Chassis ground:</i>	Is the resistance less than 0.5 Ω ?	Go to step 7.	Go to step 5.
5 CHECK GROUND CIRCUIT OF VDCCM&H/U. Measure the resistance between VDCCM&H/U and chassis ground. <i>Connector & terminal</i> <i>(B310) No. 12 — Chassis ground:</i>	Is the resistance less than 0.5 Ω ?	Repair the harness between pressure sensor and VDCCM&H/U.	Go to step 6.
6 CHECK POOR CONTACT IN CONNECTORS.	Is there poor contact in connector?	Correct or replace the connector.	Go to step 9.
7 CHECK PRESSURE SENSOR HARNESS. 1) Turn the ignition switch to OFF. 2) Disconnect the connector from VDCCM&H/U. 3) Measure the resistance between VDCCM&H/U and pressure sensor. <i>Connector & terminal</i> <i>(B310) No. 11 — (B348) No. 2:</i>	Is the resistance less than 0.5 Ω ?	Go to step 8.	Repair the harness between pressure sensor and VDCCM&H/U.
8 CHECK GROUND SHORT OF HARNESS. Measure the resistance between VDCCM&H/U connector and chassis ground. <i>Connector & terminal</i> <i>(B310) No. 11 — Chassis ground:</i>	Is the resistance more than 1 M Ω ?	Go to step 9.	Repair the harness between pressure sensor and VDCCM&H/U.
9 CHECK VDCCM&H/U. 1) Connect all the connectors. 2) Erase the memory. 3) Perform the inspection mode. 4) Read the DTC.	Is DTC displayed?	Replace the VDCCM&H/U. <Ref. to VDC-7, VDC Control Module and Hydraulic Control Unit (VDCCM/U).>	Go to step 10.
10 CHECK OTHER DTC DETECTION.	Is any other DTC displayed?	Perform the diagnosis according to DTC.	Temporary poor contact occurs.

BG:DTC C0074 EXCESSIVE PRESSURE SENSOR OUTPUT OFFSET

DTC DETECTING CONDITION:

Defective pressure sensor

TROUBLE SYMPTOM:

- ABS does not operate.
- VDC does not operate.

WIRING DIAGRAM:

Step	Check	Yes	No
1	CHECK STOP LIGHT SWITCH CIRCUIT. Check stop light switch open circuit.	Is the stop light switch circuit OK?	Go to step 2. Repair the stop light switch circuit.
2	CHECK VDCCM&H/U. 1) Connect all the connectors. 2) Erase the memory. 3) Perform the inspection mode. 4) Read the DTC.	Is the same DTC displayed?	Replace the VDCCM&H/U. <Ref. to VDC-7, VDC Control Module and Hydraulic Control Unit (VDCCM/U).> Go to step 3.

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

VEHICLE DYNAMICS CONTROL (VDC) (DIAGNOSTICS)

Step	Check	Yes	No
3 CHECK OTHER DTC DETECTION.	Is any other DTC displayed?	Perform the diagnosis according to DTC. <Ref. to VDC(diag)-34, List of Diagnostic Trouble Code (DTC).>	Temporary poor contact occurs.

BH:DTC C0074 PRESSURE SENSOR POWER/OUTPUT

DTC DETECTING CONDITION:

Defective pressure sensor

TROUBLE SYMPTOM:

- ABS does not operate.
- VDC does not operate.

NOTE:

For the diagnostic procedure, refer to DTC C0074 "PRESSURE SENSOR TEST MALFUNCTION". <Ref. to VDC(diag)-111, DTC C0074 PRESSURE SENSOR TEST MALFUNCTION, Diagnostic Procedure with Diagnostic Trouble Code (DTC).>

BI: DTC C0074 PRESSURE SENSOR OUTPUT

DTC DETECTING CONDITION:

Defective pressure sensor

TROUBLE SYMPTOM:

- ABS does not operate.
- VDC does not operate.

WIRING DIAGRAM:

	Step	Check	Yes	No
1	CHECK STOP LIGHT SWITCH CIRCUIT. Check stop light switch open circuit.	Is the stop light switch circuit OK?	Go to step 2.	If there is malfunction in the stop light switch circuit, DTC may be recorded in the memory.

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

VEHICLE DYNAMICS CONTROL (VDC) (DIAGNOSTICS)

Step	Check	Yes	No
2 CHECK PRESSURE SENSOR POWER SUPPLY. 1) Turn the ignition switch to OFF. 2) Disconnect the connector from pressure sensor. 3) Turn the ignition switch to ON. 4) Measure the voltage between pressure sensor connector and chassis ground. <i>Connector & terminal</i> <i>(B348) No. 3 (+) — Chassis ground (-):</i>	Is the voltage 4.75 — 5.25 V?	Go to step 5.	Go to step 3.
3 CHECK OUTPUT VOLTAGE OF VDCCM&H/U. Measure the voltage between VDCCM&H/U and chassis ground. <i>Connector & terminal</i> <i>(B310) No. 27 (+) — Chassis ground (-):</i>	Is the voltage 4.75 — 5.25 V?	Repair the harness between pressure sensor and VDCCM&H/U.	Go to step 4.
4 CHECK POOR CONTACT IN CONNECTORS.	Is there poor contact in connector?	Correct or replace the connector.	Go to step 10.
5 CHECK GROUND CIRCUIT OF PRESSURE SENSOR. Measure the resistance between pressure sensor and chassis ground. <i>Connector & terminal</i> <i>(B348) No. 1 — Chassis ground:</i>	Is the resistance less than 0.5 Ω ?	Go to step 8.	Go to step 6.
6 CHECK GROUND CIRCUIT OF VDCCM&H/U. Measure the resistance between VDCCM&H/U and chassis ground. <i>Connector & terminal</i> <i>(B310) No. 12 — Chassis ground:</i>	Is the resistance less than 0.5 Ω ?	Repair the harness between pressure sensor and VDCCM&H/U.	Go to step 7.
7 CHECK POOR CONTACT IN CONNECTORS.	Is there poor contact in connector?	Correct or replace the connector.	Go to step 10.
8 CHECK PRESSURE SENSOR HARNESS. 1) Turn the ignition switch to OFF. 2) Disconnect the connector from VDCCM&H/U. 3) Measure the resistance between VDCCM&H/U and pressure sensor. <i>Connector & terminal</i> <i>(B310) No. 11 — (B348) No. 2:</i>	Is the resistance less than 0.5 Ω ?	Go to step 9.	Repair the harness between pressure sensor and VDCCM&H/U.
9 CHECK GROUND SHORT OF HARNESS. Measure the resistance between VDCCM&H/U connector and chassis ground. <i>Connector & terminal</i> <i>(B310) No. 11 — Chassis ground:</i>	Is the resistance more than 1 M Ω ?	Go to step 10.	Repair the harness between pressure sensor and VDCCM&H/U.
10 CHECK VDCCM&H/U. 1) Connect all the connectors. 2) Erase the memory. 3) Perform the inspection mode. 4) Read the DTC.	Is DTC displayed?	Replace the VDCCM&H/U. <Ref. to VDC-7, VDC Control Module and Hydraulic Control Unit (VDCCM/U).>	Go to step 11.
11 CHECK OTHER DTC DETECTION.	Is any other DTC displayed?	Perform the diagnosis according to DTC.	Temporary poor contact occurs.

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

VEHICLE DYNAMICS CONTROL (VDC) (DIAGNOSTICS)

Step	Check	Yes	No
1 CHECK POOR CONTACT IN CONNECTORS. Check if there is poor contact in VDCCM&H/U power supply circuit.	Is there poor contact?	Repair the connector.	Go to step 2.
2 CHECK VDCCM&H/U POWER SUPPLY CIRCUIT. 1) Turn the ignition switch to OFF. 2) Disconnect the VDCCM&H/U connector. 3) Turn the ignition switch to ON. 4) Measure the voltage between VDCCM&H/U connector terminals. <i>Connector & terminal</i> <i>(B310) No. 14 (+) — (B310) No. 6 (-):</i>	Is the voltage 10 — 15 V?	Go to step 3.	Check the power supply circuit in VDCCM&H/U.
3 CHECK VDCCM&H/U. 1) Connect all the connectors. 2) Erase the memory. 3) Perform the inspection mode. 4) Read the DTC.	Is the same DTC displayed?	Replace the VDCCM&H/U. <Ref. to VDC-7, VDC Control Module and Hydraulic Control Unit (VDCCM/U).>	Go to step 4.
4 CHECK OTHER DTC DETECTION.	Is any other DTC displayed?	Perform the diagnosis according to DTC.	It results from a temporary noise interference.

BK:DTC C0081 SYSTEM MALFUNCTION

DTC DETECTING CONDITION:

VDC long time sequential control

TROUBLE SYMPTOM:

- ABS does not operate.
- VDC does not operate.

Step	Check	Yes	No
1 CHECK POOR CONTACT IN CONNECTOR.	Is there poor contact in the VDCCM&H/U and yaw rate & lateral G sensor connector?	Repair the connector.	Go to step 2.
2 CHECK VDCCM&H/U. 1) Replace the yaw rate & lateral G sensor. 2) Connect all the connectors. 3) Erase the memory. 4) Perform the inspection mode. 5) Read the DTC.	Is the same DTC displayed?	Replace the VDCCM&H/U.	Malfunction is found in original yaw rate & lateral G sensor.

General Diagnostic Table

VEHICLE DYNAMICS CONTROL (VDC) (DIAGNOSTICS)

13. General Diagnostic Table

A: INSPECTION

Symptom		Main probable cause	Other probable cause
Poor brake performance	Long braking/stopping distance	<ul style="list-style-type: none"> • VDCCM&H/U • Brake pad • Aeration to brake line • Tire specifications, tire wear and air pressures • Incorrect wiring or piping connections 	<ul style="list-style-type: none"> • Defective ABS wheel speed sensor or sensor gap • Defective steering angle sensor or improper neutral position • Defective yaw rate & lateral G sensor or improper installation • Master cylinder • Brake caliper • Disc rotor • Brake pipe • Brake booster
	Wheel lock	<ul style="list-style-type: none"> • VDCCM&H/U • Defective ABS wheel speed sensor or sensor gap • Incorrect wiring or piping connections 	<ul style="list-style-type: none"> • Defective steering angle sensor or improper neutral position • Defective yaw rate & lateral G sensor or improper installation • Brake caliper • Brake pipe

C: CAUTION

- Wear work clothing, including a cap, protective goggles, and protective shoes during operation.
- Before removal, installation or disassembly, be sure to clarify the failure. Avoid unnecessary removal, installation, disassembly and replacement.
- Use SUBARU genuine grease etc. or equivalent. Do not mix grease, etc. with that of another grade or from other manufacturers.
- Before securing a part on a vice, place cushioning material such as wood blocks, aluminum plate, or shop cloth between the part and the vice.

- Be sure to tighten fasteners including bolts and nuts to the specified torque.
- Place shop jacks or rigid racks at the specified points.

General Description

BRAKE

D: PREPARATION TOOL

1. GENERAL TOOL

TOOL NAME	REMARKS
Snap ring pliers	Used for removing and installing snap ring.

2. Front Brake Pad

A: REMOVAL

1. 15-INCH TYPE

- 1) Lift-up the vehicle and remove front wheels.
- 2) Remove the caliper bolt.

- 3) Raise the caliper body and support it.

NOTE:

Do not disconnect the brake hose from caliper body.

- 4) Remove the pad.

NOTE:

If the brake pad is difficult to remove, proceed as follows:

- (1) Remove the caliper body from support.
- (2) Remove the support.
- (3) Place the support in a vise between wooden blocks.

- (1) Support
- (2) Wooden block

- (4) Attach a rod of less than 12 mm (0.47 in) diameter to the shaded area of the brake pad, and strike the rod with a hammer to drive brake pad out of place.

2. 16-INCH TYPE

Refer to 15-inch type. <Ref. to BR-13, 15-INCH TYPE, REMOVAL, Front Brake Pad.>

3. 17-INCH TYPE

Refer to 15-inch type. <Ref. to BR-13, 15-INCH TYPE, REMOVAL, Front Brake Pad.>

B: INSTALLATION

1. 15-INCH TYPE

- 1) Apply a thin coat of Molykote M7439 to pad clip.

- 2) Apply a thin coat of Molykote AS880N (Part No. K0779YA010) to the frictional portion between pad and pad inner shim.

Front Brake Pad

BRAKE

3) Apply a thin coat of Molykote AS880N (Part No. K0779YA010) to the three frictional portions between inner shim and outer shim of outer pads.

- 4) Install the pad on support.
- 5) Install the caliper body on support.

Tightening torque:

27 N·m (2.8 kgf·m, 19.9 ft·lb)

2. 16-INCH TYPE

Refer to 15-inch type. <Ref. to BR-13, 15-INCH TYPE, INSTALLATION, Front Brake Pad.>

3. 17-INCH TYPE

- 1) Apply a thin coat of Molykote M7439 to pad clip.

- 2) Apply a thin coat of Molykote AS880N (Part No. K0779YA010) to the frictional portion between pad and pad inner shim.

3) Apply a thin coat of Molykote AS880N (Part No. K0779YA010) to the three frictional portions between inner shim and outer shim of outer pads.

- 4) Install the pad on support.

NOTE:

Install the pad indicator in proper direction.

- (1) LH – IN
- (2) LH – OUT
- (3) RH – IN
- (4) RH – OUT
- (5) Pad indicator
- (6) Pad return spring

CAUTION:

- Be sure to install so that the direction of pad return spring faces to the input side of brake rotor rotation direction as shown in the figure.
- Correctly install the pad return spring to supporting surface of pad clip as shown in the figure.

- When the pad return spring is deformed or damaged, replace the brake pad with new one.

- (1) Pad return spring
- (2) Supporting surface of pad clip
- (3) Brake rotor rotation direction

5) Install the caliper body on support.

Tightening torque:
 27 N·m (2.8 kgf·m, 19.9 ft·lb)

C: INSPECTION

1. 15-INCH TYPE

Check the pad thickness A.

Pad thickness mm (in)	Standard value	11 (0.43)
	Wear limit	1.5 (0.059)

NOTE:

- Always replace the pads for both right and left wheels as a set.
- Also replace the pad clips if they are twisted or worn.
- Replace the pad if there is oil or grease on it.

2. 16-INCH TYPE

Refer to 15-inch type. <Ref. to BR-15, 15-INCH TYPE, INSPECTION, Front Brake Pad.>

3. 17-INCH TYPE

Check the pad thickness A.

Pad thickness mm (in)	Standard value	11 (0.43)
	Wear limit	1.5 (0.059)

NOTE:

- Always replace the pads for both right and left wheels as a set.
- Replace the pad if there is oil or grease on it.

3. Front Disc Rotor

A: REMOVAL

1. 15-INCH TYPE

- 1) Lift-up the vehicle, and remove the front wheels.
- 2) Remove the caliper body and the support from housing, and suspend it from strut using a wire.

- 3) Remove the disc rotor.

NOTE:

If the disc rotor seizes up within hub, drive the disc rotor out by pushing with an 8 mm bolt in holes B on the rotor.

- 4) Clean mud and foreign particles from the caliper body assembly and the support.

2. 16-INCH TYPE

Refer to 15-inch type. <Ref. to BR-16, 15-INCH TYPE, REMOVAL, Front Disc Rotor.>

3. 17-INCH TYPE

Refer to 15-inch type. <Ref. to BR-16, 15-INCH TYPE, REMOVAL, Front Disc Rotor.>

B: INSTALLATION

- 1) Install the disc rotor.
- 2) Install the caliper body and the support to housing.

Tightening torque:

80 N·m (8.2 kgf·m, 59 ft·lb)

- 3) Install the front wheels.

C: INSPECTION

- 1) Check front wheel bearing play and axial hub runout before disc rotor runout limit inspection. <Ref. to DS-16, INSPECTION, Front Axle.>
- 2) Secure the disc rotor by tightening five wheel nuts.
- 3) Set a dial gauge 10 mm (0.39 in) inward of the rotor outer perimeter. Turn the disc rotor to check runout. If the disc rotor runout exceeds the service limit, resurface the disc rotor. After resurfacing, check disc rotor thickness as in step 4.

Disc rotor runout limit:

0.05 mm (0.0020 in)

- 4) Set a micrometer 10 mm (0.39 in) inward of the rotor outer perimeter, and then measure the disc rotor thickness. If the thickness of disc rotor exceeds the service limit, replace with a new disc rotor.

		Standard value	Limit	Disc rotor outer diameter
Disc rotor thickness A mm (in)	15"	24 (0.94)	22 (0.87)	277 (10.91)
	16"	24 (0.94)	22 (0.87)	294 (11.57)
	17"	30 (1.18)	28 (1.10)	316 (12.44)

4. Front Disc Brake Assembly

A: REMOVAL

1. 15-INCH TYPE

CAUTION:

Do not allow brake fluid to come in contact with vehicle body; wash away with water and wipe off completely if spilled.

- 1) Lift-up the vehicle, and remove the front wheels.
- 2) Remove the union bolt, and disconnect the brake hose from caliper body assembly.

- 3) Remove the bolt securing lock pin to caliper body.

- 4) Raise the caliper body, and then move it toward vehicle center to separate it from support.
- 5) Remove the support from housing.

NOTE:

Remove the support only when replacing itself or rotor. It need not be removed when servicing the caliper body assembly.

- 6) Clean mud and foreign particles from the caliper body assembly and the support.

2. 16-INCH TYPE

Refer to 15-inch type. <Ref. to BR-17, 15-INCH TYPE, REMOVAL, Front Disc Brake Assembly.>

3. 17-INCH TYPE

Refer to 15-inch type. <Ref. to BR-17, 15-INCH TYPE, REMOVAL, Front Disc Brake Assembly.>

B: INSTALLATION

1. 15-INCH TYPE

- 1) Install the support on housing.

Tightening torque:

80 N·m (8.2 kgf-m, 59 ft-lb)

- 2) Apply a thin coat of Molykote M7439 to pad clip.

- 3) Apply a thin coat of Molykote AS880N (Part No. K0777YA010) to the frictional portion between pad and inner shim.

Front Disc Brake Assembly

BRAKE

4) Apply a thin coat of Molykote AS880N (Part No. K0777YA010) to the three frictional portions between inner shim and outer shim of outer pads.

5) Install the pad on support.
6) Install the caliper body on support.

Tightening torque:

27 N-m (2.8 kgf-m, 19.9 ft-lb)

7) Using new brake hose gaskets, connect the brake hose.

Tightening torque:

18 N-m (1.8 kgf-m, 13.0 ft-lb)

8) Bleed air from the brake system.

2. 16-INCH TYPE

Refer to 15-inch type. <Ref. to BR-17, 15-INCH TYPE, INSTALLATION, Front Disc Brake Assembly.>

3. 17-INCH TYPE

1) Install the support on housing.

Tightening torque:

80 N-m (8.2 kgf-m, 59 ft-lb)

2) Apply a thin coat of Molykote M7439 to pad clip.

3) Apply a thin coat of Molykote AS880N (Part No. K0777YA010) to the frictional portion between pad and inner shim.

4) Apply a thin coat of Molykote AS880N (Part No. K0779YA010) to the three frictional portions between inner shim and outer shim of outer pads.

5) Install the pad on support.

NOTE:
Install the pad indicator in proper direction.

- (1) LH – IN
- (2) LH – OUT
- (3) RH – IN
- (4) RH – OUT
- (5) Pad indicator
- (6) Pad return spring

CAUTION:

- Be sure to install so that the direction of pad return spring faces to the input side of brake rotor rotation direction as shown in the figure.
- Correctly install the pad return spring to supporting surface of pad clip as shown in the figure.
- When the pad return spring is deformed or damaged, replace the brake pad with new one.

- (1) Pad return spring
- (2) Supporting surface of pad clip
- (3) Brake rotor rotation direction

- 6) Install the caliper body on support.
- 7) Using new brake hose gaskets, connect the brake hose.

Tightening torque:
18 N·m (1.8 kgf·m, 13.0 ft·lb)

- 8) Bleed air from brake system.

C: DISASSEMBLY

1. 15-INCH TYPE

- 1) Clean mud and foreign particles from the caliper body assembly and the support.

CAUTION:

Be careful not to allow foreign particles to enter the brake hose connector.

- 2) Place a wooden block in caliper body as shown in the figure to prevent piston from jumping out and avoid being damaged.
- 3) Gradually supply compressed air via installation hole of brake hose to force the piston out.

- (1) Place a 30 mm (1.18 in) wide wood block here.

- 4) Remove the piston boot.

- 5) Remove the piston seal from caliper body cylinder.

Front Disc Brake Assembly

BRAKE

CAUTION:

Do not damage the cylinder and piston seal groove.

(1) Piston seal

6) Remove the guide pin and boot from caliper body.

2. 16-INCH TYPE

Refer to 15-inch type. <Ref. to BR-19, 15-INCH TYPE, DISASSEMBLY, Front Disc Brake Assembly.>

3. 17-INCH TYPE

Refer to 15-inch type. <Ref. to BR-19, 15-INCH TYPE, DISASSEMBLY, Front Disc Brake Assembly.>

D: ASSEMBLY

1. 15-INCH TYPE

- 1) Clean the caliper body interior using brake fluid.
- 2) Apply a coat of brake fluid to the piston seal and fit piston seal in groove on caliper body.
- 3) Apply a coat of brake fluid to the entire inner surface of cylinder and outer surface of piston.
- 4) Apply a coat of specified grease to the boot and fit in to the groove on the ends of cylinder.

Grease:

NIGLUBE RX-2 (Part No. K0779GA102)

5) Insert the piston into cylinder.

CAUTION:

Do not force the piston into cylinder.

(1) Piston
(2) Piston boot

6) Position the boot in the grooves on cylinder and piston.

(1) Piston
(2) Piston boot
(3) Caliper body
(4) Piston seal

7) Apply a coat of specified grease to the lock pin and guide pin outer surface, cylinder inner surface, and boot grooves.

Grease:

NIGLUBE RX-2 (Part No. K0779GA102)

8) Install the lock pin and guide pin boot on support.

(1) Pin boot
(2) Lock pin or guide pin
(3) Apply grease.

2. 16-INCH TYPE

Refer to 15-inch type. <Ref. to BR-20, 15-INCH TYPE, ASSEMBLY, Front Disc Brake Assembly.>

3. 17-INCH TYPE

Refer to 15-inch type. <Ref. to BR-20, 15-INCH TYPE, ASSEMBLY, Front Disc Brake Assembly.>

E: INSPECTION

- 1) Repair or replace the faulty parts.
- 2) Check the caliper body and piston for uneven wear, damage or rust.
- 3) Check the rubber parts for damage and deterioration.

5. Rear Brake Pad

A: REMOVAL

- 1) Lift-up the vehicle, and then remove the rear wheels.
- 2) Remove the caliper bolt.

- 3) Raise the caliper body and support it.

NOTE:

Do not disconnect the brake hose from caliper body.

- 4) Remove the pad.

NOTE:

If the brake pad is difficult to remove, use the same procedure as for front disc brake pad.

<Ref. to BR-13, REMOVAL, Front Brake Pad.>

B: INSTALLATION

- 1) Apply a thin coat of Molykote M7439 to pad clip.

- 2) Apply a thin coat of Molykote AS880N (Part No. K0777YA010) to the frictional portion between pad and shim.

- 3) Install the pad on support.
- 4) Install the caliper body on support.

Tightening torque:

Solid disc brake model

27 N·m (2.8 kgf-m, 19.9 ft-lb)

Ventilated disc brake model

37 N·m (3.7 kgf-m, 27.2 ft-lb)

C: INSPECTION

Check the pad thickness A.

Type of disc rotor		Solid	Ventilated
Pad thickness mm (in)	Standard value	9.0 (0.35)	9.0 (0.35)
	Wear limit	1.5 (0.059)	1.5 (0.059)

NOTE:

- Always replace the pads for both right and left wheels as a set.
- Also replace pad clips if they are twisted or worn.
- A wear indicator is provided on the inner disc brake pad. If the pad wears down to such an extent that the end of wear indicator contacts disc rotor, a squeaking sound is produced as the wheel rotates. If this sound is heard, replace the pad.
- Replace the pad if there is oil or grease on it.

6. Rear Disc Rotor

A: REMOVAL

- 1) Lift-up the vehicle, and then remove the rear wheels.
- 2) Release the parking brake.
- 3) Remove the two mounting bolts, and remove the disc brake assembly.

- 4) Suspend the disc brake assembly so that the hose is not stretched.
- 5) Remove the disc rotor.

NOTE:

If the disc rotor is difficult to remove, try following two methods in order.

- (1) Turn the adjusting screw using a flat tip screwdriver until the brake shoe gets away enough from the disc rotor.

- (1) Adjusting screw
- (2) Cover
- (3) Flat tip screwdriver
- (4) Back plate

- (2) If the disc rotor seizes up within hub, drive the disc rotor out by pushing with an 8 mm bolt in holes B on the rotor.

B: INSTALLATION

- 1) Install in the reverse order of removal.
- 2) Adjust the parking brake. <Ref. to PB-8, ADJUSTMENT, Parking Brake Assembly (Rear Disc Brake).>

C: INSPECTION

- 1) Check rear wheel bearing play and axial hub runout before disc rotor runout limit inspection. <Ref. to DS-21, INSPECTION, Rear Hub Unit Bearing.>
- 2) Secure the disc rotor by tightening five wheel nuts.
- 3) Set a dial gauge 10 mm (0.39 in) inward of the rotor outer perimeter. Turn the disc rotor to check runout. If the disc rotor runout exceeds the service limit, resurface the disc rotor. After resurfacing, check disc rotor thickness as in step 4.

Disc rotor runout limit: 0.05 mm (0.0020 in)

- 4) Set a micrometer 10 mm (0.39 in) inward of the rotor outer perimeter, and then measure the disc rotor thickness. If the thickness of disc rotor ex-

Rear Disc Rotor

BRAKE

ceeds the service limit, replace with a new disc rotor.

		Standard value	Limit	Disc outer dia.
Disc rotor thickness A mm (in)	Solid disc	10 (0.39)	8.5 (0.335)	274 (10.79)
	Ventilated disc	18 (0.71)	16 (0.63)	290 (11.42)

7. Rear Disc Brake Assembly

A: REMOVAL

CAUTION:

Do not allow brake fluid to come in contact with vehicle body; wash away with water and wipe off completely if spilled.

- 1) Lift-up the vehicle, and then remove the rear wheels.
- 2) Disconnect the brake hose from caliper body assembly.
- 3) Remove the caliper lower bolts.

- 4) Raise the caliper body, and then move it toward vehicle center to separate it from the support.
- 5) Remove the support from housing.

NOTE:

Remove the support only when replacing itself or rotor. It need not be removed when servicing the caliper body assembly.

- 6) Clean mud and foreign particles from the caliper body assembly and the support.

CAUTION:

Be careful not to allow foreign particles to enter the brake hose connector.

B: INSTALLATION

- 1) Install the support on housing.

Tightening torque:

53 N·m (5.4 kgf·m, 39.1 ft·lb)

- 2) Apply a thin coat of Molykote M7439 to pad clip.

- 3) Apply a thin coat of Molykote AS880N (Part No. K0777YA010) to the frictional portion between pad and shim.

- 4) Install the pad on support.
- 5) Install the caliper body on support.

Tightening torque:

Solid disc brake model

27 N·m (2.8 kgf·m, 19.9 ft·lb)

Ventilated disc brake model

37 N·m (3.7 kgf·m, 27.2 ft·lb)

- 6) Connect the brake hose using new brake hose gaskets.

Tightening torque:

18 N·m (1.8 kgf·m, 13.0 ft·lb)

- 7) Bleed air from the brake system.

C: DISASSEMBLY

- 1) Remove the piston boot.

- 2) Place a wooden block in caliper body as shown in the figure to prevent the piston from jumping out and avoid being damaged.

- 3) Gradually supply compressed air via installation hole of brake hose to force the piston out.

- (1) Place a 30 mm (1.18 in) wide wooden block here.

- 4) Remove the piston seal from caliper body cylinder.

Rear Disc Brake Assembly

BRAKE

CAUTION:

Do not damage the cylinder and piston seal groove.

- 5) Remove the lock pin sleeve and boot from caliper body.
- 6) Remove the guide pin boot.

D: ASSEMBLY

- 1) Clean the caliper body interior using brake fluid.
- 2) Apply a coat of brake fluid to the piston seal and fit piston seal in groove on caliper body.
- 3) Apply a coat of brake fluid to the entire inner surface of cylinder and outer surface of piston.
- 4) Apply a coat of specified grease to the boot and fit in to the groove on the ends of cylinder.

Grease:

NIGLUBE RX-2 (Part No. K0779GA102)

- 5) Insert the piston into cylinder.

CAUTION:

Do not force the piston into cylinder.

- 6) Position the boot in the grooves on cylinder and piston.

- (1) Piston
- (2) Piston boot
- (3) Caliper body
- (4) Piston seal

- 7) Apply a coat of specified grease to the guide pin, outer surface, sleeve outer surface, cylinder inner surface, and boot grooves.

Grease:

NIGLUBE RX-2 (Part No. K0779GA102)

- (1) Pin boot
- (2) Lock pin or guide pin
- (3) Apply grease.

- 8) Install the guide pin boot on support.
- 9) Install the lock pin boot on support, and then insert the lock pin sleeve into specified point.

E: INSPECTION

- 1) Repair or replace the faulty parts.
- 2) Check the caliper body and piston for uneven wear, damage or rust.
- 3) Check the rubber parts for damage or deterioration.

8. Master Cylinder

A: REMOVAL

CAUTION:

Do not allow brake fluid to come in contact with vehicle body; wash away with water and wipe off completely if spilled.

- 1) Thoroughly drain the brake fluid from reservoir tank.
- 2) Disconnect the fluid level gauge harness connector.
- 3) Remove the brake pipes from master cylinder.
- 4) Remove the master cylinder mounting nuts, and take out the master cylinder from brake booster.

B: INSTALLATION

- 1) Replace the O-ring for the master cylinder with a new one.

CAUTION:

Do not install the O-ring in wrong place.

- (1) Primary piston
- (2) O-ring
- (3) Do not install the O-ring on this groove.

- 2) Install in the reverse order of removal.

Tightening torque:

Master cylinder mounting nut

13 N·m (1.3 kgf-m, 9.6 ft-lb)

Piping flare nut

Model with ABS

15 N·m (1.5 kgf-m, 10.8 ft-lb)

Model with VDC

19 N·m (1.9 kgf-m, 14.0 ft-lb)

CAUTION:

Be sure to use recommended brake fluid.

- 3) Bleed air from brake system. <Ref. to BR-34, PROCEDURE, Air Bleeding.>

C: REPLACEMENT

- 1) Remove mud and dirt from the surface of brake master cylinder.
- 2) Secure the master cylinder on a vise.

NOTE:

To avoid damaging master cylinder, use aluminum plate while holding with vise.

- 3) Remove the pin which secures the reservoir tank to master cylinder, and then remove the reservoir tank and seal.

- 4) With pushing-in the primary piston, remove the C-ring using pliers.

- 5) With pushing-in the primary piston, remove the straight pin from the port on installation part of reservoir tank using magnet pick-up tool.

- (1) Straight pin

- 6) Extract the primary piston assembly and secondary piston assembly straight out, while taking care not to scratch the inner surface of cylinder.

- 7) Clean the inside of master cylinder with brake fluid. Check the inside of cylinder for damage, deform and wear. Replace the master cylinder as assembly if faulty.

- 8) Apply brake fluid to the inner surface of master cylinder and piston assembly.

Master Cylinder

BRAKE

9) Ensure that the inner surface of master cylinder and piston assembly are free of dirt before assembling. Install the primary piston assembly and secondary piston assembly, while taking care not to scratch the master cylinder inner surface.

10) With pushing-in the primary piston, install the cylinder pin.

11) With pushing-in the primary piston, install the C-ring to groove, using pliers.

D: INSPECTION

Inspect for oil leakage from the master cylinder.

NOTE:

After replacing piston kit, when the oil leakage is found without damaging or scratching the inside of cylinder, wear of master cylinder inner wall may be the cause. In this case, replace the master cylinder as assembly.

CAUTION:

Ensure the secure installation.

12) Install the seal to reservoir tank.

(1) Seal

13) Install the reservoir tank to master cylinder, and secure with pin.

14) Replace the O-ring for the master cylinder with a new one.

(1) Primary piston

(2) O-ring

(3) Do not install the O-ring on this groove.

9. Brake Booster

A: REMOVAL

1) Remove or disconnect the following parts at engine compartment.

- (1) Disconnect the connector for brake fluid level gauge.
- (2) Remove the brake pipes from master cylinder.
- (3) Remove the master cylinder installing nuts.
- (4) Disconnect the vacuum hose from brake booster.

2) Remove the following parts from pedal bracket.

- (1) Snap pin and clevis pin
- (2) Four brake booster installing nuts

- (1) Nut
- (2) Clevis pin
- (3) Snap pin
- (4) Operating rod

3) Remove the brake booster while shunning brake pipes.

NOTE:

- Do not apply strong impact to booster shell and vacuum pipe.
- Be careful not to drop the brake booster. The brake booster should be replaced if it has been dropped.
- Use special care when handling the operating rod. If excessive force is applied to operating rod sufficient to cause a change in the angle in excess of $\pm 3^\circ$, it may result in damage to the power piston cylinder.

- Use care when placing the brake booster on the floor.
- Do not change the push rod length.

CAUTION:

- Do not disassemble the brake booster.
- If external force is applied from above when brake booster is placed in this position, the resin portion as indicated by "P", may be damaged.

(1) Force

B: INSTALLATION

1) Check and adjust the operating rod of brake booster.

Standard L:

136.3 mm (5.38 in)

If it is not within the specified value, adjust it by adjusting the brake booster operating rod.

2) Mount the brake booster in position.

Brake Booster

BRAKE

3) Connect the operating rod to brake pedal with clevis pin and snap pin.

- (1) Nut
- (2) Clevis pin
- (3) Snap pin
- (4) Operating rod

NOTE:

Apply a thin coat of grease [SUNLIGHT 2 (Part No. 003602010)] to clevis pin.

- 4) Connect the vacuum hose to brake booster.
- 5) After replacing the O-ring with a new one, install the master cylinder to brake booster.

- (1) Primary piston
- (2) O-ring
- (3) Do not install the O-ring on this groove.

- 6) Connect the brake pipes to master cylinder.
- 7) Connect the connector for brake fluid level gauge.
- 8) Measure the clearance between the threaded end of stop light switch and stopper.

If it is not within specified value, adjust it by adjusting the position of stop light switch. <Ref. to BR-41, ADJUSTMENT, Stop Light Switch.>

CAUTION:

Be careful not to rotate the stop light switch.

Stop light switch clearance A:
0.3 mm (0.012 in)

- 9) Apply grease to the operating rod connecting pin to prevent it from wearing.
- 10) Bleed air from the brake system.

Tightening torque (Air bleeder screw):
8 N·m (0.8 kgf-m, 5.8 ft-lb)

- 11) Conduct road tests to ensure brakes do not drag.

C: INSPECTION

1. OPERATION CHECK (WITHOUT GAUGES)

CAUTION:

When checking operation, be sure to securely apply the parking brake.

• CHECKING WITHOUT GAUGES

This method cannot determine the exact portion which has failed. But it can provide a rough understanding of the nature of failure if checking is conducted in accordance with the following procedures.

• AIR TIGHTNESS CHECK

Start the engine, and idle it for 1 to 2 minutes, then turn it OFF. Depress the brake pedal several times applying the same pedal force as that used in ordinary braking operations. The pedal stroke should be greatest on the 1st depression, and it should become smaller with each successive depression. If

no change occurs in the pedal height while in a depressed state, the brake booster is faulty.

- (1) Normal operation
- (2) Not OK
- (3) 1st
- (4) 2nd
- (5) 3rd

NOTE:

- In the event of defective operation, also inspect the condition of the check valve and vacuum hose.
- Replace them if faulty and conduct the test again.
- If no improvement is observed, check precisely with gauges.

• OPERATION CHECK

1) With the engine OFF, depress the brake pedal several times applying the same pedal force and make sure that the pedal height does not vary with each depression of the pedal.

- (1) When engine is stopped
- (2) When engine is started

2) With the brake pedal depressed, start the engine.

3) As engine starts, the brake pedal should move slowly toward the floor. If no change occurs in the pedal height, the brake booster is faulty.

NOTE:

If faulty, check precisely with gauges.

• LOADED AIR TIGHTNESS CHECK

Depress the brake pedal while engine is running, and turn OFF the engine while the pedal is still depressed. Keep the pedal depressed for 30 seconds; if no change occurs in the pedal height, the brake booster is functioning normally; if the pedal height increases, it is faulty.

NOTE:

If faulty, check precisely with gauges.

2. OPERATION CHECK (WITH GAUGES)

CAUTION:

When checking operation, be sure to securely apply the parking brake.

• CHECKING WITH GAUGES

Connect gauges as shown in the figure. After bleeding air from pressure gauges, proceed to each check.

- (1) Pressure gauge
- (2) Vacuum gauge
- (3) Adapter hose
- (4) Vacuum hose
- (5) Pedal force gauge

• AIR TIGHTNESS CHECK

1) Start the engine and keep it running until a vacuum of 66.7 kPa (500 mmHg, 19.69 inHg) = point A is indicated on vacuum gauge. Do not depress the brake pedal at this moment.

- (1) Pressure gauge
- (2) Vacuum gauge

Brake Booster

BRAKE

2) Stop the engine and watch the gauge. If the vacuum drop range is less than 3.3 kPa (25 mmHg, 0.98 inHg) within 15 seconds after stopping the engine, brake booster is functioning properly. If defective, the cause may be one of those listed below.

- Check valve malfunction
- Leak from vacuum hose
- Leak from shell jointed portion or stud bolt welded portion
- Damaged diaphragm
- Leak from valve body seal and bearing portion
- Leak from plate and seal assembly portion
- Leak from poppet valve assembly portion

• LOADED AIR TIGHTNESS CHECK

1) Start the engine and depress the brake pedal with pedal force of 196 N (20 kgf, 44 lb). Keep the engine running until a vacuum of 66.7 kPa (500 mmHg, 19.69 inHg) = point B is indicated on vacuum gauge while the pedal is still depressed.

- (1) Pressure gauge
- (2) Vacuum gauge
- (3) Pedal force gauge
- (4) Depressed

2) Stop the engine and watch vacuum gauge. If the vacuum drop range is less than 3.3 kPa (25 mmHg, 0.98 inHg) within 15 seconds after stopping the engine, brake booster is functioning properly. If defective, refer to "AIR TIGHTNESS CHECK".

<Ref. to BR-30, INSPECTION, Brake Booster.>

3) If any fault is found on brake booster, replace the brake booster with a new one.

• LACK OF BOOSTING ACTION CHECK

Turn OFF the engine, and set the vacuum gauge reading at "0". Then, check the fluid pressure when brake pedal is depressed. The pressure must be greater than the standard value listed.

Brake pedal force N (kgf, lb)	147 (15, 33)	294 (30, 66)
Fluid pressure kPa (kg/cm ² , psi)	545 (6, 79)	1,564 (16, 227)

• BOOSTING ACTION CHECK

Set the vacuum gauge reading at 66.7 kPa (500 mmHg, 19.69 inHg) by running engine. Then, check the fluid pressure when brake pedal is depressed. The pressure must be greater than the standard value listed.

Brake pedal force N (kgf, lb)		147 (15, 33)	294 (30, 66)
Fluid pressure kPa (kg/cm ² , psi)	15" 16" OUT- BACK	6,003 (61, 871)	11,273 (115, 1,635)
	16" (Except for OUT- BACK)	5,381 (55, 780)	10,982 (112, 1,593)
	17"	4,963 (51, 720)	10,055 (103, 1,458)

10. Brake Fluid

A: INSPECTION

1) Check that the brake fluid level is between “MIN” and “MAX”. If out of the specified range, refill or drain fluid. If the fluid level becomes close to “MIN”, check the brake pad and refill fluid.

2) Check the fluid for discoloration. If the fluid color has excessively changed, drain the fluid and refill with new fluid.

B: REPLACEMENT

CAUTION:

- Do not allow brake fluid to come in contact with vehicle body; wash away with water and wipe off completely if spilled.
- Avoid mixing different brands of brake fluid to prevent degrading the quality of fluid.
- Be careful not to allow dirt or dust to get into the reservoir tank.

NOTE:

- During the operation, keep the brake reservoir tank filled with brake fluid to eliminate entry of air.
 - The brake pedal operating must be very slow.
 - For convenience and safety, two people should do the work.
 - The amount of brake fluid required is approximately 500 mℓ (16.9 US fl oz, 17.6 Imp fl oz) for total brake system.
- 1) Either lift-up the vehicle to place a rigid racks under it, or lift-up the vehicle.
 - 2) Remove both the front and rear wheels.
 - 3) Drain brake fluid from the reservoir tank.
 - 4) Refill the reservoir tank with recommended brake fluid.

Recommended brake fluid:

Refer to the specification. <Ref. to BR-2, SPECIFICATION, General Description.>

Perform the same procedure as bleeding operation of brake line until the new brake fluid coming out from vinyl tube. <Ref. to BR-34, PROCEDURE, Air Bleeding.>

NOTE:

Perform the brake fluid replacement in order from the farthest wheel cylinder from master cylinder.

11. Air Bleeding

A: PROCEDURE

CAUTION:

- Do not allow brake fluid to come in contact with vehicle body; wash away with water and wipe off completely if spilled.
- Avoid mixing different brands of brake fluid to prevent degrading the quality of fluid.
- Be careful not to allow dirt or dust to get into the reservoir tank.

1. MASTER CYLINDER

NOTE:

- If the master cylinder is disassembled or reservoir tank is empty, bleed the master cylinder.
- If bleeding the master cylinder is not necessary, bleed the brake line without doing the procedure below. <Ref. to BR-34, BRAKE LINE, PROCEDURE, Air Bleeding.>

1) Fulfill the reservoir tank of master cylinder with brake fluid.

NOTE:

- During the operation, keep the reservoir tank filled with brake fluid to eliminate entry of air.
- 2) Disconnect the brake line at primary and secondary sides.
 - 3) Put a plastic bag cover on master cylinder.
 - 4) Slowly depress the brake pedal and hold it.

5) Close the outlet plug with your finger, and then return the brake pedal.

- 6) Repeat the step 4) and 5) several times.
- 7) Remove the plastic bag.

8) Install the brake pipes to master cylinder.

Tightening torque:

Model with ABS

15 N·m (1.5 kgf·m, 10.8 ft·lb)

Model with VDC

18 N·m (1.8 kgf·m, 13.0 ft·lb)

9) Bleed air from the brake line. <Ref. to BR-34, BRAKE LINE, PROCEDURE, Air Bleeding.>

2. BRAKE LINE

- 1) If the master cylinder is disassembled or reservoir tank is empty, bleed the master cylinder before bleeding the brake line. <Ref. to BR-34, MASTER CYLINDER, PROCEDURE, Air Bleeding.>
- 2) Fulfill the reservoir tank of the master cylinder with brake fluid.

NOTE:

- During the bleeding operation, keep the reservoir tank filled with brake fluid to eliminate entry of air.
- 3) Fit one end of vinyl tube into the air bleeder and put the other end into a brake fluid container.

- 4) Several times depress the brake pedal and keep it.
- 5) Loosen the air bleeder screws to discharge the brake fluid. With the air bleeder tightened quickly, release the brake pedal.
- 6) Repeat the steps 4) and 5) until there are no more air bubbles in the vinyl tube.
- 7) Repeat the steps above from 2) to 6) in order to bleed each wheel.

NOTE:

- Perform the operation in order from the closest wheel cylinder to the master cylinder.
- 8) Tighten the air bleeder screws securely.

Tightening torque:

8 N·m (0.8 kgf·m, 5.8 ft·lb)

- 9) Inspect that there is no brake fluid leak evident in the entire system.
- 10) Check the pedal stroke. While the engine is idling after warming up, depress the brake pedal with a 500 N (51 kgf, 112 lb) load and measure the distance between brake ped-

al and steering wheel. With the brake pedal released, measure the distance between pedal and steering wheel again.

- (1) Steering wheel
- (2) Toe board

Specified pedal stroke:

When depressing brake pedal with a 500 N (51 kgf, 112 lb) load.

95 mm (3.74 in) or less

- 11) If it is more than specified, there is a possibility that air is in the brake line. Bleed the brake line until pedal stroke meets the specification.
- 12) Operate the hydraulic control unit in the sequence control mode. <Ref. to ABS-10, ABS Sequence Control.>
- 13) Recheck the pedal stroke.
- 14) If it is more than specified, there is a possibility that air is in the inside of the hydraulic unit. Repeat above steps 2) to 9) until pedal stroke meets the specification.
- 15) Add brake fluid to the required level ("MAX" level) of reservoir tank.
- 16) Test run the vehicle and ensure that brakes provide normal braking action.

12.Brake Hose

A: REMOVAL

1. FRONT BRAKE HOSE

- 1) Separate the brake pipe from brake hose using a flare nut wrench.
- 2) Remove the clamp, bolt at strut mount, and union bolt.

- (1) Brake hose
- (2) Brake pipe

2. REAR BRAKE HOSE

- 1) Remove the union bolt from rear brake caliper.

- (1) Brake hose

- 2) Separate the brake pipe from brake hose using a flare nut wrench.

- 3) Remove the clamp and remove the brake hose.

- (1) Brake pipe
- (2) Brake hose clamp

- (1) Brake pipe
- (2) Brake hose
- (3) Brake hose clamp

B: INSTALLATION

1. FRONT BRAKE HOSE

- 1) Secure the brake hose to strut mount.

Tightening torque:

33 N·m (3.4 kgf-m, 24.3 ft-lb)

- 2) Install the brake hose to caliper using a new gasket.

Tightening torque (Union bolt):

18 N·m (1.8 kgf-m, 13.0 ft-lb)

- 3) Position the disc in straight-forward direction and route the brake hose through the hole in bracket on wheel apron side.

CAUTION:

Be sure the brake hose is not twisted.

- 4) Temporarily tighten the flare nut to connect the brake pipe and hose.
- 5) Fix the brake hose with clamp at wheel apron bracket.
- 6) Tighten the flare nut to specified torque.

Tightening torque (Brake pipe flare nut):
15 N·m (1.5 kgf-m, 10.8 ft-lb)

- 7) Bleed air from brake system.

2. REAR BRAKE HOSE

- 1) Pass the brake hose through the hole of bracket, and lightly tighten the flare nut to connect brake pipe.
- 2) Insert the clamp upward to fix brake hose.

- (1) Brake pipe
- (2) Brake hose
- (3) Brake hose clamp

- (1) Brake pipe
- (2) Brake hose clamp

- 3) Install the brake hose to rear brake caliper using a new gasket.

Tightening torque (Union bolt):
18 N·m (1.8 kgf-m, 13.0 ft-lb)

- (1) Brake hose

- 4) Tighten the flare nut to specified torque.

Tightening torque (Brake pipe flare nut):
15 N·m (1.5 kgf-m, 10.8 ft-lb)

- 5) Bleed air from the brake system.

C: INSPECTION

Ensure there are no cracks, breakage or damage on hoses. Check joints for fluid leakage. If any cracks, breakage, damage or fluid leakage is found, repair or replace the hose.

13. Brake Pipe

A: REMOVAL

NOTE:

Airbag system wiring harness is routed near the center brake pipe.

CAUTION:

- All airbag system wiring harness and connectors are colored yellow. Do not use the electrical test equipment on these circuits.
- Be careful not to damage the airbag system wiring harness when servicing the center brake pipe.
- When removing the brake pipe, make sure that it is not bent.

B: INSTALLATION

NOTE:

Airbag system wiring harness is routed near the center brake pipe.

CAUTION:

- All airbag system wiring harness and connectors are colored yellow. Do not use the electrical test equipment on these circuits.
- Be careful not to damage the airbag system wiring harness when servicing the center brake pipe.
- When installing the brake pipe, make sure that it is not bent.
- After installing the brake pipe and hose, bleed air.
- After installing the brake hose, make sure that it does not touch the tire or suspension assembly, etc.

Brake pipe tightening torque:

<Ref. to BR-7, FRONT BRAKE PIPES AND HOSE, COMPONENT, General Description.>

<Ref. to BR-8, CENTER AND REAR BRAKE PIPES AND HOSE, COMPONENT, General Description.>

C: INSPECTION

Ensure there are no cracks, breakage or damage on pipes. Check joints for fluid leakage. If any cracks, breakage, damage or fluid leakage is found, repair or replace the pipes.

NOTE:

Use a mirror when inspecting the low-visible part or backside.

14. Brake Pedal

A: REMOVAL

1. MT MODEL

- 1) Remove the steering shaft.
- 2) Disconnect the connectors (stop light switch) from pedal bracket.
- 3) Remove the clevis pin which secures lever to push rod.
- 4) Remove the nuts which secure clutch master cylinder.
- 5) Remove the bolts and nuts which secure pedal bracket.

2. AT MODEL

- 1) Remove the steering shaft.
- 2) Disconnect the connectors (stop light switch) from pedal bracket.
- 3) Remove the clevis pin which secures lever to push rod.

- 4) Remove the bolts and nuts which secure pedal bracket.

- (1) Clevis pin
- (2) Snap pin
- (3) Operating rod

B: INSTALLATION

- 1) Install in the reverse order of removal.

CAUTION:

Always use new clevis pins.

- 2) Inspect the brake pedal after installation. <Ref. to BR-39, INSPECTION, Brake Pedal.>

C: INSPECTION

- 1) Move the brake pedal pads in the lateral direction with a force of approx. 10 N (1 kgf, 2 lb) to ensure pedal deflection is in specified range.

CAUTION:

If excessive deflection is noted, replace the bushing with a new one.

Brake Pedal

BRAKE

Deflection of brake pedal:

Limit

5.0 mm (0.197 in) or less

(1) Brake pedal

2) Check the position of pedal pad.

Pedal height L:

150 — 160 mm (5.91 — 6.30 in)

Brake pedal free play A:

0.5 — 2 mm (0.02 — 0.08 in) [When the brake pedal is pulled upward with force of less than 10 N (1 kgf, 2 lb).]

- (1) Stop light switch
- (2) Mat
- (3) Toe board
- (4) Brake booster operating rod

3) If it is not within the specified value, adjust it by adjusting the brake booster operating rod length.

15. Stop Light Switch

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Disconnect the stop light switch connector.
- 3) Loosen the nuts, and unscrew the stop light switch to remove.

(1) Stop light switch

B: INSTALLATION

- 1) Screw the stop light switch onto a bracket and secure it temporarily with a nut.
 - 2) Adjust the stop light switch position, and then tighten the nut.
- <Ref. to BR-41, ADJUSTMENT, Stop Light Switch.>

Tightening torque:

8 N·m (0.8 kgf-m, 5.8 ft-lb)

C: INSPECTION

- 1) If the stop light switch does not operate properly (or if it does not fix at the specified position), replace with a new one.

Specified position L:
2 mm (0.079 in)

- 2) Measure the clearance between the threaded end of stop light switch and stopper.

CAUTION:

Be careful not to rotate the stop light switch.

Stop light switch clearance A:
0.3 mm (0.012 in)

- (1) Stop light switch
- (2) Stopper
- (3) Brake pedal

- 3) If it is not within the specified value, adjust it by adjusting the position of stop light switch.

CAUTION:

Be careful not to rotate the stop light switch.

D: ADJUSTMENT

Loosen the lock nut, and adjust the stop light switch position until the clearance between the threaded end of the stop light switch and stopper (A) becomes 0.3 mm (0.012 in). Then, tighten the lock nut.

Stop Light Switch

BRAKE

Tightening torque:

8 N·m (0.8 kgf-m, 5.8 ft-lb)

- (1) Stop light switch
- (2) Lock nut A
- (3) Lock nut B
- (4) Stopper
- (5) Brake pedal

NOTE:

Tighten the lock nut B until the clearance between the threaded end of stop light switch and stopper becomes 0 mm (0 inch). Hold the stop light switch to prevent turning, and then loosen the lock nut B approx. 60°. The clearance (A) becomes 0.3 mm (0.012 in).

16. General Diagnostic Table

A: INSPECTION

	Trouble and possible cause	Corrective action
1. Insufficient braking	(1) Fluid leakage from the hydraulic mechanism	Correct or replace. (cup, piston seal, piston boot, master cylinder piston kit, pipe or hose)
	(2) Entry of air into the hydraulic mechanism	Bleed air.
	(3) Wear, deteriorated surface material, adhering water or fluid on the lining	Replace, grind or clean.
	(4) Improper operation of master cylinder, disc caliper, brake booster or check valve	Correct or replace.
2. Unstable or uneven braking	(1) Fluid on the lining or rotor	Eliminate cause of fluid leakage, and clean or replace.
	(2) Rotor eccentricity	Correct or replace the rotor.
	(3) Improper lining contact, deteriorated surface material, improper inferior material, or wear	Correct by grinding, or replace.
	(4) Deformed back plate	Rectify or replace.
	(5) Improper tire inflation	Adjust to correct pressure.
	(6) Disordered wheel alignment	Adjust alignment.
	(7) Loosened back plate or the support installing bolts	Retighten to specified torque.
	(8) Faulty wheel bearing	Replace.
	(9) Trouble in hydraulic system	Replace the cylinder, brake pipe or hose.
	(10) Uneven effect of the parking brake	Check, adjust, or replace the rear brake and cable system.
3. Excessive pedal stroke	(1) Entry of air into the hydraulic mechanism	Bleed air.
	(2) Excessive play in the master cylinder push rod	Adjust.
	(3) Fluid leakage from the hydraulic mechanism	Correct or replace. (cup, piston seal, piston boot, master cylinder piston kit, pipe or hose)
	(4) Improper lining contact or worn lining	Correct or replace.
4. Brake dragging or improper brake return	(1) Insufficient pedal play	Adjust play.
	(2) Improper master cylinder return	Clean or replace the cylinder.
	(3) Clogged hydraulic system	Replace.
	(4) Improper return or adjustment of parking brake	Correct or adjust.
	(5) Weakened spring tension or breakage of shoe return spring	Replace the spring.
	(6) Improper disc caliper operation	Correct or replace.
	(7) Faulty wheel bearing	Replace.
5. Brake noise (1) (creak sound)	(1) Hardened or deteriorated brake pad	Replace the pad.
	(2) Worn brake pad	Replace the pad.
	(3) Loosened back plate or the support installing bolts	Retighten to specified torque.
	(4) Loose wheel bearing	Retighten to specified torque.
	(5) Dirty rotor	Clean the rotor, or clean and replace brake assembly.
6. Brake noise (2) (hissing sound)	(1) Worn brake pad	Replace the pad.
	(2) Improper installed pad	Correct or replace the pad.
	(3) Loose or bent rotor	Retighten or replace.
7. Brake noise (3) (click sound)	Excessively worn pad or the support	Replace the pad or the support.

General Diagnostic Table

BRAKE

General Description

PARKING BRAKE

1. General Description

A: SPECIFICATION

Type		Mechanical on rear brakes, drum in disc
Effective drum diameter	mm (in)	170 (6.69)
Lining dimensions (length × width × thickness)	mm (in)	163.1 × 30.0 × 3.2 (6.421 × 1.181 × 0.126)
Clearance adjustment		Manual adjustment
Lever stroke	notches/N (kgf, lb)	5 to 6/200 (20.4, 45)

B: COMPONENT

1. PARKING BRAKE (REAR DISC BRAKE)

PB-00048

- | | | |
|------------------------------------|------------------------------|----------------------------|
| (1) Back plate | (7) Strut spring | (13) Adjuster |
| (2) Retainer | (8) Strut | (14) Shoe hold-down cup |
| (3) Spring washer | (9) Shoe guide plate | (15) Shoe hold-down spring |
| (4) Lever | (10) Primary return spring | (16) Shoe hold-down pin |
| (5) Parking brake shoe (Primary) | (11) Secondary return spring | (17) Adjusting hole cover |
| (6) Parking brake shoe (Secondary) | (12) Adjusting spring | |

2. PARKING BRAKE CABLE

PB-00056

- | | |
|--------------------------------------|----------------------------|
| (1) Parking brake lever | (6) Clamp |
| (2) Parking brake switch | (7) Parking brake cable RH |
| (3) Adjusting nut (Self-locking nut) | (8) Clamp |
| (4) Equalizer | (9) Parking brake cable LH |
| (5) Bracket | |

Tightening torque: N·m (kgf·m, ft·lb)

T1: 18 (1.8, 13.0)

T2: 33 (3.4, 24.3)

C: CAUTION

- Wear work clothing, including a cap, protective goggles, and protective shoes during operation.
- Before removal, installation or disassembly, be sure to clarify the failure. Avoid unnecessary removal, installation, disassembly and replacement.
- Be careful not to burn your hands, because each part on the vehicle is hot after running.
- Use SUBARU genuine grease etc. or the equivalent. Do not mix grease etc. with that of another grade or from other manufacturers.
- Be sure to tighten fasteners including bolts and nuts to the specified torque.
- Place shop jacks or rigid racks at the specified points.
- Before securing a part on a vice, place cushioning material such as wood blocks, aluminum plate, or shop cloth between the part and the vice.
- Keep grease etc. away from parking brake shoes.

2. Parking Brake Lever

A: REMOVAL

- 1) Set the wheel stoppers to tires.
- 2) Remove the console box.
- 3) Disconnect the parking brake switch connector.
- 4) Remove the parking cable adjusting nut (self-locking nut).
- 5) Remove the parking brake lever.

B: INSTALLATION

- 1) Install in the reverse order of removal.

Tightening torque:

Parking brake lever

18 N·m (1.8 kgf·m, 13.0 ft·lb)

- 2) Install a new adjusting nut (self-locking nut).
- 3) Adjust the lever stroke. <Ref. to PB-4, ADJUSTMENT, Parking Brake Lever.>

C: INSPECTION

- 1) Operate the parking brake lever 3 to 4 times and return the lever fully.
- 2) While pulling the parking brake lever upward, count the notches.

Lever stroke:

5 to 6 notches when pulled with a force of 200 N (20.4 kgf, 45 lb)

If it is not within the specified value, adjust the parking brake. <Ref. to PB-8, ADJUSTMENT, Parking Brake Assembly (Rear Disc Brake).>

D: ADJUSTMENT

Adjust the parking lever stroke. <Ref. to PB-8, LEVER STROKE, ADJUSTMENT, Parking Brake Assembly (Rear Disc Brake).>

3. Parking Brake Cable

A: REMOVAL

- 1) Remove the rear seat cushion.
- 2) Remove the console box.
- 3) Remove the parking cable adjusting nut (self-locking nut).
- 4) Remove the parking brake lever. <Ref. to PB-4, REMOVAL, Parking Brake Lever.>
- 5) Roll up the floor mat and remove the clamps.

- 6) Remove the inner cable end from equalizer.

- (1) Equalizer
- (2) Inner cable end

- 7) Lift-up the vehicle, and then remove the rear wheels.
- 8) Remove the parking brake cable from rear brake. <Ref. to PB-6, REMOVAL, Parking Brake Assembly (Rear Disc Brake).>
- 9) Remove the clamp from rear brake.
- 10) Remove the cable clamp from rear arm bracket.
- 11) Remove the cable clamp from rear floor.

- 12) Remove the cable assembly.

B: INSTALLATION

- 1) Install in the reverse order of removal.

NOTE:

Be sure to pass the cable through the cable guide inside tunnel.

- 2) Adjust the lever stroke. <Ref. to PB-4, ADJUSTMENT, Parking Brake Lever.>

C: INSPECTION

Check and replace the removed cable if damaged, rusty or faulty.

- 1) Check the cable for smooth operation.
- 2) Check the inner cable for damage and rust.
- 3) Check the outer cable for damage, bends and cracks.
- 4) Check the boot for damage, cracks and corrosion.

Parking Brake Assembly (Rear Disc Brake)

PARKING BRAKE

4. Parking Brake Assembly (Rear Disc Brake)

A: REMOVAL

- 1) Release the parking brake.
- 2) Remove the two mounting bolts and remove the brake caliper assembly.

- 3) Suspend the brake caliper assembly so that the hose is not stretched.
- 4) Remove the disc rotor.

NOTE:

If the disc rotor is difficult to remove, try the following two methods in order.

- (1) Turn the adjusting screw using a flat tip screwdriver until the brake shoe gets away enough from the disc rotor.

- (1) Adjuster
- (2) Adjusting hole cover (rubber)
- (3) Flat tip screwdriver
- (4) Back plate

- (2) If the disc rotor seizes up within hub, drive out the disc rotor by pushing two 8 mm bolts in holes B on rotor.

- 5) Remove the shoe return spring from parking brake assembly.
- 6) Remove the front shoe hold down spring and pin.

- 7) Remove the strut and strut spring.
- 8) Remove the adjuster assembly from parking brake assembly.
- 9) Remove the brake shoe.
- 10) Remove the rear shoe hold down spring and pin with pliers.
- 11) Remove the parking brake cable from lever.

- (1) Parking brake cable
- (2) Lever

- 12) Using a flat tip screwdriver, raise the retainer. Remove the parking lever and washer from brake shoe.

B: INSTALLATION

CAUTION:

Be sure the lining surface is free from oil and grease contamination.

1) Apply brake grease to the following places.

Brake grease:

Brake Grease (Part No. 003602002)

- Six contact surfaces of shoe rim and back plate packing
 - Contact surface of shoe wave and anchor pin
 - Contact surface of lever and strut
 - Contact surface of shoe wave and adjuster assembly
 - Contact surface of shoe wave and strut
 - Contact surface of lever and shoe wave
- 2) Insert the primary side brake shoe into anchor pin groove.
- 3) Secure the brake shoe with the shoe hold-down pin and cup.
- 4) Install the plate to anchor pin, and then assemble the primary return spring to anchor pin.

- (1) Primary return spring
- (2) Anchor pin
- (3) Plate
- (4) Primary shoe
- (5) Shoe hold-down pin and shoe hold-down cup

5) Install the parking brake cable to parking brake lever.

6) Assemble the strut and adjuster, and then secure the secondary side brake shoe with shoe hold-down pin and cup.

NOTE:

- Install the strut spring of both right and left wheel facing vehicle front.

- Install the adjuster assembly with screw on left side.

(1) LH

7) Install the secondary return spring and adjusting spring.

- (1) Lever
- (2) Secondary brake shoe
- (3) Strut spring
- (4) Strut
- (5) Return spring
- (6) Adjuster
- (7) Shoe hold-down cup
- (8) Adjusting spring

8) Adjust the parking brake. <Ref. to PB-8, ADJUSTMENT, Parking Brake Assembly (Rear Disc Brake).>

9) Drive the vehicle for parking brake lining "break-in".

- (1) Drive the vehicle at about 35 km/h (22 MPH).
 - (2) With the parking brake release button pushed in, pull the parking brake lever gently.
 - (3) Drive the vehicle for about 200 m (0.12 mile) in this condition.
 - (4) Wait 5 to 10 minutes for the parking brake to cool down.
- Repeat once more from step (1).
- (5) After breaking-in, re-adjust the parking brakes.

Parking Brake Assembly (Rear Disc Brake)

PARKING BRAKE

C: INSPECTION

1) Measure the brake disc rotor inside diameter. If the disc is scored or worn, replace the brake disc rotor.

Disc rotor inside diameter:

Standard:

170 mm (6.69 in)

Service limit:

171 mm (6.73 in)

2) Measure the lining thickness. If it exceeds the limit, replace shoe assembly.

Lining thickness:

Standard:

3.2 mm (0.126 in)

Service limit:

1.5 mm (0.059 in)

NOTE:

Replace the right and left brake shoe as a set.

D: ADJUSTMENT

1. SHOE CLEARANCE

- 1) Return the parking brake lever fully.
- 2) Remove the adjusting hole cover from back plate.
- 3) Turn the adjusting screw using a flat tip screwdriver until the brake shoe is in close contact with disc rotor.

- (1) Adjusting screw
- (2) Adjusting hole cover (rubber)
- (3) Flat tip screwdriver
- (4) Back plate

4) Turn back (downward) the adjusting screw 3 to 4 notches.

CAUTION:

Check there is no brake drag.

- 5) Install the adjusting hole cover to back plate.
- 6) Adjust the parking lever stroke. <Ref. to PB-8, LEVER STROKE, ADJUSTMENT, Parking Brake Assembly (Rear Disc Brake).>

2. LEVER STROKE

- 1) Adjust the shoe clearance before lever stroke adjustment. <Ref. to PB-8, SHOE CLEARANCE, ADJUSTMENT, Parking Brake Assembly (Rear Disc Brake).>
- 2) Remove the parking lever cover.
- 3) Operate the parking brake lever 3 to 4 times.
- 4) Turn the adjusting nut until lever stroke is at the specification.

Lever stroke:

5 to 6 notches when pulled with a force of 200 N (20.4 kgf, 45 lb)

- (1) Adjusting nut (Self-locking nut)

- 5) Check there is no brake drag.
- 6) Install the parking lever cover.

5. General Diagnostic Table

A: INSPECTION

Symptom	Possible cause	Remedy
Brake drag	Parking brake lever is maladjusted.	Adjustment.
	Parking brake cable does not move.	Repair or replace.
	Parking brake shoe clearance is maladjusted.	Adjustment.
	Return spring is faulty.	Replace.
Noise from brake	Return spring is faulty.	Replace.
	Shoe hold-down spring is faulty.	Replace.

General Diagnostic Table

PARKING BRAKE

General Description

POWER ASSISTED SYSTEM (POWER STEERING)

1. General Description

A: SPECIFICATION

Model		OUTBACK Except for 3.0 R	OUTBACK 3.0 R
Whole system	Minimum turning radius	m (ft) 5.4 (17.8)	
	Steering angle	Inner wheel	Except for OUTBACK: 37.2°±1.5°, OUTBACK: 38.0°±1.5°
		Outer wheel	Except for OUTBACK: 33.0°±1.5°, OUTBACK: 33.7°±1.5°
	Steering wheel diameter	mm (in) 375 (14.76)	
Lock to lock turn		Except for 2.5 GT: 3.2, 2.5 GT: 2.8	
Gearbox	Type	Rack and Pinion, Integral	
	Backlash	0 (Automatically adjustable)	
	Valve (Power steering system)	Rotary valve	
Pump (Power steering system)	Type	Vane pump	
	Oil tank	Installed on body	
	Specific output	cm ³ (cu in)/rev. 8.5 (0.519)	9.6 (0.586)
	Relief pressure	kPa (kg/cm ² , psi) 7,350 — 8,036 (75 — 82, 1,067 — 1,165)	8,300 — 9,000 (85 — 92, 1,204 — 1,305)
	Hydraulic fluid control	Dropping in response to increased engine revolutions	
	Hydraulic fluid	ℓ (US qt, Imp qt) 1,000 rpm: 6.15 (6.5, 5.4) 3,000 rpm: 5.5 (5.8, 4.8)	1,000 rpm: 6.5 (6.9, 5.7) 3,000 rpm: 5.5 (5.8, 4.8)
	Range of revolution	rpm 680 — 9,600	
Revolving direction		Clockwise	
Working fluid (Power steering system)	Fluid	ATF DEXRON III or equivalent	
	Capacity ℓ (US qt, Imp qt)	Oil tank	0.2 (0.2, 0.2)
		Whole system	0.7 (0.7, 0.6)

Steering wheel	Free play	mm (in)	17 (0.67)
Steering shaft	Clearance between steering wheel and column cover	mm (in)	3.0 (0.12)
Steering gearbox (Power steering system)	Sliding resistance	N (kgf, lb)	314 (32, 71) or less Difference between right and left sliding resistance: Less than 20%

C: CAUTION

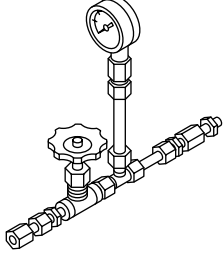

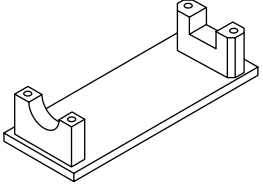

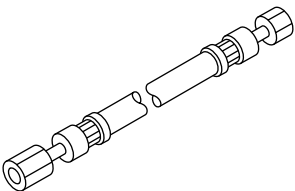

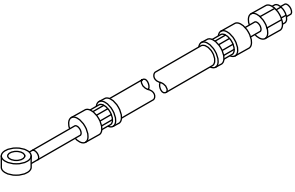

- Wear work clothing, including a cap, protective goggles and protective shoes during operation.
- Before removal, installation or disassembly, be sure to clarify the failure. Avoid unnecessary removal, installation, disassembly and replacement.
- Be careful not to burn yourself, because each part on the vehicle is hot after running.
- Use SUBARU genuine power steering fluid, grease etc. or the equivalent. Do not mix fluid, grease etc. with that of another grade or from other manufacturers.
- Be sure to tighten fasteners including bolts and nuts to the specified torque.
- Place shop jacks or rigid racks at the specified points.
- Before securing a part on a vise, place cushioning material such as wooden blocks, aluminum plate or cloth between the part and the vise.

Steering Wheel

POWER ASSISTED SYSTEM (POWER STEERING)

2. Steering Wheel

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Set the tire to the straight-ahead position.
- 3) Remove the airbag module. <Ref. to AB-16, REMOVAL, Driver's Airbag Module.>

WARNING:

Always refer to "Airbag System" before performing airbag module service. <Ref. to AB-5, CAUTION, General Description.>

- 4) Place alignment marks on the steering wheel and steering shaft.

(1) Alignment mark

- 5) Remove the steering wheel nut, and then draw out the steering wheel from shaft using steering puller.

B: INSTALLATION

WARNING:

Always refer to "Airbag System" before performing airbag module service. <Ref. to AB-5, CAUTION, General Description.>

- 1) Align the center of roll connector. <Ref. to AB-25, ADJUSTMENT, Roll Connector.>
- 2) Install in the reverse order of removal.

NOTE:

Align the alignment marks on the steering wheel and steering shaft.

Tightening torque:

45 N·m (4.6 kgf·m, 33.2 ft·lb)

Column cover-to-steering wheel clearance:

2 — 4 mm (0.08 — 0.16 in)

CAUTION:

Insert roll connector guide pin into guide hole on lower end of surface of steering wheel to prevent damage.

C: INSPECTION

- 1) Check the steering wheel for deformation. If the deformation is excessive, replace the steering wheel.

- 2) Check the splines on the steering wheel for damage. If the damage is excessive, replace the steering wheel.

Universal Joint

POWER ASSISTED SYSTEM (POWER STEERING)

3. Universal Joint

A: REMOVAL

- 1) Remove the steering wheel. <Ref. to PS-14, REMOVAL, Steering Wheel.>
- 2) Place alignment marks on universal joint.
- 3) Remove the universal joint bolts and then remove the universal joint.

B: INSTALLATION

- 1) Align the cutout at serrated section of the column shaft and yoke, then install the universal joint into column shaft.

- (1) Cutout
- (2) Yoke
- (3) Column shaft
- (4) Column shaft side
- (5) Gearbox side

- 2) Install the universal joint to the serrations of gearbox assembly by matching alignment marks.
- 3) Tighten the bolt.

Tightening torque:

24 N·m (2.4 kgf·m, 17.4 ft·lb)

CAUTION:

Excessively large tightening torque of universal joint bolts may lead to heavy steering wheel operation.

- 4) Align the center of roll connector. <Ref. to AB-25, ADJUSTMENT, Roll Connector.>
- 5) Install the steering wheel. <Ref. to PS-14, INSTALLATION, Steering Wheel.>

C: INSPECTION

Check for wear, damage or any other faults. If necessary, replace it.

Service limit:

Universal joint play: 0 mm (0 in)

Maximum swing torque: 0.3 N (0.03 kgf, 0.07 lb)

- (1) Swinging torque
- (2) Play

Measure the swing torque of universal joint.

Service limit:

Maximum load: 3.8 N (0.39 kgf, 0.86 lb) or less

- (1) Yoke (Gearbox side)

Universal Joint

POWER ASSISTED SYSTEM (POWER STEERING)

Service limit:

Maximum load: 3.8 N (0.39 kgf, 0.86 lb) or less

(1) Yoke (Gearbox side)

Service limit:

Maximum load: 7.3 N (0.74 kgf, 1.64 lb) or less

(1) Yoke (Steering column side)

Service limit:

Maximum load: 7.3 N (0.74 kgf, 1.64 lb) or less

(1) Yoke (Steering column side)

Tilt Steering Column

POWER ASSISTED SYSTEM (POWER STEERING)

4. Tilt Steering Column

A: REMOVAL

PS-00466

(1) Tilt steering column

(2) Universal joint

- 1) Remove the steering wheel. <Ref. to PS-14, REMOVAL, Steering Wheel.>
- 2) Remove the universal joint. <Ref. to PS-15, REMOVAL, Universal Joint.>
- 3) Remove the instrument panel lower cover under.
- 4) Remove the instrument panel lower cover upper.
- 5) Remove all connectors from the steering column.
- 6) Remove the two bolts under instrument panel securing steering column.

CAUTION:

- Be sure to remove the universal joint before removing steering shaft assembly installing bolts when removing steering shaft assembly or when lowering it for servicing of other parts.
- Do not loosen the tilt lever when the steering column is not secured to the vehicle.

B: INSTALLATION

- 1) Install the grommet to toe board.

PS-00444

- 7) Pull out the steering shaft assembly from the hole on toe board.

PS-00041

- 2) Insert the end of steering shaft into toe board grommet.
- 3) With the tilt lever secured, tighten the steering shaft mounting bolts under instrument panel.

Tilt Steering Column

POWER ASSISTED SYSTEM (POWER STEERING)

Tightening torque:

25 N·m (2.5 kgf·m, 18.1 ft·lb)

4) Connect all the connectors under instrument panel.

5) Connect the airbag system connector at the harness spool.

NOTE:

Make sure to apply double lock.

6) Install the instrument panel lower cover with tilt lever held in the lowered position.

7) Install the universal joint. <Ref. to PS-15, INSTALLATION, Universal Joint.>

8) Align the center of roll connector. <Ref. to AB-25, ADJUSTMENT, Roll Connector.>

9) Install the steering wheel. <Ref. to PS-14, INSTALLATION, Steering Wheel.>

CAUTION:

Insert roll connector guide pin into guide hole on lower end of steering wheel surface to prevent damage.

C: DISASSEMBLY

Remove the two screws securing upper steering column covers, and the two screws securing combination switch, and then remove the related parts.

D: ASSEMBLY

Insert the combination switch to the upper column shaft, and install the upper column cover. Then route the ignition key harness and combination switch harness between column cover mounting bosses.

Tightening torque:

1.2 N·m (0.12 kgf·m, 0.9 ft·lb)

CAUTION:

Do not overtorque the screw.

E: INSPECTION

1. BASIC INSPECTION

Measure the overall length of steering column. If not as specified, replace it.

Overall length L:

Standard value

Except for OUTBACK model

$833.6^{+1.3} \text{ mm} \text{ }_{-0.3} \text{ mm}$ ($32.82^{+0.051} \text{ in} \text{ }_{-0.020} \text{ in}$)

OUTBACK model

$825.4^{+1.3} \text{ mm} \text{ }_{-0.3} \text{ mm}$ ($32.50^{+0.051} \text{ in} \text{ }_{-0.020} \text{ in}$)

2. AIRBAG SYSTEM INSPECTION

WARNING:

For airbag inspection procedures, refer to “Airbag System”. <Ref. to AB-5, CAUTION, General Description.>

Steering Gearbox

POWER ASSISTED SYSTEM (POWER STEERING)

5. Steering Gearbox

A: REMOVAL

- 1) Set the vehicle on a lift.
- 2) Disconnect the ground cable from battery.
- 3) Loosen the front wheel nuts.
- 4) Lift-up the vehicle and remove the front wheels.
- 5) Remove the under cover. <Ref. to EI-26, REMOVAL, Front Under Cover.>
- 6) Remove the front exhaust pipe assembly. (Non-turbo model) <Ref. to EX(H4SO)-4, REMOVAL, Front Exhaust Pipe.>

WARNING:

Be careful, not to burn your hand because the exhaust pipe is hot.

- 7) Using a puller, remove the tie-rod end from the knuckle arm after pulling off cotter pin and removing castle nut.

- (1) Castle nut
- (2) Tie-rod end
- (3) Knuckle arm

- 8) Remove the front crossmember support plate, jack-up plate and front stabilizer. <Ref. to FS-15, REMOVAL, Front Stabilizer.>

- Large type

- (1) Front crossmember support plate

- Small type

- (1) Crossmember support plate
- (2) Jack-up plate

- 9) Remove the one pipe joint at the center of gearbox, and connect the vinyl hose to the pipe and the joint. Discharge the fluid by turning steering wheel fully clockwise and counterclockwise. Discharge the fluid similarly from other pipes.

- (1) Pipe A
- (2) Pipe B

- 10) Remove the universal joint. <Ref. to PS-15, REMOVAL, Universal Joint.>

Steering Gearbox

POWER ASSISTED SYSTEM (POWER STEERING)

11) Disconnect the pipe C from pressure hose first, and pipe D from return hose second.

- (1) Pipe C
- (2) Pipe D
- (3) Pressure hose
- (4) Return hose

12) Remove the clamp bolts securing gearbox to crossmember, and remove the clamp.

- (1) Clamp

13) Remove the bolts which secure gearbox bracket, and remove the bracket and gearbox.

- (1) Bracket

B: INSTALLATION

- 1) Insert the gearbox into crossmember, being careful not to damage gearbox boot.
- 2) Install the gearbox and bracket. Tighten the bolt temporarily.

- (1) Bracket

3) Tighten the gearbox to the crossmember bracket via clamp with bolt temporarily.

- (1) Clamp

4) Tighten the bolts which temporary tightening the clamp and bracket of gearbox to specified torque.

Tightening torque:
60 N·m (6.1 kgf-m, 44.1 ft-lb)

Steering Gearbox

POWER ASSISTED SYSTEM (POWER STEERING)

5) Connect the pipe D to return hose first, and the pipe C to pressure hose second.

Tightening torque:

15 N·m (1.5 kgf-m, 10.8 ft-lb)

- (1) Pipe C
- (2) Pipe D
- (3) Pressure hose
- (4) Return hose

6) Install the universal joint. <Ref. to PS-15, INSTALLATION, Universal Joint.>

7) Connect the tie-rod end and knuckle arm, and tighten with castle nut.

Castle nut tightening torque:

27 N·m (2.75 kgf-m, 19.9 ft-lb)

CAUTION:

When connecting, do not hit cap at the bottom of tie-rod end with hammer.

8) After tightening the castle nut to specified tightening torque, tighten it further within 60° until cotter pin hole is aligned with slot in the nut. Fit the cotter pin into nut, and then bend the pin to lock.

- (A) Cotter pin
- (B) Castle nut
- (C) Tie-rod end

9) Install the front stabilizer. <Ref. to FS-15, INSTALLATION, Front Stabilizer.>

10) Install the front crossmember support plate and jack-up plate.

11) Install the front exhaust pipe assembly. (Non-turbo model) <Ref. to EX(H4SO)-5, INSTALLATION, Front Exhaust Pipe.>

12) Install the under cover. <Ref. to EI-26, INSTALLATION, Front Under Cover.>

13) Install the front wheels.

14) Tighten the wheel nuts to specified torque.

Tightening torque:

90 N·m (9.1 kgf-m, 65.8 ft-lb)

15) Lower the vehicle.

16) Remove the steering wheel. <Ref. to PS-14, REMOVAL, Steering Wheel.>

17) Align the center of roll connector. <Ref. to AB-25, ADJUSTMENT, Roll Connector.>

18) Install the steering wheel. <Ref. to PS-14, INSTALLATION, Steering Wheel.>

19) Connect the battery ground cable to battery.

20) Pour fluid into the oil tank, and bleed air. <Ref. to PS-54, Power Steering Fluid.>

21) Check for fluid leaks.

22) Check the fluid level in oil tank.

23) After adjusting toe-in and steering angle, tighten the lock nut on tie-rod end.

Tightening torque:

85 N·m (8.7 kgf-m, 62.7 ft-lb)

Steering Gearbox

POWER ASSISTED SYSTEM (POWER STEERING)

NOTE:

When adjusting toe-in, hold the boot as shown to prevent it from being rotated or twisted. If twisted, straighten it.

C: DISASSEMBLY

1. RACK HOUSING ASSEMBLY

1) Disconnect the four pipes from gearbox.

NOTE:

Remove the pipes C and D, which are fixed to clamp plate, as a single unit.

2) Secure the gearbox removed from vehicle in vise using ST.

ST1 926200000 STAND

ST2 34199AG000 BOSS D

CAUTION:

Secure the gearbox in a vise using ST as shown. Do not attempt to secure it without this ST.

(1) Clamp

3) Remove the tie-rod end and lock nut from gearbox.

4) Remove the small clip from the boot using pliers, and then move the boot to tie-rod end side.

(1) Clip

5) Using a flat-tip screwdriver, remove the band from boot.

NOTE:

Replace the boot if there is damage, cracks or deterioration.

(1) Band

6) Using the ST, loosen the lock nut.
ST 926230000 SPANNER

(1) Lock nut

Steering Gearbox

POWER ASSISTED SYSTEM (POWER STEERING)

7) Tighten the adjusting screw until it no longer tightens.

(1) Adjusting screw

8) Hold the rack with a wrench [22 mm width across flats], and then remove the tie-rod using a wrench [32 mm width across flats] or adjustable wrench.

PS-00511

9) Loosen the adjusting screw, and then remove the spring and sleeve.

10) Remove the two bolts securing valve assembly.

PS-00116

11) Carefully draw out the input shaft, and then remove the valve assembly.

PS-00117

12) Using a drill, release the caulking of holder.

CAUTION:

Make a hole approx. 2 mm (0.08 in) depth using a drill bit of 3 mm (0.12 in) diameter.

PS-00516

13) Using a spanner [36 mm width across flats] or adjustable wrench, remove the holder.

PS-00512

(1) Holder

14) Remove the rack bushing and rack stopper from rack assembly.

15) Remove the oil seal from rack.

Steering Gearbox

POWER ASSISTED SYSTEM (POWER STEERING)

16) Insert the ST from pinion housing side, and then remove the oil seal using a press.

ST 34199AE050 OIL SEAL REMOVER

- (1) Press
- (2) Oil seal

17) Using a press, remove the bushing at gearbox installation portion.

2. CONTROL VALVE

1) Disconnect the pipes A and B from gearbox.

2) Secure the gearbox removed from the vehicle in vise using ST.

ST1 926200000 STAND

ST2 34199AG000 BOSS D

CAUTION:

Secure the gearbox in a vise using ST as shown. Do not attempt to secure it without this ST.

- (1) Clamp

3) Using the ST, loosen the lock nut.

ST 926230000 SPANNER

- (1) Lock nut

4) Tighten the adjusting screw until it no longer tightens.

- (1) Adjusting screw

5) Loosen the adjusting screw, and then remove the spring and sleeve.

Steering Gearbox

POWER ASSISTED SYSTEM (POWER STEERING)

6) Remove the two bolts securing valve assembly.

7) Carefully draw out the input shaft, and then remove the valve assembly.

8) Wrap the tape to spline part, and slide the dust cover out.

(1) Dust cover

9) Using a press remove the pinion & valve assembly from valve housing.

- (1) Pinion & valve ASSY
- (2) Valve housing
- (3) Cloth

10) Using the ST and press, remove the bushing and oil seal from valve housing.

ST 34199AG090 INSTALLER & REMOVER

CAUTION:

- Do not apply force to the end surface of valve housing.
- Do not reuse the oil seal after removal.

- (1) Oil seal
- (2) Bushing

Steering Gearbox

POWER ASSISTED SYSTEM (POWER STEERING)

11) Using a snap ring pliers, remove the snap ring, valve, oil seal and backup washer.

CAUTION:

Be careful not to scratch the pinion & valve assembly.

- (1) Snap ring
- (2) Valve
- (3) Oil seal
- (4) Backup ring

PS-00559

- (1) Seal ring
- (2) Rack

(2) Using ST-B and ST-C, install the oil seal to ST-A.

ST 927490000 INSTALLER A, B, C

NOTE:

Face the oil seal in the direction as shown in the figure.

PS-00075

- (A) Oil seal

(3) Insert the ST-A with oil seal assembled from the gear side of rack. Remove the oil seal from ST-A near piston, and then remove the ST-A from rack.

PS-00076

- (A) Oil seal
- (B) Rack
- (C) Piston

Steering Gearbox

POWER ASSISTED SYSTEM (POWER STEERING)

4) Install the backup washer from gear side of rack.

- (1) Oil seal
- (2) Backup washer
- (3) Rack

5) Install the ST on rack, and equally apply a thin coat of grease to the rack and ST, then install the oil seal.

ST 926250000 GUIDE

CAUTION:

Be careful not to scratch the oil seal lips with the inner ring section of piston.

- (1) Rack piston inner ring
- (2) Outer side oil seal
- (3) Rack

6) Apply a coat of grease to the grooves in rack, sliding surface of sleeve and sealing surface of piston. Then insert the rack into steering body from cylinder side.

7) Check the thread part of holder and end of gearbox cylinder for burrs and scratches. Correct if necessary.

8) Insert the ST into gearbox cylinder, and then press-fit the oil seal.

ST 34199AG010 INSTALLER

9) Temporarily install the holder to gearbox cylinder.

10) Set the ST to the end of rack.

ST 34099FA030 INSTALLER & REMOVER

11) Using a press, press-fit until the groove of ST reaches the end of holder.

- (1) Groove
- (2) Holder

12) Secure the gearbox in a vice using ST.

ST2 34199AG000 BOSS D

- (1) Clamp

13) Tighten the holder.

Steering Gearbox

POWER ASSISTED SYSTEM (POWER STEERING)

Tightening torque:

70 N·m (7.1 kgf-m, 51.6 ft-lb)

(1) Holder

14) Using ST, caulk the gearbox cylinder at 2 mm (0.08 in) from end to make punch hole 2 to 2.5 mm (0.08 to 0.10 in) in diameter.

ST 34099FA060 PUNCH HOLDER

- (1) 2 mm (0.08 in)
- (2) Diameter: 2 — 2.5 mm (0.08 — 0.10 in)
- (3) End of cylinder
- (4) Holder

15) Apply vinyl tape to spline portion, and apply genuine grease to dust cover, and then install the dust cover to valve assembly.

CAUTION:

Be sure to install the dust cover to groove on shaft properly.

- (1) Dust cover
- (2) Groove

16) Apply genuine grease to the pinion gear and bearing of valve assembly.

17) Install a new gasket on valve assembly. Insert the valve assembly into place while facing the rack teeth toward pinion.

18) Tighten the bolts alternately to secure valve assembly.

Tightening torque:

20 N·m (2.0 kgf-m, 14.8 ft-lb)

CAUTION:

Be sure to alternately tighten the bolts.

19) Temporarily install the rack, and then operate it from lock to lock two or three times to make it fit in. Remove the grease blocking air vent hole.

CAUTION:

If operating the rack from lock to lock without installing tie-rod, it may damage the oil seal. Always install the tie-rods LH and RH.

20) Apply liquid gasket to at least 1/3 of the entire perimeter of adjusting screw thread.

Liquid gasket:

THREE BOND 1141

21) Apply a coat of grease to the sliding surface of sleeve and seating surface of spring, and then insert sleeve into steering body.

Steering Gearbox

POWER ASSISTED SYSTEM (POWER STEERING)

Charge the adjusting screw with grease, and then insert the spring into adjusting screw and install on steering body.

- (1) Sleeve
- (2) Spring
- (3) Adjusting screw

22) Tighten the adjusting screw to specified torque, then loosen it.

Tightening torque:

25 N·m (2.5 kgf-m, 18.1 ft-lb)

23) After tightening the adjusting screw with the specified tightening torque, loosen it by 20°.

Tightening torque:

3.9 N·m (0.4 kgf-m, 2.9 ft-lb)

24) Remove the tie-rod.

25) Adjust the turning resistance of gearbox so that it is within specification using adjusting screw. <Ref. to PS-37, TURNING RESISTANCE OF GEARBOX, INSPECTION, Steering Gearbox.>

26) Apply liquid gasket to lock nut and install it into adjusting screw. While holding the adjusting screw with a wrench, tighten lock nut using ST.

Liquid gasket:

THREE BOND 1141

ST 926230000 SPANNER

Tightening torque (Lock nut):

25 N·m (2.5 kgf-m, 18.1 ft-lb)

NOTE:

Hold the adjusting screw with a wrench to prevent it from turning while tightening lock nut.

27) Extend the rack approx. 40 mm (1.57 in) beyond side of steering body.

28) Install the tie-rod and a new lock washer into rack.

Tightening torque:

90 N·m (9.1 kgf-m, 65.8 ft-lb)

- (1) Lock washer
- (2) Approx. 40 mm (1.57 in)

29) Bend the lock washer.

CAUTION:

Be careful not to scratch the rack when bending lock washer.

- (1) Lock washer

30) Apply a coat of grease to the tie-rod groove, and then install the boot to housing.

Steering Gearbox

POWER ASSISTED SYSTEM (POWER STEERING)

CAUTION:

Right side boot has groove for identification.
Be sure to install the boots after identifying left and right boots.

- (1) Right side boot
- (2) Groove for identification

NOTE:

Make sure that the boot is installed without unusual inflation or deflation.

31) Install a new boot band. Using band clamp pliers, caulk the boot band until caulking part clearance is 2 mm (0.079 in) or less.

- (A) Boot band
- (B) 2 mm (0.079 in) or less

32) Fix the boot end with clip (small).

- (1) Clip

33) After installing, check the boot end is positioned into groove on tie-rod.

34) If the tie-rod end has been removed, screw in the lock nut and tie-rod end to screwed portion of tie-rod, and then tighten the lock nut temporarily in a position as shown in the figure.

Steering Gearbox

POWER ASSISTED SYSTEM (POWER STEERING)

Installed tie-rod length L:
31 mm (1.22 in)

35) Inspect the gearbox as follows:
"A" Holding the tie-rod end, repeat lock to lock two or three times as quickly as possible.
"B" Holding the tie-rod end, turn it slowly at a radius one or two times as large as possible.
After all, make sure that the boot is installed in specified position without deflation.

36) Remove the gearbox from ST.
ST1 926200000 STAND
ST2 34199AG000 BOSS D

37) Install the four pipes on gearbox.
(1) Connect the pipe A and B to four pipe joints of gearbox.

Tightening torque:

Refer to COMPONENT. <Ref. to PS-4, POWER ASSISTED SYSTEM, COMPONENT, General Description.>

(2) Connect the pipe C and D to gearbox.

Tightening torque:

Pipe C: 37 N·m (3.8 kgf-m, 27.3 ft-lb)

Pipe D: 29 N·m (3.0 kgf-m, 21.4 ft-lb)

(1) Pipe C

(2) Pipe D

2. CONTROL VALVE ASSEMBLY

Specified steering grease:

VALIANT GREASE M2 (Part No. 003608001)

- 1) Clean all parts and tools before reassembling.
- 2) Apply a coat of specified power steering fluid to the inner wall of valve housing.

(1) Apply fluid.

- 3) To avoid scratching the oil seal, apply a coat of grease to the contact surface of installer and oil seal.
- 4) Verify the oil seal direction.
Attach the oil seal to installer and position in valve housing before pressing into place.
- 5) Press the oil seal into place using a press.

Steering Gearbox

POWER ASSISTED SYSTEM (POWER STEERING)

ST 34199AG090 INSTALLER & REMOVER

6) Attach the bearing to ST, and then position in value housing. Using the ST and press, install the special bearing in valve housing.

ST 34199AG090 INSTALLER & REMOVER

- (1) Special bearing
- (2) Oil seal

7) Apply vinyl tape to the groove portion of pinion.

8) Install the backup ring and oil seal to pinion, and then remove the vinyl tape.

- (1) Oil seal
- (2) Vinyl tape
- (3) Backup ring

9) Set the ST to pinion, and install the seal ring.

ST2 34199AG000 BOSS D

28) Install the four pipes on gearbox.

(1) Connect the pipe A and B to the gearbox.

Tightening torque:

Refer to COMPONENT. <Ref. to PS-4, POWER ASSISTED SYSTEM, COMPONENT, General Description.>

(2) Connect the pipe C and D to gearbox.

Tightening torque:

Pipe C: 37 N·m (3.8 kgf-m, 27.3 ft-lb)

Pipe D: 29 N·m (3.0 kgf-m, 21.4 ft-lb)

- (1) Pipe C
- (2) Pipe D

Steering Gearbox

POWER ASSISTED SYSTEM (POWER STEERING)

E: INSPECTION

1. BASIC INSPECTION

1) Clean all disassembled parts, and check for wear, damage or any other faults, then repair or replace as necessary.

2) When disassembling, check the inside of gearbox for water. If any water is found, carefully check the boot for damage, input shaft dust seal, adjusting screw and boot clips for poor sealing. If faulty, replace with new parts.

No.	Parts	Inspection	Corrective action
1	Input shaft	(1) Bend of input shaft (2) Damage on serration	If the bend or damage is excessive, replace the entire gearbox.
2	Dust seal	(1) Crack or damage (2) Wear	If the outer wall slips, the lip is worn out or damage is found, replace it with a new one.
3	Rack & pinion	Poor mating of rack with pinion	(1) Adjust the backlash properly. By measuring the turning torque of gearbox and sliding resistance of rack, check if rack & pinion engage uniformly and smoothly with each other. (Refer to "Service limit".) (2) Keeping the rack pulled out all the way so that all teeth emerge, check teeth for damage. Even if abnormality is found in either (1) or (2), replace the entire gearbox.
4	Gearbox unit	(1) Bend of rack shaft (2) Bend of cylinder portion (3) Crack or damage on cast iron portion	Replace the gearbox with a new one.
		(4) Wear or damage on rack bush	If the free play of rack shaft in radial direction is out of the specified range, replace the gearbox with a new one. (Refer to "Service limit".)
		(5) Wear on input shaft bearing	If the free plays of input shaft in radial and axial directions are out of the specified ranges, replace the gearbox with a new one. (Refer to "Service limit".)
5	Boot	Crack, damage or deterioration	Replace.
6	Tie-rod	(1) Looseness of ball joint (2) Bend of tie-rod	Replace.
7	Tie-rod end	Damage or deterioration on dust seal	Replace.
8	Adjusting screw spring	Deterioration	Replace.
9	Boot clip	Deterioration	Replace.
10	Sleeve	Damage	Replace.
11	Pipes	(1) Damage to flared surface (2) Damage to flare nut (3) Damage to pipe	Replace.

Steering Gearbox

POWER ASSISTED SYSTEM (POWER STEERING)

2. SERVICE LIMIT

Make a measurement as follows. If it exceeds the specified service limit, adjust or replace.

NOTE:

When making a measurement, vise the gearbox using ST. Never vise the gearbox by inserting aluminum plates, etc. between vise and gearbox.

ST1 926200000 STAND

ST2 34199AG000 BOSS D

Sliding resistance of rack shaft:

Service limit

400 N (41 kgf, 90 lb) or less

3. RACK SHAFT PLAY IN RADIAL DIRECTION

Right-turn steering:

Service limit

0.19 mm (0.0075 in) or less

On condition

L: 5 mm (0.20 in)

P: 122.6 N (12.5 kgf, 27.6 lb)

Left-turn steering:

Service limit

Direction ← →

0.6 mm (0.024 in) or less

Direction ← →

0.4 mm (0.016 in) or less

4. INPUT SHAFT PLAY

In radial direction:

Service limit

0.18 mm (0.0071 in) or less

On condition

P: 98 N (10 kgf, 22 lb)

In axial direction:

Service limit

0.27 mm (0.0106 in) or less

Steering Gearbox

POWER ASSISTED SYSTEM (POWER STEERING)

On condition

P: 20 — 49 N (2 — 5 kgf, 4 — 11 lb)

5. TURNING RESISTANCE OF GEARBOX

Using the ST, measure the gearbox turning resistance.

ST 34099PA100 SPANNER

Service limit:

Maximum allowable resistance:

10.5 N (1.1 kgf, 2.4 lb) or less

Difference between right and left turning resistance:

20% or less

6. OIL LEAKING

(1) Power cylinder

(3) Rack piston

(5) Input shaft

(2) Cylinder

(4) Rack axle

(6) Valve housing

1) Lift up the vehicle.

2) Even if the location of leak can be easily found by observing the leaking condition, it is necessary to thoroughly remove the fluid from the suspected portion and turn the steering wheel from lock to lock about thirty to forty times with engine running, then make comparison of the suspected portion between immediately after and several hours after this operation.

3) Cause and measure for oil leakage from "a"

The oil seal is damaged. Replace the valve assembly with a new one.

4) Cause and measure for oil leakage from "b"
The torsion bar O-ring is damaged. Replace the valve assembly with a new one.

5) Cause and measure for oil leakage from "c"
The oil seal is damaged. Replace the valve assembly or oil seal with a new one.

6) Cause and measure for oil leakage from "d"

Steering Gearbox

POWER ASSISTED SYSTEM (POWER STEERING)

The pipe is damaged. Replace the faulty pipe or O-ring.

7) Cause and measure for oil leakage from "g"

The hose is damaged. Replace the hose with a new one.

8) If leak is other than a, b, c, d, or g, and if oil is leaking from the gearbox, move the right and left boots toward tie-rod end side, respectively, with the gearbox mounted to the vehicle, and remove fluid from the surrounding portions. Then, turn the steering wheel from lock to lock about thirty to forty times with the engine running, and make comparison of the leaked portion immediately after and several hours after this operation.

(1) Leakage from "e"

The cylinder seal is damaged. Replace the rack bush with a new one.

(2) Leakage from "f"

There are two possible causes. Take the following step first. Remove the pipe assembly B from the valve housing, and close the circuit with ST.

ST 926420000 PLUG

Turn the steering wheel from lock to lock about thirty to forty times with the engine running, then make comparison of the leaked portion between immediately after and several hours after this operation.

- If leakage from "f" is noted again:

The oil seal of pinion & valve assembly is damaged. Replace the pinion & valve assembly with a new one. Or replace the oil seal and parts that are damaged during disassembly with new ones.

- If oil stops leaking from "f":

The oil seal of rack housing is damaged. Replace the oil seal and the parts that are damaged during disassembly with new ones.

F: ADJUSTMENT

1) Adjust the front toe. <Ref. to FS-11, FRONT WHEEL TOE-IN, INSPECTION, Wheel Alignment.>

Standard of front toe:

IN 3 — OUT 3 mm (IN 0.12 — OUT 0.12 in)

(1) Lock nut

2) Adjust the steering angle of wheels.

Standard of steering angle:

Model	Except for OUTBACK	OUTBACK
Inner wheel	$37.2^{\circ} \pm 1.5^{\circ}$	$38.0^{\circ} \pm 1.5^{\circ}$
Outer wheel	$33.0^{\circ} \pm 1.5^{\circ}$	$33.7^{\circ} \pm 1.5^{\circ}$

3) If the steering wheel spokes are not horizontal when wheels are set in the straight ahead position, and error is more than 5° on the periphery of steering wheel, correctly re-install the steering wheel.

(1) Within 5°

4) If the steering wheel spokes are not horizontal with vehicle set in the straight ahead position after this adjustment, correct it by turning the right and left tie-rods in opposite direction by same angle.

Pipe Assembly

POWER ASSISTED SYSTEM (POWER STEERING)

6. Pipe Assembly

A: REMOVAL

- 1) Disconnect the ground cable from battery.
 - 2) Lift-up the vehicle, and then remove the front crossmember support plate and jack-up plate.
- Large type

(1) Front crossmember support plate

- Small type

(1) Front crossmember support plate
(2) Jack-up plate

- 3) Remove one pipe joint at the center of gearbox, and connect the vinyl hose to the pipe and the joint. Discharge the fluid by turning steering wheel fully clockwise and counterclockwise. Discharge the fluid similarly from other pipes.

(1) Pipe A
(2) Pipe B

- 4) Remove the clamp E from return hose and pressure hose.

(1) Return hose
(2) Pressure hose
(3) Clamp E

- 5) Disconnect the return hose and pipe D, pressure hose and pipe C.

(1) Pipe C
(2) Pipe D
(3) Pressure hose
(4) Return hose

- 6) Remove the air intake duct. <Ref. to IN(H4DOTC)-9, REMOVAL, Air Intake Duct.>
<Ref. to IN(H4SO)-10, REMOVAL, Air Intake Duct.>

Pipe Assembly

POWER ASSISTED SYSTEM (POWER STEERING)

7) Disconnect the suction hose and pressure hose from oil pump.

• H6 model

- (1) Suction hose
- (2) Pressure hose

8) Disconnect the suction hose and return hose from reservoir tank. Remove the oil cooler from oil cooler bracket.

• H4 model

- (5) Oil cooler

Pipe Assembly

POWER ASSISTED SYSTEM (POWER STEERING)

4) Connect the suction hose and pressure hose to the oil pump. Tighten the eye bolt of pressure hose.

Tightening torque:

39 N·m (3.98 kgf-m, 28.8 ft-lb)

- (1) Suction hose
- (2) Pressure hose

5) Temporarily connect the pressure hose and pipe C, the return hose and D. Place the clamp E in the position shown in the figure, and tighten the bolt temporarily.

- (1) Return hose
- (2) Pressure hose
- (3) Approx. 18 mm (0.71 in)
- (4) Clamp E
- (5) Pipe C
- (6) Pipe D

6) Tighten the clamp E.

Tightening torque:

7.4 N·m (0.75 kgf-m, 5.4 ft-lb)

7) Tighten the pressure hose and pipe C, the return hose and pipe D.

Tightening torque:

15 N·m (1.5 kgf-m, 10.8 ft-lb)

8) Connect the pipe A and B to the four pipe joints of gearbox.

Tightening torque:

Refer to COMPONENT in General Description. <Ref. to PS-4, POWER ASSISTED SYSTEM, COMPONENT, General Description.>

- (1) Pipe A
- (2) Pipe B

9) Install the front crossmember support plate and jack-up plate.

10) Lower the vehicle.

11) Tighten the bolts which hold the hose bracket.

Tightening torque:

10 N·m (1.02 kgf-m, 7.4 ft-lb)

- (1) Hose ASSY
- (2) Hose bracket

12) Install the air intake duct. <Ref. to IN(H4DOTC)-9, INSTALLATION, Air Intake Duct.> <Ref. to IN(H4SO)-10, INSTALLATION, Air Intake Duct.>

13) Connect the battery ground cable to battery.

14) Feed the specified fluid.

CAUTION:

Never start the engine before feeding the fluid; otherwise vane pump might be seized up.

Pipe Assembly

POWER ASSISTED SYSTEM (POWER STEERING)

15) Finally, check clearance between pipes or hoses as shown in the figure indicated in "General Diagnostic Table". <Ref. to PS-59, INSPECTION OF CLEARANCE, INSPECTION, General Diagnostic Table.>

C: INSPECTION

Check all disassembled parts for wear, damage or other abnormalities. Repair or replace defective parts as necessary.

Parts	Maintenance Parts	Corrective action
Pipe	<ul style="list-style-type: none"> • O-ring fitting surface for damage • Nut for damage • Pipe for damage 	Replace with a new one.
Clamp	<ul style="list-style-type: none"> • Clamps for weak clamping force 	Replace with a new one.
Hose	<ul style="list-style-type: none"> • Flare surface for damage • Flare nut for damage • Outer surface for cracks • Outer surface for wear • Clip for damage • End coupling or adapter for deformation 	Replace with a new one.

CAUTION:

Although surface layer materials of rubber hoses have excellent weathering resistance, heat resistance and resistance for low temperature brittleness, they are likely to be damaged chemically by brake fluid, battery electrolyte, engine oil and automatic transmission fluid and their service lives are to be very shortened. Wipe out immediately when the hoses are adhered with the fluids.

Since resistances for heat or low temperature brittleness are gradually declining according to time accumulation of hot or cold conditions for the hoses and their service lives are shortening accordingly, it is necessary to perform careful inspection frequently when the vehicle is used in hot weather areas, cold weather areas and a driving condition in which many steering operations are required in short time.

Particularly continuous work of relief valve over 5 seconds causes to reduce service lives of the hoses, the oil pump, the fluid, etc. due to over heat.

Trouble	Possible cause	Corrective action
Pressure hose burst	Excessive holding time of relief status	Instruct customers.
	Malfunction of relief valve	Replace oil pump.
	Poor cold characteristic of fluid	Replace fluid.
Forced out return hose	Poor connection	Repair.
	Poor holding of clip	Retighten.
	Poor cold characteristic of fluid	Replace fluid.
Fluid bleeding out of hose slightly	Wrong layout, tensioned	Replace hose.
	Excessive play of engine due to deterioration of engine mounting rubber	Replace the parts if defective.
	Improper stop position of pitching stopper	Replace the parts if defective.
Crack on hose	Excessive holding time of relief status	Replace. Instruct customers.
	Excessive tightening torque of return hose clip	Replace.
	Power steering fluid, engine oil, electrolyte adhere on the hose surface	Replace. Pay attention on service work.
	Too many times use in extremely cold weather	Replace. Instruct customers.

Pipe Assembly

POWER ASSISTED SYSTEM (POWER STEERING)

NOTE:

It is likely that although one judges fluid leakage, there is actually no leakage. This is because the fluid spilt during the last maintenance was not completely wiped off. Be sure to wipe off spilt fluid thoroughly after maintenance.

PS-00541

(A) H6 model

(B) H4 model

Fluid leaking area	Possible cause	Corrective action
Leakage from connecting portions of pipes and hoses, numbered with (1) through (8) in figure	Insufficient tightening of flare nut, adhesion of dirt, damage to flare or flare nut or eye bolt	Loosen and retighten. Replace if ineffective.
	Poor insertion of hose or clamping	Retighten or replace the clamp.
	Damaged O-ring or gasket	Replace O-ring or gasket pipe or hose with new one, if ineffective, replace the gearbox also.
Leakage from hose (9) through (13) in figure	Crack or damage in hose	Replace with a new one.
	Crack or damage in hose hardware	Replace with a new one.
Leakage from surrounding of cast iron portion of oil pump (14) and (15) in figure	Damaged O-ring	Replace the oil pump.
	Damaged gasket	Replace the oil pump.
Leakage from oil tank (16) and (17) in figure	Crack in oil tank	Replace the oil tank.
Leakage from filler neck (18)	Damaged cap packing	Replace the cap.
	Crack in root of filler neck	Replace the oil tank.
	High fluid level	Adjust the fluid level.
Leakage from surrounding of power cylinder of gearbox (19) in figure	Damaged oil seal	Replace the oil seal.
Leakage from control valve of gearbox (20) and (21) in figure	Damaged packing or oil seal	Replace the problem parts.
	Damage in control valve	Replace the control valve.
(22) Leakage from connecting portion of cooler pipe and hose.	Insufficient tightening of connecting portion.	Loosen and retighten.

7. Oil Pump

A: REMOVAL

1. H4 MODEL

- 1) Disconnect the ground cable from battery.
- 2) Remove the air intake duct. <Ref. to IN(H4DOTC)-9, REMOVAL, Air Intake Duct.> <Ref. to IN(H4SO)-10, REMOVAL, Air Intake Duct.>
- 3) Remove the pulley belt cover.
- 4) Loosen the belt tension securing bolt and generator securing bolt, and then remove the power steering pump V-belt.

PS-00461

- 5) Disconnect the connector from power steering pump switch.
- 6) Disconnect the pressure hose and suction hose from oil pump.

CAUTION:

- Do not allow fluid to come into contact with pulley belt.
 - To prevent foreign matter from entering the hose and pipe, cover the open ends with a clean cloth.
- Non-turbo model

PS-00688

- (1) Suction hose
- (2) Pressure hose

- 10) Disassemble the oil pump and bracket by inserting a flat tip screwdriver as shown in the figure.

- Turbo model

PS-00459

- (1) Suction hose
- (2) Pressure hose

- 7) Remove the bolts which hold the power steering pump bracket.

PS-00188

- 8) Place the oil pump bracket in a vise, and remove the two bolts from the front side of oil pump.

CAUTION:

- When securing the oil pump bracket in a vise, hold the oil pump bracket with the least possible force between two wood pieces.

PS-00128

- 9) Remove the bolt from the rear side of oil pump.

Oil Pump

POWER ASSISTED SYSTEM (POWER STEERING)

2. H6 MODEL

- 1) Disconnect the ground cable from battery.
- 2) Remove the cover of pulley belt.
- 3) Remove the V-belt.
- 4) Remove the power steering pressure switch connector.
- 5) Remove the tensioner adjuster.
- 6) Disconnect the pressure hose and suction hose from the oil pump.

CAUTION:

- Do not allow fluid to flow from the hose end and to contact pulley belt.
- To prevent entering foreign matter into hose, cover the hose opening with clean cloth.

- (1) Suction hose
- (2) Pressure hose

- 7) Remove the bolts which install power steering pump bracket.

- 8) Place the oil pump bracket in a vise, and remove the two bolts from the front side of oil pump.

CAUTION:

When securing the oil pump bracket in a vise, hold the oil pump bracket with the least possible force between two wood pieces.

- 9) Remove the bolt from back side of oil pump.

- 10) Remove the oil pump from bracket.

B: INSTALLATION

1. H4 MODEL

- 1) Install the oil pump to bracket.
 - (1) Place the oil pump bracket in a vise. Tighten the bushing using a 12.7 mm (1/2") type 14- and 21-mm box wrench until it is in contact with oil pump mounting surface.

Oil Pump

POWER ASSISTED SYSTEM (POWER STEERING)

CAUTION:

When securing the oil pump bracket in a vise, hold the oil pump bracket with the least possible force between two wood pieces.

- (1) Bushing
- (2) Nut
- (3) 21 mm
- (4) 14 mm
- (5) Bolt

(2) Tighten the bolt which holds the oil pump to bracket.

Tightening torque:

15.7 N·m (1.6 kgf-m, 11.6 ft-lb)

Tightening torque:

37.3 N·m (3.8 kgf-m, 27.5 ft-lb)

2) Tighten the bolts which hold the power steering pump bracket.

Tightening torque:

<Ref. to PS-7, OIL PUMP, COMPONENT, General Description.>

3) Interconnect the pressure hose and suction hose.

Tightening torque:

Eye bolt

39 N·m (4.0 kgf-m, 28.9 ft-lb)

CAUTION:

If a hose is twisted at this step, take care the hose may come into contact with some other parts.

- Non-turbo model

- (1) Suction hose
- (2) Pressure hose

- Turbo model

- (1) Suction hose
- (2) Pressure hose

Oil Pump

POWER ASSISTED SYSTEM (POWER STEERING)

- 4) Connect the connector to power steering pump switch.
- 5) Install the V-belts to oil pump.
- 6) Check the tension of V-belt.
<Ref. to ME(H4SO)-38, INSPECTION, V-belt.>
- 7) Tighten the belt tension bolt.

Tightening torque:

25 N·m (2.5 kgf-m, 18.4 ft-lb)

- 8) Install the pulley belt cover.
- 9) Install the air intake duct.
<Ref. to IN(H4DOTC)-9, INSTALLATION, Air Intake Duct.> <Ref. to IN(H4SO)-10, INSTALLATION, Air Intake Duct.>
- 10) Connect the ground cable to battery.
- 11) Feed the specified power steering fluid. <Ref. to PS-54, Power Steering Fluid.>

CAUTION:

Never start the engine before feeding the fluid otherwise vane pump might be seized up.

2. H6 MODEL

- 1) Install the oil pump to bracket.
 - (1) Place the oil pump bracket in a vise. Tighten the bushing using a 12.7 mm (1/2") type 14- and 21-mm box wrench until it is in contact with oil pump mounting surface.

CAUTION:

When securing the oil pump bracket in a vise, hold the oil pump bracket with the least possible force between two wood pieces.

- (1) Bushing
- (2) Nut
- (3) 21 mm
- (4) 14 mm
- (5) Bolt

- (2) Tighten the bolt which installs oil pump to bracket.

Tightening torque:

15.7 N·m (1.6 kgf-m, 11.6 ft-lb)

Tightening torque:

37.3 N·m (3.8 kgf-m, 27.5 ft-lb)

- 2) Tighten the bolts which install power steering pump bracket.

Tightening torque:

<Ref. to PS-7, OIL PUMP, COMPONENT, General Description.>

- 3) Connect the pressure hose and suction hose each other.

Tightening torque:

Eye bolt

39 N·m (4.0 kgf-m, 28.9 ft-lb)

Oil Pump

POWER ASSISTED SYSTEM (POWER STEERING)

CAUTION:

If a hose is twisted at this step, take care the hose may come into contact with some other parts.

- (1) Suction hose
- (2) Pressure hose

- 4) Connect the connector to power steering oil pressure switch.
- 5) Install the tensioner adjuster.
- 6) Install the V-belts.
- 7) Install the cover of pully belt.
- 8) Connect the battery ground cable to battery.
- 9) Pour the specified power steering fluid. <Ref. to PS-54, Power Steering Fluid.>

CAUTION:

Never start the engine before feeding the fluid; otherwise vane pump might be seized up.

Oil Pump

POWER ASSISTED SYSTEM (POWER STEERING)

C: INSPECTION

1. BASIC INSPECTION

Perform the following inspection procedures and replace defective parts.

No.	Parts	INSPECTION	Corrective action
1	Oil pump (Exterior)	(1) Crack, damage or oil leakage	Replace the oil pump with a new one.
		(2) Play of pulley shaft	Measure the radial play and axial play. If any of these exceeds the service limit, replace the oil pump with a new one.
2	Pulley	(1) Damage	Replace with a new one.
		(2) Bend	Measure the V ditch deflection. If it exceeds the service limit, replace the pulley with a new one.
3	Oil pump (Interior)	(1) Defect or burning of vane pump	Check the resistance to the rotation of pulley. If it exceeds the service limit, replace the oil pump with a new one.
		(2) Bend in the shaft or damage to bearing	Oil pump emits a noise that is markedly different in tone and loudness from a sound of a new oil pump when turning its pulley which is put around with a string, replace the oil pump with a new one.
4	O-ring	Crack or deterioration	Replace with a new one.
5	Bracket	Crack	Replace with a new one.

2. SERVICE LIMIT

Make a measurement as follows. If it exceeds the service limit, replace with a new one.

CAUTION:

- When securing the oil pump on a vice, hold the oil pump with the least possible force between two wood pieces.
- Do not set outside of flow control valve or pulley on a vice; otherwise outside or pulley might be deformed. Select properly sized wood pieces.

1) Play of the pulley shaft

Condition:

P: When applying the force of 9.8 N (1.0 kgf, 2.2 lb)

Service limit:

Radial play (Direction ← →)
0.4 mm (0.016 in) or less

(1) Dial gauge

Axial play (Direction ⇐ ⇐ ⇐)
0.9 mm (0.035 in) or less

(1) Dial gauge

2) Ditch deflection of pulley

Oil Pump

POWER ASSISTED SYSTEM (POWER STEERING)

Service limit:

1.0 mm (0.039 in) or less

NOTE:

Read the value for one surface of V ditch, and then the value for another off the dial.

(1) Dial gauge

3) Resistance to rotation of pulley

Service limit:

Maximum load: 9.22 N (0.94 kgf, 2.07 lb) or less

NOTE:

- A rather higher value may be indicated when pulley starts turning.
- Measure the load during rotation to make a judgment.

(1) Spring balance

3. HYDRAULIC PRESSURE

NOTE:

- Be sure to complete all items aforementioned in "INSPECTION", prior to measuring hydraulic pressure. Otherwise, pressure cannot be measured correctly. <Ref. to PS-55, INSPECTION, General Diagnostic Table.>

- Do not leave the valve of pressure gauge closed or hold the steering wheel at stop end for 5 seconds or more in any case, as the oil pump may be damaged due to long keep of these conditions.

ST3 34099AC010 ADAPTER HOSE A

- Put cloth at a place where fluid drops before pressure gauge is installed. Wipe off spilt fluid thoroughly after the measurement.

1) Regular pressure measurement

- (1) Connect ST1, ST2 and ST3.

ST1 925711000 PRESSURE GAUGE

ST2 34099AC020 ADAPTER HOSE B

ST3 34099AC010 ADAPTER HOSE A

- (2) Remove the air intake duct.

- (3) Disconnect the pipe C from pump.

- (4) Using the gasket (Part No. 34621AC021) and bolt (Part No. 34620AC010), install the ST2 to pump instead of pressure hose.

- Non-turbo model

(1) Suction hose

(2) Pressure hose

- Turbo model

(1) Suction hose

(2) Pressure hose

- (5) Install the ST3 to the end of pressure hose which is removed from pump.

- (6) Replenish the power steering fluid up to specified level.

- (7) Open the valve, and start the engine.

- (8) Measure the regular pressure.

ST1 925711000 PRESSURE GAUGE

ST2 34099AC020 ADAPTER HOSE B

Oil Pump

POWER ASSISTED SYSTEM (POWER STEERING)

(1) Valve

Service limit:

981 kPa (10 kg/cm², 142 psi) or less

(9) If it is not within the specified value, replace the troubled part caused by following symptoms. (Pipe or hose clogged, leaks from fluid line, and mixture of foreign matters in fluid line)

2) Measure the relief pressure.

- (1) Using the STs, measure the relief pressure.
- (2) Close the valve.
- (3) Measure the relief pressure.

ST1 925711000 PRESSURE GAUGE
ST2 34099AC020 ADAPTER HOSE B
ST3 34099AC010 ADAPTER HOSE A

ST1 925711000 PRESSURE GAUGE
ST2 34099AC020 ADAPTER HOSE B
ST3 34099AC010 ADAPTER HOSE A

(1) Valve

Service limit:

7,650 — 8,330 kPa (78 — 85 kg/cm², 1,110 — 1,208 psi)

(4) If it is not within the specified value, measure the steering effort. <Ref. to PS-58, MEASUREMENT OF STEERING EFFORT, INSPECTION, General Diagnostic Table.> If it is not within specified value, replace the control valve itself or control valve and pinion as a single unit with new ones.

(1) Valve

Service limit:

H4 model:

7,350 — 8,036 kPa (75 — 82 kg/cm², 1,067 — 1,165 psi)

H6 model:

8,300 — 9,000 kPa (85 — 92 kg/cm², 1,204 — 1,305 psi)

(4) If it is not within the specified value, replace the oil pump.

3) Measure working pressure.

- (1) Using the STs, measure the working pressure.
- (2) Open the valve.
- (3) Measure the working pressure of control valve by turning steering wheel from stop to stop.

Reservoir Tank

POWER ASSISTED SYSTEM (POWER STEERING)

8. Reservoir Tank

A: REMOVAL

- 1) Drain fluid from the reservoir tank.
- 2) Disconnect the hose from reservoir tank.

CAUTION:

To prevent foreign matter from entering the hose and pipe, cover the open ends of them with a clean cloth.

- H4 model

- (1) Reservoir tank
- (2) Suction hose
- (3) Return hose
- (4) Oil cooler
- (5) Oil cooler bracket

- H6 model

- (1) Reservoir tank
- (2) Suction hose
- (3) Return hose

- 3) Remove the reservoir tank from body.

B: INSTALLATION

- 1) Install the reservoir tank to body.

Tightening torque:

13 N·m (1.32 kgf·m, 9.6 ft·lb)

- 2) Connect the hose to reservoir tank.

- H4 model

- (1) Reservoir tank
- (2) Suction hose
- (3) Return hose
- (4) Oil cooler
- (5) Oil cooler bracket

- H6 model

- (1) Reservoir tank
- (2) Suction hose
- (3) Return hose

- 3) Feed the power steering fluid to specified level.
<Ref. to PS-54, Power Steering Fluid.>

C: INSPECTION

Check the reservoir tank for cracks, breakage and damage. If a failure is found, replace the reservoir tank.

Power Steering Fluid

POWER ASSISTED SYSTEM (POWER STEERING)

9. Power Steering Fluid

A: SPECIFICATION

Recommended power steering fluid	Manufacturer
ATF DEXRON III or equivalent	B.P.
	CALTEX
	CASTROL
	MOBIL
	SHELL
	TEXACO

B: INSPECTION

1) Check the power steering fluid for deterioration and contamination. If the fluid is highly deteriorated or contaminated, drain it and refill with new fluid.

2) Check the joints and units for oil leakage. If any oil leaks are found, repair or replace the applicable part.

3) Inspect the fluid level on flat and level surface with engine "OFF" by indicator of reservoir tank.

If the level is at "MIN." point or below, add fluid to keep the level in the specified range of the indicator. If at "MAX." point or above, drain fluid by using a syringe or the like.

(1) Check at power steering fluid temperature 20°C (68°F); read the fluid level on the "COLD" side.

(2) Check at power steering fluid temperature 80°C (176°F); read the fluid level on the "HOT" side.

C: REPLACEMENT

1) Lift-up the vehicle.

2) Remove the crossmember support.

3) Remove the pipe joint in the center of gearbox, and connect the vinyl hose to the pipe and joint. Wipe fluid off while turning the steering wheel.

4) Add the specified fluid to reservoir tank at MAX level.

5) Continue to turn the steering wheel slowly from lock to lock until the bubbles stop appearing on oil surface while keeping the fluid at the level in the Step 4).

6) If turning the steering wheel in low fluid level condition, air will be sucked in pipe. In this case, leave it about half an hour and then do the step 5) again.

7) Start the engine and let it idle.

8) Continue to turn the steering wheel slowly from lock to lock again until the bubbles stop appearing on oil surface while keeping the fluid at the level in Step 4).

Normally bubbles stop appearing after three times turning of steering wheel from lock to lock.

9) In case bubbles do not stop appearing in the tank, leave it about half an hour and then do the step 4) all over again.

10) Lower the vehicle, and then idle the engine.

11) Continue to turn the steering wheel from lock to lock until the bubbles stop appearing and change of the fluid level is within 3 mm (0.12 in).

12) In case the following happens, leave it about half an hour and then do step 8) to 11) again.

(1) The fluid level changes over 3 mm (0.12 in).

(2) Bubbles remain on the upper surface of the fluid.

(3) Grinding noise is generated from oil pump.

13) Check the fluid leakage after turning steering wheel from lock to lock with engine running.

General Diagnostic Table

POWER ASSISTED SYSTEM (POWER STEERING)

10. General Diagnostic Table

A: INSPECTION

Trouble	Possible cause	Corrective action
<ul style="list-style-type: none"> • Heavy steering effort in all ranges • Heavy steering effort at stand still • Steering wheel surges when turning. 	1. Pulley belt <ul style="list-style-type: none"> • Unequal length of pulley belts • Adhesion of oil and grease • Loose or damage of pulley belt • Poor uniformity of pulley belt cross section • Pulley belt touches to pulley bottom • Poor revolution of pulleys except oil pump pulley • Poor revolution of oil pump pulley 	Adjust or replace.
	2. Tire and wheel <ul style="list-style-type: none"> • Improper tires out of specification*1 • Improper wheel out of specification*1 • Tires not properly inflated 	Replace or reinflate.
	3. Fluid <ul style="list-style-type: none"> • Low fluid level • Aeration • Dust mix • Deterioration of fluid • Poor warming-up of fluid *2 	Refill, bleed air, replace or instruct customer.
	4. Idle speed <ul style="list-style-type: none"> • Lower idle speed • Excessive drop of idle speed at start or at turning steering wheel *3 	Adjust or instruct customer.
	5. Measure hydraulic pressure. <Ref. to PS-50, INSPECTION, Oil Pump.>	Replace the problem parts.
	6. Measure steering effort. <Ref. to PS-58, MEASUREMENT OF STEERING EFFORT, INSPECTION, General Diagnostic Table.>	Adjust or replace.
<ul style="list-style-type: none"> • Vehicle leads to one side or the other • Poor return of steering wheel to center • Steering wheel surges when turning. 	1. Fluid line <ul style="list-style-type: none"> • Folded hose • Flattened pipe 	Correct or replace.
	2. Tire and wheel <ul style="list-style-type: none"> • Flat tire • Mix use of different tires • Mix use of different wheels • Abnormal wear of tire • Unbalance of remained grooves • Unbalance of tire pressure 	Adjust, fix or replace.
	3. Front alignment <ul style="list-style-type: none"> • Improper or unbalance caster • Improper or unbalance toe-in • Loose connection of suspension 	Adjust or retighten.
	4. Others <ul style="list-style-type: none"> • Damaged joint assembly • Unbalanced height • Unbalanced weight 	Replace, adjust or instruct customer.
	5. Measure steering effort. <Ref. to PS-58, MEASUREMENT OF STEERING EFFORT, INSPECTION, General Diagnostic Table.>	Adjust or replace.

*1 If the tires or wheels are wider than specifications, the load to power steering system is increased. Accordingly, in a condition, for example before fluid warms-up, relief valve may work before maximum turning angle. In this case, steering effort may be heavy. When the measured hydraulic pressure is normal, there is no abnormal thing.

*2 In cold weather, steering effort may be heavy due to increased flow resistance of cold fluid. After warming-up engine, turn the steering wheel from stop to stop several times to warm-up fluid. Then if steering effort reduces normally, there is no abnormal thing.

General Diagnostic Table

POWER ASSISTED SYSTEM (POWER STEERING)

*3 In cold weather or with insufficient warm-up of engine, steering effort may be heavy due to excessive drop of idling when turning steering wheel. In this case, it is recommended to start the vehicle with increasing engine speed than usual. Then if steering effort reduces normally, there is no abnormal thing.

1. NOISE AND VIBRATION

CAUTION:

Do not keep the relief valve operated over five seconds at any time or inner parts of the oil pump may be damaged due to rapid increase of fluid temperature.

NOTE:

- Grinding noise may be heard immediately after the engine start in extremely cold condition. In this case, if the noise goes off during warm-up there is no abnormal function in the system. This is due to the fluid characteristic in extremely cold condition.
- Oil pump makes whine or growl noise slightly due to its mechanism. Even if the noise can be heard when steering wheel is turned at stand still, there is no abnormal function in the system provided that the noise eliminates when the vehicle is running.
- When turning the steering wheel with service brake and/or parking brake applied, the noise is generated by creaking between disc and pads. However this does not indicate abnormal function in system.
- There may be a little vibration around the steering devices when turning steering wheel at standstill, even though the component parts are properly adjusted and have no defects.

Hydraulic systems are likely to generate this kind of vibration as well as working noise and fluid noise because of combined conditions, i.e., road surface and tire surface, engine speed and turning speed of steering wheel, fluid temperature and braking condition.

These phenomena do not indicate there are some abnormal functions in the system.

Confirm the vibration by turning the steering wheel repeatedly at various speeds from slow to rapid step by step with parking brake applied on concrete road and in "D" range for AT model.

Trouble	Possible cause	Corrective action
Hiss noise (continuous) While engine is running.	Relief valve emits operating sound when steering wheel is completely turned in either direction. (Do not keep this condition over five seconds.)	Normal Operation
	Relief valve emits operating sound when steering wheel is not turned. This means that the relief valve is defective.	Replace the oil pump.
Rattling noise (intermittent) While engine is running.	Interference with adjacent parts	Check the clearance. Correct if necessary. <Ref. to PS-43, INSPECTION, Pipe Assembly.>
	Loosened installation of oil pump, oil tank, pump bracket, gearbox or crossmember	Retighten.
	Loosened installation of oil pump pulley or other pulley(s)	Retighten.
	Loosened linkage or play of steering or suspension Loosened tightening of joint or steering column	Retighten or replace.
	Sound generates from the inside of gearbox or oil pump.	Replace the faulty parts of the gearbox or oil pump.
Knocking When turning steering wheel in both directions with small angle repeatedly at engine ON or OFF.	Excessive backlash Loosened lock nut for adjusting backlash	Adjust and retighten.
	Loosened tightening or play of tie-rod, tie-rod end	Retighten or replace.
Grinding noise (continuous) While engine is running.	Vane pump aeration	Inspect and retighten the fluid line connection. Refill the fluid and vent air.
	Vane pump seizing	Replace the oil pump.
	Pulley bearing seizing of oil pump	Replace the oil pump.
	Folded hose, flattened pipe	Replace.

General Diagnostic Table

POWER ASSISTED SYSTEM (POWER STEERING)

Trouble	Possible cause	Corrective action
Squeal, squeak (intermittent or continuous) While engine is running.	Maladjustment of pulley belt Damaged or charged pulley belt Unequal length of pulley belts	Adjust or replace. (Replace two belts as a set.)
	Runout or defacement of V-groove surface of oil pump pulley	Clean or replace.
Sizzling noise (continuous) While engine is running.	Fluid aeration	Fix the wrong part causing aeration. Replace the fluid and vent air.
	Damaged pipe of gearbox	Replace the pipe.
	Abnormal inside of hose or pipe Flattened hose or pipe	Rectify or replace.
	Abnormal inside of oil tank	Replace.
	Removed oil tank cap	Install cap.
Whistle (continuous) While engine is running.	Abnormal pipe of gearbox or abnormal inside of hose	Replace the faulty parts of the gearbox or hose.
Whine or growl (intermittent or continuous) While engine is running with/ without steering turned.	Loosened installation of oil pump, oil pump bracket	Retighten.
	Abnormal inside of oil pump, hose	Replace the oil pump or hose, if the noise can be heard when running as well as stand still.
	Torque converter growl, air conditioner compression growl	Remove the power steering pulley belt and confirm.
Grinding noise (continuous) While engine is running with the steering turned.	Abnormal inside of gearbox	Replace the faulty parts of gearbox.
	Abnormal bearing for steering shaft	Apply grease or replace.
	Generates when turning steering wheel with brake (service or parking) applied.	If the noise goes off when brake is released, it is normal.
Vibration While engine is running with/ without steering turned.	Too low engine speed	Adjust and instruct customers.
	Vane pump aeration	Fix the wrong part. Vent air.
	Damaged valve in oil pump, gearbox	Replace the oil pump, faulty parts of gearbox.
	Looseness of play of steering, suspension parts	Retighten.

General Diagnostic Table

POWER ASSISTED SYSTEM (POWER STEERING)

2. MEASUREMENT OF STEERING EFFORT

Step	Check	Yes	No
1 CHECK STEERING EFFORT. 1) Stop the vehicle on a concrete road. 2) Start the engine. 3) Run the engine at idle. 4) Install a spring scale on the steering wheel. 5) Pull the spring scale at a right angle to the steering wheel, and measure both right and left steering wheel efforts. NOTE: When turning the steering more quickly than necessary from a direction to the other direction at an engine speed over 2,000 rpm, steering effort may be heavy. This is caused by flow characteristic of oil pump and is not defective.	Is the steering effort less than 29.4 N (3.0 kgf, 6.6 lb)?	Go to step 2.	Adjust the backlash.
2 CHECK STEERING EFFORT. 1) Stop the engine. 2) Pull the spring scale at a right angle to the steering wheel, and measure both right and left steering wheel efforts.	Is the steering effort less than 294.2 N (30 kgf, 66.2 lb)?	Go to step 3.	Perform adjustment.
3 CHECK STEERING WHEEL EFFORT. 1) Remove the universal joint. 2) Measure steering wheel effort.	Is steering effort less than 2.26 N (0.23 kgf, 0.51 lb)?	Go to step 4.	Check, adjust and replace if necessary.
4 CHECK STEERING WHEEL EFFORT. Measure steering wheel effort.	Is the difference of steering effort between clockwise and counterclockwise less than 20%?	Go to step 5.	Check, adjust and replace if necessary.
5 CHECK UNIVERSAL JOINT. Measure the swing torque of the joint (yoke of steering column side). <Ref. to PS-15, INSPECTION, Universal Joint.>	Is the swing torque less than 7.3 N (0.74 kgf, 1.64 lb)?	Go to step 6.	Replace with a new one.
6 CHECK UNIVERSAL JOINT. Measure the swing torque of the joint (yoke of gearbox side). <Ref. to PS-15, INSPECTION, Universal Joint.>	Is the swing torque less than 3.8 N (0.39 kgf, 0.86 lb)?	Go to step 7.	Replace with a new one.
7 CHECK FRONT WHEEL. Check the front wheel.	If the front wheels have unsteady revolution or rattling and brake for dragging?	Inspect, readjust and replace if necessary.	Go to step 8.
8 CHECK TIE-ROD ENDS. Remove the tie-rod ends.	If the tie-rod ends of suspension have unsteady revolution or rattling?	Inspect and replace if necessary.	Go to step 9.
9 CHECK BALL JOINT. Remove the ball joint.	If the ball joints of suspension have unsteady revolution or rattling?	Inspect and replace if necessary.	Go to step 10.
10 CHECK GEARBOX. Measure the rotating of gearbox. <Ref. to PS-37, TURNING RESISTANCE OF GEARBOX, INSPECTION, Steering Gearbox.>	Is the rotating resistance of steering gearbox less than 10.5 N (1.1 kgf, 2.4 lb)? Is the difference between clockwise and counterclockwise less than 20%?	Go to step 11.	Readjust the backlash, and if ineffective, replace the faulty parts.
11 CHECK GEARBOX. Measure the sliding of gearbox. <Ref. to PS-36, SERVICE LIMIT, INSPECTION, Steering Gearbox.>	Is the sliding resistance of steering gearbox less than 314 N (32 kgf, 71 lb)? Is the difference between right and left sliding resistances less than 20%?	Steering effort is normal.	Readjust the backlash, and if ineffective, replace the faulty parts.

General Diagnostic Table

POWER ASSISTED SYSTEM (POWER STEERING)

3. INSPECTION OF CLEARANCE

This table lists various clearances that must be correctly adjusted to ensure the normal vehicle driving without interfering noise, or any other faults.

LOCATION	Minimum allowance mm (in)
(1) Crossmember-to-Hose ASSY	3 (0.12)
(2) Front exhaust pipe-to-Hose ASSY (Turbo model)	15 (0.59)
(3) Front frame side-to-Hose ASSY	10 (0.39)
(4) Turbo cover-to-Hose ASSY (Turbo model)	10 (0.39)
(5) Master cylinder-to-Return hose (Turbo model)	10 (0.39)
(6) Master cylinder-to-Hose clip (Model with vehicle dynamics control (VDC))	10 (0.39)
(7) VDC H/U-to-Hose ASSY (Model with vehicle dynamics control (VDC))	5 (0.20)
(8) Air cleaner-to-Hose ASSY (Turbo model)	5 (0.20)
(9) Air boot-to-Hose ASSY	10 (0.39)
(10) Protector-to-Hose ASSY (Turbo model, DOHC non-turbo model)	10 (0.39)
(11) Blow-by-to-Hose ASSY (Turbo model)	8 (0.31)
(12) Over flow hose-to-Hose ASSY (Turbo model)	8 (0.31)
(13) Brake pipe-to-Return hose (Model with ABS)	10 (0.39)
(14) Front suspension bracket-to-Return hose	5 (0.20)
(15) Front wheel apron-to-Return hose	5 (0.20)

General Diagnostic Table

POWER ASSISTED SYSTEM (POWER STEERING)

PS-00515

General Description

HVAC SYSTEM (HEATER, VENTILATOR AND A/C)

1. General Description

A: SPECIFICATION

1. HEATER SYSTEM

Item		Specification	On condition
Heating capacity		5.2 kW (4,471 kcal/h, 17,743 BTU/h) or more	<ul style="list-style-type: none"> Mode selector switch: HEAT Temperature control switch: FULL HOT Temperature difference between hot water and inlet air: 65°C (149°F) Hot water flow rate: 360 \varnothing (95.1 US gal, 79.2 Imp gal)/h
Air flow rate		320 m ³ (11,301 cu ft)/h	Heat mode (FRESH), FULL HOT at 12.5 V
Max air flow rate		460 m ³ (16,245 cu ft)/h	<ul style="list-style-type: none"> Temperature control switch: FULL COLD Blower fan speed: Auto A/C: 6th position Manual A/C: 4th position Mode selector lever: RECIRC
Heater core size (height × length × width)		264 × 110 × 27 mm (10.4 × 4.33 × 1.06 in)	—
Blower motor	Type	Magnet motor 220 W or less	12 V
	Fan type and size (diameter × width)	Sirocco fan type 150 × 75 mm (5.91 × 2.95 in)	—

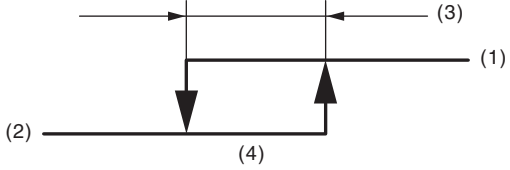

2. A/C SYSTEM

- Auto A/C model

Item		Specification
Type of air conditioner		Reheat air-mix type
Cooling capacity		5.3 kW (4,557 kcal/h, 18,084 BTU/h)
Refrigerant		HFC-134a (CH ₂ FCF ₃) [0.4±0.03 kg (0.88±0.07 lb)]
Compressor	Type	Scroll, constant volume (SCSA 08C)
	Discharge	74.5 cc (4.55 cu in)/rev
	Max. permissible speed	9,000 rpm
Magnet clutch	Type	Dry, single-disc type
	Power consumption	35 W
	Type of belt	2.5 L SOHC Non-turbo and 2.5 L DOHC Turbo model: V-belt 4 PK 3.0 L DOHC Non-turbo model: V-belt 6 PK
	Pulley dia. (effective dia.)	93 mm (3.7 in)
	Pulley ratio	1.43
Condenser	Type	Corrugated fin (Sub cool type)
	Core face area	0.193 m ² (2.077 sq ft)
	Core thickness	16 mm (0.63 in)
	Radiation area	5.72 m ² (61.57 sq ft)
Receiver drier	Effective inner capacity	190 cm ³ (11.6 cu in)
Expansion valve	Type	Internal equalizing
Evaporator	Type	Single tank
	Dimensions (W × H × T)	298.6 × 151 × 38 mm (11.76 × 5.94 × 1.50 in)
Blower fan	Fan type	Sirocco fan
	Outer diameter × width	150 × 75 mm (5.91 × 2.95 in)
	Power consumption	220 W

General Description

HVAC SYSTEM (HEATER, VENTILATOR AND A/C)

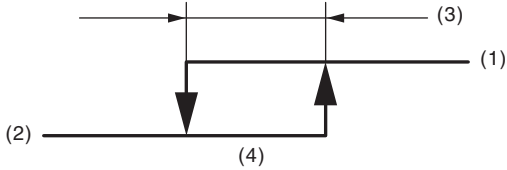

Condenser fan (Sub fan)		Motor type	Magnet
		Power consumption	2.5 L SOHC Non-turbo model: 90 W 2.5 L DOHC Turbo model: 120 W 3.0 L DOHC Non-turbo model: 160 W

6. HEATER DUCT

AC-00913

- (1) Front defroster nozzle
- (2) Side ventilation duct (LH)

- (3) Side ventilation duct (RH)
- (4) Center ventilation duct

- (5) Rear heater duct (LH)
- (6) Rear heater duct (RH)

General Description

HVAC SYSTEM (HEATER, VENTILATOR AND A/C)

C: CAUTION

1. HFC-134a A/C SYSTEM

- The cooling system components for the HFC-134a system such as the refrigerant and compressor oil are different from the conventional CFC-12 system components and they are incompatible with each other.
- Vehicles with the HFC-134a system can be identified by the label (A) attached to the vehicle. Before maintenance, check which A/C system is installed to the vehicle.

2. COMPRESSOR OIL

- HFC-134a compressor oil has no compatibility with that of CFC-12 system.
 - Use only Denso Oil 8 which is a manufacturer-authorized compressor oil for HFC-134a system.
 - Do not mix multiple compressor oils.
- If CFC-12 compressor oil is used in the HFC-134a A/C system, the compressor may become stuck due to poor lubrication, or the refrigerant may leak due to swelling of rubber parts.
- On the other hand, if HFC-134a compressor oil is used in a CFC-12 A/C system, the durability of the A/C system will be lowered.
- HFC-134a compressor oil is very hygroscopic. When replacing or installing/removing A/C parts, immediately isolate the oil from atmosphere using a plug or tape. In order to avoid moisture, store the oil in a container with its cap tightly closed.

3. REFRIGERANT

- The CFC-12 refrigerant cannot be used in the HFC-134a A/C system. The HFC-134a refrigerant, also, cannot be used in the CFC-12 A/C system.
- If an incorrect or no refrigerant is used, it will result in poor lubrication and the compressor itself may be damaged.

4. HANDLING OF REFRIGERANT

- The refrigerant boils at approx. -30°C (-22°F). When handling it, be sure to wear protective goggles and protective gloves. Direct contact of the refrigerant with skin may cause frostbite. If the refrigerant gets into your eye, avoid rubbing your eyes with your hands. Wash your eye with plenty of water, and receive medical treatment from an eye doctor.
- Do not heat a service can. If a service can is directly heated, or put into boiling water, the inside pressure will become extremely high. This may cause the can to explode. If a service can must be warmed up, use hot water in 40°C (104°F) max.
- Do not drop or impact a service can. (Observe the precautions and operation procedure described on the refrigerant can.)
- When the engine is running, do not open the high-pressure valve of manifold gauge. The high-pressure gas will back-flow resulting in an explosion of the can.
- Provide good ventilation and do not work in a closed area.
- In order to prevent global warming, avoid releasing HFC-134a into the atmosphere. Using a refrigerant recovery system, discharge and reuse it.

- (A) Goggles
- (B) Gloves
- (C) Avoid open flame
- (D) No direct heat on container
- (E) Do not discharge
- (F) Loosen

General Description

HVAC SYSTEM (HEATER, VENTILATOR AND A/C)

5. O-RING CONNECTIONS

- Always use a new O-ring.
- In order to keep the O-rings free of lint which will cause a refrigerant gas leak, perform operations without gloves and cloth.
- Apply compressor oil to O-rings to avoid sticking, before installation.
- Use a torque wrench to tighten the O-ring fittings. Over-tightening will result in damage of O-ring and tube end distortion.
- If the operation is interrupted before completing a pipe connection; recap the tubes, components and fittings with a plug or tape to prevent foreign matter from entering.

(A) Seal

- Visually check the surfaces and mating surfaces of O-rings, threads and connecting points. If a failure is found, replace the applicable parts.
- Install the O-rings at right angle to tube beads.

- (A) O-ring
- (B) OK
- (C) NG
- (D) Bead

- Use compressor oil specified in the service manual to lubricate the O-rings. Apply oil to the top and sides of O-rings before installation. Apply compressor oil to the bead of tube.

- After tightening, use a clean cloth to remove excess compressor oil from the connections and any oil which may have run on the vehicle body or other parts.
- If any leakage is suspected after tightening, do not further tighten the connections, but disconnect the connections, remove the O-rings, and check the O-rings, threads, and connections.

General Description

HVAC SYSTEM (HEATER, VENTILATOR AND A/C)

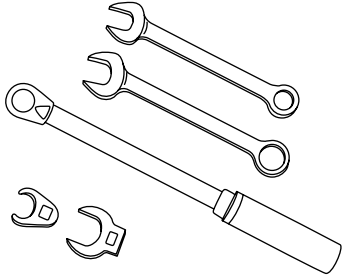

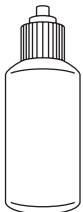

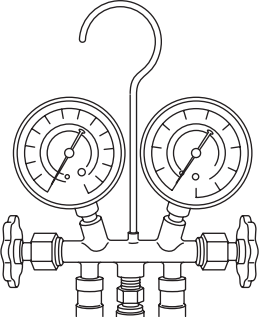

D: PREPARATION TOOL

CAUTION:

When working on vehicles with HFC-134a system, only use HFC-134a specified tools and parts. Do not mix with those of CFC-12. If HFC-134a and CFC-12 refrigerant or compressor oil is mixed, it will result in poor lubrication and the compressor itself may be destroyed.

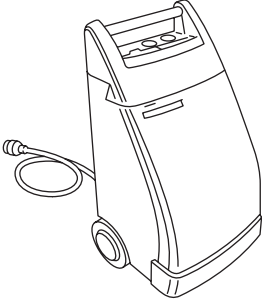

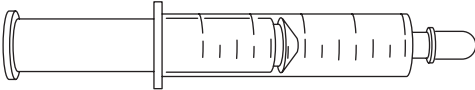

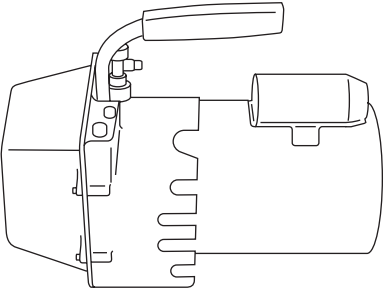

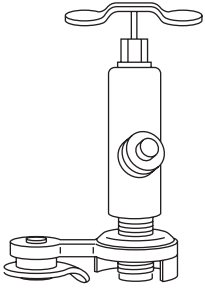

In order to prevent the mixture of HFC-134a and CFC-12 parts and liquid, the tool and screw type and the type of service valves used are different. The gas leak detectors for the HFC-134a and CFC-12 systems must also not be interchanged.

	HFC-134a	CFC-12
Tool & screw type	Millimeter size	Inch size
Valve type	Quick joint type	Screw-in type

Refrigerant Pressure with Manifold Gauge Set

HVAC SYSTEM (HEATER, VENTILATOR AND A/C)

2. Refrigerant Pressure with Manifold Gauge Set

A: PROCEDURE

- 1) Place the vehicle in the shade and windless condition.
- 2) Connect the manifold gauge set.
- 3) Open the front windows and close all doors.
- 4) Open the front hood.
- 5) Increase the engine to 1,500 rpm.
- 6) Turn on the A/C switch.
- 7) Turn the temperature control switch to MAX COOL.
- 8) Put in RECIRC position.
- 9) Turn the blower control switch to HI.
- 10) Read the gauge.

Standard:

Low pressure: 127 — 196 kPa (1.3 — 2.0 kg/cm², 18 — 28 psi)

High pressure: 1,471 — 1,667 kPa (15 — 17 kg/cm², 213 — 242 psi)

Ambient temperature: 30 — 35°C (86 — 95°F)

B: INSPECTION

Symptom	Probable cause	Repair order
High-pressure side is unusually high.	<ul style="list-style-type: none">• Defective condenser fan motor• Clogged condenser fin• Too much refrigerant• Air inside the system• Defective receiver dryer	<ul style="list-style-type: none">• Replace the fan motor.• Clean the condenser fin.• Discharge refrigerant.• Replace the receiver dryer.• After evacuating again, charge an appropriate amount of refrigerant.
High-pressure side is unusually low.	<ul style="list-style-type: none">• Defective compressor• Not enough refrigerant• Clogged expansion valve• Expansion valve frozen temporarily by moisture.	<ul style="list-style-type: none">• Replace the compressor.• Check for leaks.• Replace the expansion valve.• Fully evacuate the expansion valve.
Low-pressure side is unusually high.	<ul style="list-style-type: none">• Defective compressor• Defective expansion valve• Too much refrigerant	<ul style="list-style-type: none">• Replace the compressor.• Replace the expansion valve.• Discharge refrigerant.
Low-pressure side is unusually low.	<ul style="list-style-type: none">• Not enough refrigerant• Clogged expansion valve• Expansion valve frozen temporarily by moisture.• Saturated receiver dryer	<ul style="list-style-type: none">• Check for leaks.• Replace the expansion valve.• Replace the receiver dryer.

Refrigerant Recovery Procedure

HVAC SYSTEM (HEATER, VENTILATOR AND A/C)

3. Refrigerant Recovery Procedure

A: PROCEDURE

CAUTION:

- During operation, be sure to wear protective goggles and protective gloves.
- Connect the refrigerant recovery system with the manifold gauge set to discharge the refrigerant from the A/C system and reuse it.
- When reusing the discharged refrigerant, keep service cans on hand. Because the discharge rate with the recovery system is approx. 90%, service cans are necessary to charge the refrigerant.
- Follow the detailed operation procedure described in the operation manual attached to the refrigerant recovery system.

- 1) Perform the compressor oil return operation. <Ref. to AC-25, PROCEDURE, Compressor Oil.>
- 2) Stop the engine.
- 3) Make sure the valves on low-/high-pressure sides of manifold gauge set are fully closed.

- (A) Low-pressure gauge (Compound pressure gauge)
- (B) High-pressure gauge
- (C) Close

- 4) Install the low-/high-pressure hoses to the service ports on the low-/high-pressure sides of the vehicle respectively.

- (A) Low-pressure gauge (Compound pressure gauge)
- (B) High-pressure gauge
- (C) Close
- (D) Low-pressure side service port
- (E) High-pressure side service port

- 5) Connect the center hose to the refrigerant recovery system.
- 6) Follow the operation manual to activate the refrigerant recovery system.

Refrigerant Charging Procedure

HVAC SYSTEM (HEATER, VENTILATOR AND A/C)

4. Refrigerant Charging Procedure

A: PROCEDURE

CAUTION:

- During operation, be sure to wear protective goggles and protective gloves.
- Before charging the refrigerant, evacuate the system to remove small amounts of moisture remaining in the system.

The moisture in the system can be completely evacuated only under the minimum vacuum level. The minimum vacuum level affects the temperature in the system.

- The list below shows the vacuum values necessary to boil water in various temperature. In addition, the vacuum levels indicated on the gauge are approx. 3.3 kPa (25 mmHg, 0.98 inHg) lower than those measured at 304.8 m (1,000 ft) above sea level.

Vacuum level required to boil water (at sea level)	
Temperature	Vacuum
1.7°C (35°F)	100.9 kPa (757 mmHg, 29.8 inHg)
7.2°C (45°F)	100.5 kPa (754 mmHg, 29.7 inHg)
12.8°C (55°F)	99.8 kPa (749 mmHg, 29.5 inHg)
18.3°C (65°F)	99.2 kPa (744 mmHg, 29.3 inHg)
23.9°C (75°F)	98.5 kPa (739 mmHg, 29.1 inHg)
29.4°C (85°F)	97.2 kPa (729 mmHg, 28.7 inHg)
35°C (95°F)	95.8 kPa (719 mmHg, 28.3 inHg)

1) Close the valves on low-/high-pressure sides of the manifold gauge.

- (A) Low-pressure gauge (Compound pressure gauge)
- (B) High-pressure gauge
- (C) Close

2) Install the low-/high-pressure hoses to the corresponding service ports on the vehicle respectively.
3) Connect the center hose of the manifold gauge set with the vacuum pump.

4) Carefully open the valves on the low-/high-pressure sides to activate the vacuum pump.

- (A) Low-pressure gauge (Compound pressure gauge)
- (B) High-pressure gauge
- (C) Slowly open
- (D) Vacuum pump turn on

5) After the low-pressure gauge reaches 100.0 kPa (750 mmHg, 29.5 inHg) or higher, evacuate the system for approx. 15 minutes. (Continue evacuation).

6) After 15 minutes of evacuation, if the reading shows 100.0 kPa (750 mmHg, 29.5 inHg) or higher, close the valves on the both sides to stop the vacuum pump.

- (A) Low-pressure gauge (Compound pressure gauge)
- (B) High-pressure gauge
- (C) Close
- (D) Vacuum pump turn off

Refrigerant Charging Procedure

HVAC SYSTEM (HEATER, VENTILATOR AND A/C)

7) Note the low-pressure gauge reading.

AC-00027

8) Leave it at least 5 minutes, and then check the low-pressure gauge reading for any changes.

When a gauge indicator shows near to zero point, it is a sign of leakage. Check pipe connector points, repair them, make sure there is no leakage by air bleeding.

9) Following the can tap operation manual instructions, install it to the refrigerant can.

AC-00028

- (A) Tap valve
- (B) Center manifold hose

10) Disconnect the center manifold hose from the vacuum pump, and connect the hose to the tap valve.

11) When a 13.6 kg (30 lb) refrigerant container is used, measure the refrigerant amount in use using a weight scale.

AC-00029

- (A) Refrigerant container (HFC-134a)
- (B) Weight scale

12) Confirm that all the 3 hoses are tightly connected to the manifold gauge set.

AC-00030

- (A) Low-pressure gauge (Compound pressure gauge)
- (B) High-pressure gauge
- (C) Close

13) Open the valve on the HFC-134a source.

14) Loosen the center hose connection on the manifold gauge set (if applicable, press a purge valve on the manifold gauge set) only for a couple of seconds to allow the air in the center hose to escape by the refrigerant.

15) Carefully open the high-pressure valve with the engine stopping.

CAUTION:

Do not open the low-pressure valve.

AC-00031

- (A) Low-pressure gauge (Compound pressure gauge)
- (B) High-pressure gauge
- (C) Close
- (D) Ignition switch OFF
- (E) Slowly open

CAUTION:

Never run the engine during charging from the high-pressure side.

16) Close the high-pressure valve when the low-pressure gauge reaches 98 kPa (1 kg/cm², 14 psi). Using a leak tester, check the system for leaks.

If any leakage is found after the refrigerant recovery is completed, repair the applicable area.

Refrigerant Charging Procedure

HVAC SYSTEM (HEATER, VENTILATOR AND A/C)

17) After confirming that there are no leaks with the leak test, charge the required amount of refrigerant.

CAUTION:

Never run the engine during charging from the high-pressure side.

- 18) Close the high-pressure valve when;
- the readings of low- / high-pressure gauges become almost equal, after the charging speed is reduced,
 - the HFC-134a source becomes empty, or the system is filled with the gas.

19) If the HFC-134a source is empty, close the high-pressure valve, close the valve on the can tap, and replace the HFC-134a source with a new one to restart the operation.

- (A) Low-pressure gauge (Compound pressure gauge)
- (B) High-pressure gauge
- (C) Close

20) Confirm that both the low-/high-pressure valves can be closed. Start the engine with the A/C switch OFF.

21) Quickly repeat ON-OFF cycles a few times to prevent initial compressor damage.

22) Set up the vehicle to the following status:

- A/C switch ON
- Engine running at 1,500 rpm
- Blower speed setting to "HI"
- Temperature setting to "MAX COOL"
- Air inlet setting to "RECIRC"
- Window open

23) While reading the low-pressure gauge, carefully open the low-pressure valve with the refrigerant source connected and the service hose purged.

CAUTION:

Never open the high-pressure valve with the engine running. The high-pressure gas will back-flow resulting in an explosion of the can.

24) Adjust the refrigerant flow to maintain the pressure on the low-pressure side at 276 kPa (2.81 kg/cm², 40 psi) max.

25) After the system is fully charged, close the low-pressure valve.

26) Close the valve on the refrigerant source.

Refrigerant amount		
Refrigerant	Minimum	Maximum
HFC-134a	370 g (0.82 lb)	430 g (0.95 lb)

27) Disconnect the hose from the service port, and install the service port cap.

Refrigerant Leak Check

HVAC SYSTEM (HEATER, VENTILATOR AND A/C)

5. Refrigerant Leak Check

A: INSPECTION

1) Operate the A/C system for approx. 10 minutes, and confirm that the high-side pressure shows at least 690 kPa (7.03 kg/cm², 100 psi). Then stop the engine to start the leak test.

2) Starting from the connection between high-pressure pipe and evaporator, check the system for leaks along the high-pressure side through the compressor. The following items must be checked thoroughly.

3) Check the joint and seam between pressure switch (dual switch) and high-pressure pipe.

4) Check the connections between condenser and pipes, and welded joints on the condenser.

The leak tester may detect the oil on the condenser fins as a leak.

5) Check the joint between compressor and hoses.

6) Check the machined area of compressor and other joints on the compressor.

7) Check the compressor shaft seal at the area near the center of compressor clutch pulley.

Some shaft seals show a slight amount of leakage about 3 g (0.1 oz.) per year. This is not a problem.

8) Starting from the connection between low-pressure pipe and evaporator, check the system for leakage along the low-pressure side through the compressor. The following items must be checked thoroughly.

- Connection between 2 parts
- Connection between pipe and plate

9) Visually check the rubber area of the flexible hose for cracks.

Check the entire length of the flexible hose, especially the connection with the metal hose end.

CAUTION:

Carefully check the external surface of hoses and tubes at approx. 25 mm (0.98 in) per second.

(A) Flexible hose

10) Disconnect the drain hose from heater case, and check the hose end for at least 10 seconds.

After the test is finished, reconnect the drain hose.

11) Turn the ignition key to ON position, and run the blower at high speed for approx. 1 minute. Stop the blower to check the ventilation grille on the instrument panel. While moving the tester closer to the grille, run the blower for 1 or 2 seconds, then stop it. Check the grille at that point for at least 10 seconds.

12) Check the valve in the service port.

13) Visually check the rubber seal in the service port cap.

6. Compressor Oil

A: PROCEDURE

NOTE:

Before servicing, perform the oil return operation to return the compressor oil in circulation with the refrigerant to the compressor.

- 1) Increase the engine to 1,500 rpm.
- 2) Turn ON the A/C switch.
- 3) Turn the temperature control switch to MAX COOL.
- 4) Put in RECIRC position.
- 5) Turn the blower control switch to HI.
- 6) Leave in this condition for 10 minutes.

B: REPLACEMENT

NOTE:

- If a component has been replaced, add an appropriate amount of compressor oil (same as the amount of remaining oil in removed component).
- When replacing the compressor, the new compressor will already have the specified amount of oil in it. Install the new compressor after removing the same amount of oil remained in the removed compressor.

Blower Motor Unit Assembly

HVAC SYSTEM (HEATER, VENTILATOR AND A/C)

7. Blower Motor Unit Assembly

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Remove the glove box. <Ref. to EI-51, REMOVAL, Glove Box.>
- 3) Disconnect the connectors of A/C control module, intake door actuator, blower motor, power transistor and blower resistor.
- 4) Loosen the bolts and nut to remove blower motor unit assembly.

B: INSTALLATION

Install in the reverse order of removal.

Tightening torque:

*Refer to "COMPONENT" of "General Description". <Ref. to AC-5, HEATER COOLING UNIT, COMPONENT, General Description.>
<Ref. to AC-8, BLOWER MOTOR UNIT, COMPONENT, General Description.>*

Blower Motor

HVAC SYSTEM (HEATER, VENTILATOR AND A/C)

8. Blower Motor

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Remove the glove box lower cover. <Ref. to EI-51, REMOVAL, Glove Box.>
- 3) Disconnect the connector of blower motor.
- 4) Loosen the screw to remove blower motor.

B: INSTALLATION

Install in the reverse order of removal.

C: INSPECTION

Connect the battery positive (+) terminal to terminal No. 2 of blower motor, and negative (-) terminal to terminal No. 1. Check the blower motor for smooth rotation.

Power Transistor (Auto A/C Model)

HVAC SYSTEM (HEATER, VENTILATOR AND A/C)

9. Power Transistor (Auto A/C Model)

A: REMOVAL

- 1) Remove the glove box lower cover on passenger side. <Ref. to EI-51, REMOVAL, Glove Box.>
- 2) Disconnect the power transistor connector.
- 3) Remove the two screws, and then remove the power transistor.

B: INSTALLATION

Install in the reverse order of removal.

10. Blower Resistor (Manual A/C Model)

A: REMOVAL

- 1) Remove the glove box lower cover on passenger side. <Ref. to EI-51, REMOVAL, Glove Box.>
- 2) Disconnect the blower resistor connector.
- 3) Remove the two screws, and then remove the blower resistor.

B: INSTALLATION

Install in the reverse order of removal.

C: INSPECTION

Measure the blower resistor resistance.

Terminal No.	Standard
4 and 2	Approx. 0.44 Ω
4 and 3	Approx. 1.12 Ω
4 and 1	Approx. 2.92 Ω

If NG, replace the blower resistor.

Heater Core

HVAC SYSTEM (HEATER, VENTILATOR AND A/C)

11.Heater Core

A: REMOVAL

- 1) Remove the heater and cooling unit. <Ref. to AC-37, REMOVAL, Heater and Cooling Unit.>
- 2) Remove the screws and remove the heater core cover and pipe clamp.

- 3) Remove the heater core (A).

B: INSTALLATION

Install in the reverse order of removal.

12. Control Panel (Auto A/C Model)

A: REMOVAL

- 1) Remove the audio assembly. <Ref. to ET-5, REMOVAL, Audio.>
- 2) Remove the six screws.

NOTE:

When working the removed audio assembly with its back facing down, place wooden blocks between the audio assembly and the workbench to prevent ground terminal from folding.

- 3) Using a fine flat tip screwdriver, remove the ten hooks gradually in the order of both sides, lower and upper side.

(A) Hook

- 4) Pull the panel straight toward you to remove.

CAUTION:

Be careful not to touch the logic board to prevent static electricity damage.

B: INSTALLATION

- 1) Fit the hooks. Make sure the firm connection between logic board and connector by pushing the center part of panel with fingertips.
- 2) Install in the reverse order of removal.

Control Unit (Manual A/C Model)

HVAC SYSTEM (HEATER, VENTILATOR AND A/C)

13. Control Unit (Manual A/C Model)

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Remove the instrument panel lower cover. <Ref. to EI-50, REMOVAL, Instrument Panel Lower Cover.>
- 3) Remove the control wires.

- 4) Remove the audio assembly. <Ref. to ET-5, REMOVAL, Audio.>
- 5) Loosen the screw to remove the control unit from bracket.

B: INSTALLATION

Install in the reverse order of removal.

Control Unit (Auto A/C Model)

HVAC SYSTEM (HEATER, VENTILATOR AND A/C)

14. Control Unit (Auto A/C Model)

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Remove the glove box. <Ref. to EI-51, REMOVAL, Glove Box.>
- 3) Remove the screw, disconnect the connector and remove the control unit.

B: INSTALLATION

Install in the reverse order of removal.

Compressor

HVAC SYSTEM (HEATER, VENTILATOR AND A/C)

15. Compressor

A: INSPECTION

1. MAGNETIC CLUTCH CLEARANCE

Check the clearance of entire circumference around the drive plate and pulley.

Standard:

$0.45 \pm 0.15 \text{ mm}$ ($0.0177 \pm 0.0059 \text{ in}$)

2. MAGNETIC CLUTCH OPERATION

- 1) Disconnect the compressor connector.
- 2) Connect the battery positive (+) terminal to terminal No. 1 of compressor connector, and negative (-) terminal to terminal No. 2.

- 3) Check the magnet clutch engagement.
If NG, replace the compressor.

B: REMOVAL

- 1) Perform the compressor oil return operation. <Ref. to AC-25, PROCEDURE, Compressor Oil.>
- 2) Turn the A/C switch to OFF and stop the engine.
- 3) Using the refrigerant recovery system, discharge refrigerant. <Ref. to AC-20, PROCEDURE, Refrigerant Recovery Procedure.>
- 4) Disconnect the ground cable from battery.
- 5) Remove the V-belts. <Ref. to ME(H4SO)-37, REMOVAL, V-belt.> <Ref. to ME(H4DOTC)-37, REMOVAL, V-belt.> <Ref. to ME(H6DO)-32, REMOVAL, V-belt.>
- 6) Remove the generator. <Ref. to SC(H4SO)-20, REMOVAL, Generator.>
- 7) Remove the bolt and remove the low-pressure hose and high-pressure hose.

- 8) Disconnect the compressor harness from body harness.
- 9) Remove the bolts and remove compressor bracket.

- H4 model

- H6 model

- 10) Remove the bolts, and then remove the bracket from compressor.

C: INSTALLATION

- 1) Install in the reverse order of removal.
- 2) Replace the O-rings on low-/high-pressure hoses with new ones, then apply compressor oil.
- 3) When replacing the compressor, adjust amount of compressor oil. <Ref. to AC-25, PROCEDURE, Compressor Oil.>
- 4) Charge refrigerant. <Ref. to AC-21, PROCEDURE, Refrigerant Charging Procedure.>

Tightening torque:

***Refer to “COMPONENT” of “General Description”. <Ref. to AC-10, AIR CONDITIONING UNIT, COMPONENT, General Description.>
<Ref. to AC-11, COMPRESSOR, COMPONENT, General Description.>***

Condenser

HVAC SYSTEM (HEATER, VENTILATOR AND A/C)

16. Condenser

A: REMOVAL

- 1) Using the refrigerant recovery system, discharge refrigerant. <Ref. to AC-20, PROCEDURE, Refrigerant Recovery Procedure.>
- 2) Disconnect the ground cable from battery.
- 3) Disconnect the pressure hose and pipe from condenser.

- 4) Remove the radiator bracket (A) and hood stay (B).

- 5) Remove the front grille. <Ref. to EI-24, REMOVAL, Front Grille.>
- 6) Remove two bolts. While lifting condenser, pull it out through the space between radiator and radiator panel.

CAUTION:

- Be careful not to damage the condenser fins. If a damaged fin is found, repair it using a thin screwdriver.

- If the condenser is replaced, add an appropriate amount of compressor oil to the compressor. <Ref. to AC-25, REPLACEMENT, Compressor Oil.>

B: INSTALLATION

- 1) Install in the reverse order of removal.

CAUTION:

Replace the O-rings on hoses or pipes with new ones, and then apply compressor oil. Confirm that lower guide of condenser (A) has been fitted into holes on radiator panel.

- 2) Charge refrigerant. <Ref. to AC-21, PROCEDURE, Refrigerant Charging Procedure.>

Tightening torque:

Refer to "COMPONENT" of "General Description". <Ref. to AC-10, AIR CONDITIONING UNIT, COMPONENT, General Description.> <Ref. to CO(H4SO)-5, RADIATOR AND RADIATOR FAN, COMPONENT, General Description.>

C: INSPECTION

- 1) Check no dust or insects are found on the condenser fins. Air-blow or flush fins with water as needed.
- 2) Inspect for oil leakage from condenser. If a failure is found, replace the condenser with a new one.

17.Heater and Cooling Unit

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Using the refrigerant recovery system, discharge refrigerant. <Ref. to AC-20, PROCEDURE, Refrigerant Recovery Procedure.>
- 3) Drain engine coolant from the radiator.
- 4) Remove the bolts securing expansion valve and pipe in engine compartment. Release the heater hose clamps in engine compartment to remove the hoses.

- 5) Remove the instrument panel. <Ref. to EI-56, REMOVAL, Instrument Panel Assembly.>
- 6) Remove the support beam.
- 7) Remove the blower motor unit assembly. <Ref. to AC-26, REMOVAL, Blower Motor Unit Assembly.>
- 8) Disconnect the actuator connector.
- 9) Remove the bolt and nuts to remove the heater and cooling unit.

B: INSTALLATION

- 1) Install in the reverse order of removal.
- 2) Charge refrigerant. <Ref. to AC-21, PROCEDURE, Refrigerant Charging Procedure.>

Tightening torque:

Refer to “COMPONENT” of “General Description”. <Ref. to AC-5, HEATER COOLING UNIT, COMPONENT, General Description.>

Evaporator

HVAC SYSTEM (HEATER, VENTILATOR AND A/C)

18. Evaporator

A: REMOVAL

- 1) Using the refrigerant recovery system, discharge refrigerant. <Ref. to AC-20, PROCEDURE, Refrigerant Recovery Procedure.>
- 2) Disconnect the ground cable from battery.
- 3) Remove the blower motor unit assembly. <Ref. to AC-26, REMOVAL, Blower Motor Unit Assembly.>
- 4) Disconnect the connector, remove the screw and then remove the air-mix door actuator and mode door actuator.

- 5) Disconnect the connector, remove the screw and remove the pipe cover and evaporator sensor.

- 6) Remove the bolts securing expansion valve and pipe in engine compartment.

- 7) Remove the bolt which holds the pipe to evaporator.

- 8) Remove the screws and clip to remove the evaporator cover.

- 9) Pull out the evaporator (A) in the direction of arrow.

CAUTION:

If the evaporator is replaced, add an appropriate amount of compressor oil to evaporator. <Ref. to AC-25, REPLACEMENT, Compressor Oil.>

B: INSTALLATION

Install in the reverse order of removal.

19.Hose and Tube

A: REMOVAL

CAUTION:

• When disconnecting/connecting hoses, do not apply an excessive force to them. Confirm that no torsion and excessive tension is charged after installing.

• Seal the disconnected hose with a plug or vinyl tape to prevent foreign matter from entering.

- 1) Disconnect the ground cable from battery.
- 2) Using the refrigerant recovery system, discharge refrigerant. <Ref. to AC-20, PROCEDURE, Refrigerant Recovery Procedure.>
- 3) Remove the evaporator unit mounting bolt (A) and low-pressure hose bracket bolt (B).
- 4) Remove the low-pressure hose attaching bolts (C).
- 5) Disconnect the low-pressure hose from evaporator unit.
- 6) Disconnect the low-pressure hose from compressor.
- 7) Remove the low-pressure hose from vehicle.
- 8) Remove the high-pressure hose attaching bolt (D).
- 9) Disconnect the high-pressure hose from compressor.
- 10) Disconnect the high-pressure hose from condenser.
- 11) Remove the high-pressure hose from vehicle.
- 12) Remove the high-pressure attaching bolt (E).
- 13) Remove the high-pressure tube from vehicle.

B: INSTALLATION

CAUTION:

• When disconnecting or connecting the hoses, do not apply excessive force to them. Confirm that no torsion and excessive tension is charged after installing.

• Seal the disconnected hose with a plug or vinyl tape to prevent foreign matter from entering.

- 1) Install in the reverse order of removal.
- 2) Charge refrigerant. <Ref. to AC-21, PROCEDURE, Refrigerant Charging Procedure.>

Tightening torque:

Refer to "COMPONENT" of "General Description". <Ref. to AC-10, AIR CONDITIONING UNIT, COMPONENT, General Description.>

C: INSPECTION

Check the hoses for cracks, damage and expansion. If any fault is found, replace them with new ones.

Relay and Fuse

HVAC SYSTEM (HEATER, VENTILATOR AND A/C)

20. Relay and Fuse

A: LOCATION

- (1) Joint box
- (2) Main fuse box

Main Fan Relay 1	(A)
Main Fan Relay 2	(B)
Sub Fan Relay	(C)
A/C Relay	(D)
A/C Fuse	(E)

B: INSPECTION

- (3) — (4): Continuity exists
- (1) — (2): Continuity does not exist

While applying battery voltage to the terminal between (3) and (4), check continuity between (1) and (2).
If no continuity exists, replace the relay with a new one.

Pressure Switch (Triple Pressure Switch)

HVAC SYSTEM (HEATER, VENTILATOR AND A/C)

21. Pressure Switch (Triple Pressure Switch)

A: INSPECTION

- 1) Connect the manifold gauge to the service valve on the high-pressure side.
- 2) Remove the pressure switch harness connector. Using a circuit tester, inspect the ON-OFF operation of pressure switch.

	Terminal No.	Operation	Standard kPa (kg/cm ² , psi)
High and low pressure switch	1 and 2	Turns OFF.	Increasing to 3,140 ⁺⁵⁰ ₋₂₀₀ (32.02 ^{+0.51} _{-2.04} , 455.4 ^{+7.25} _{-29.0})
			Decreasing to 196±20 (2.00±0.20, 28.4±2.9)
		Turns ON.	Increasing to 225 ⁺²⁵ ₋₂₉ (2.29 ^{+0.25} _{-0.30} , 32.6 ^{+3.6} _{-4.2})
			Decreasing to 2,550±200 (26.00±2.04, 369.8±29.0)
Middle pressure switch	3 and 4	Turns OFF.	Decreasing to 1,370±120 (14±1, 199±14)
		Turns ON.	Increasing to 1,770±100 (18±1, 256±14)

Actuator

HVAC SYSTEM (HEATER, VENTILATOR AND A/C)

22. Actuator

A: REMOVAL

1. MODE DOOR ACTUATOR

Disconnect the connector, remove the screw, and then remove the mode door actuator from heater and cooling unit.

- Passenger's side

B: INSTALLATION

Install in the reverse order of removal.

2. INTAKE DOOR ACTUATOR

Disconnect the connector, remove the screw, and then remove the intake door actuator from blower motor unit.

3. AIR MIX DOOR ACTUATOR (AUTO A/C MODEL)

Disconnect the connector, remove the screw, and then remove the air mix door actuator from heater and cooling unit.

- Driver's side

23. Ambient Sensor (Auto A/C Model)

A: REMOVAL

- 1) Open the front hood.
- 2) Disconnect the ground cable from battery.
- 3) Disconnect the ambient sensor connector.
- 4) Remove the ambient sensor from the radiator lower panel.

B: INSTALLATION

Install in the reverse order of removal.

C: INSPECTION

<Ref. to AC(diag)-31, AMBIENT SENSOR, Diagnostic Procedure for Sensors.>

Sunload Sensor (Auto A/C Model)

HVAC SYSTEM (HEATER, VENTILATOR AND A/C)

24. Sunload Sensor (Auto A/C Model)

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Disconnect the connector and remove the sunload sensor.

CAUTION:

Be careful not to damage the interior trims when removing the sensor.

B: INSTALLATION

Install in the reverse order of removal.

C: INSPECTION

<Ref. to AC(diag)-37, SUNLOAD SENSOR, Diagnostic Procedure for Sensors.>

25. In-Vehicle Sensor (Auto A/C Model)

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Remove the console side panel of driver's side.
<Ref. to EI-54, REMOVAL, Center Console.>
- 3) Disconnect the connector and aspirator hose, remove the pawl and remove the in-vehicle sensor from center console frame.

CAUTION:

Be careful not to damage the sensors and interior trims when removing.

B: INSTALLATION

Install in the reverse order of removal.

C: INSPECTION

<Ref. to AC(diag)-33, IN-VEHICLE SENSOR, Diagnostic Procedure for Sensors.>

26. Air Vent Grille

A: REMOVAL

1. CENTER GRILLE

- 1) Disconnect the ground cable from battery.
- 2) Remove the three pawls and connector to remove center air vent grill.

2. SIDE GRILLE

Remove the two pawls to remove side air vent grill.

B: INSTALLATION

Install in the reverse order of removal.

C: INSPECTION

- 1) Check the direction and amount of air can be adjusted smoothly.
- 2) Check the adjustment can be kept in each position.

27.Heater Duct

A: REMOVAL

1. FRONT HEATER DUCT

- 1) Remove the instrument panel lower cover. <Ref. to EI-50, REMOVAL, Instrument Panel Lower Cover.>
- 2) Remove the screws and detach the front heater duct (A).

2. REAR HEATER DUCT

- 1) Remove the heater cooling unit. <Ref. to AC-37, REMOVAL, Heater and Cooling Unit.>
- 2) Remove the front seats. <Ref. to SE-9, REMOVAL, Front Seat.>
- 3) Remove the front side sill cover.
- 4) Pull off the floor mat to remove the rear center heater duct (A) and rear heater duct LH, RH (B).

B: INSTALLATION

Install in the reverse order of removal.

Heater Vent Duct

HVAC SYSTEM (HEATER, VENTILATOR AND A/C)

28.Heater Vent Duct

A: REMOVAL

- 1) Remove the instrument panel. <Ref. to EI-50, REMOVAL, Instrument Panel Lower Cover.>
- 2) Remove the screws and detach the center vent duct (A).
- 3) Remove the screws and detach the center vent ducts (B).
- 4) Remove the insulator, remove the screws and detach the defroster duct.

B: INSTALLATION

Install in the reverse order of removal.

29.A/C Filter

A: REPLACEMENT

1) Remove the instrument panel side cover.

2) Remove the clip and damper (string).

- (1) Clip
- (2) Damper

3) Remove the A/C filter.

4) Install in the reverse order of removal.

General Diagnostic Table

HVAC SYSTEM (HEATER, VENTILATOR AND A/C)

30. General Diagnostic Table

A: INSPECTION

Symptom		Repair order
Blower motor	Doesn't operate.	Fuse
		Blower motor relay
		Blower motor
		Blower motor resistor
		Blower switch
		Wire harness
	Noise	Blower motor
Compressor	Doesn't operate.	Refrigerant
		Fuse
		Air conditioning relay
		Magnet clutch
		Compressor
		Pressure switch
		A/C switch
		Blower switch
	Wire harness	
	Noise	V-Belt
		Magnet clutch
Compressor		
Cold air not emitted.	Refrigerant	
	V-Belt	
	Magnet clutch	
	Compressor	
	Pressure switch	
	A/C switch	
	Blower switch	
	Wire harness	
	Heater duct	
	Heater vent duct	
	Warm air not emitted.	Engine coolant
Blower switch		
Heater core		
Heater cock solenoid valve		
Temperature of air from vents does not change.	Engine coolant	
	Air mix door actuator (Auto A/C)	
	Wire harness (Auto A/C)	
	Temperature control cable (Manual A/C)	
Unable to switch blow vents.	Mode door actuator	
	Air flow switch	
	Wire harness	
Unable to switch suction vents.	Air inlet select switch	
	Intake door actuator	
	Wire harness	

Basic Diagnostic Procedure

HVAC SYSTEM (AUTO A/C) (DIAGNOSTICS)

1. Basic Diagnostic Procedure

A: PROCEDURE

Step	Check	Yes	No
1 START INSPECTIONS. 1) Perform the pre-inspection. <Ref. to AC(diag)-3, INSPECTION, General Description.> 2) Perform the self-diagnosis. <Ref. to AC(diag)-10, OPERATION, Diagnostic Chart for Self-Diagnosis.>	Does the self-diagnosis operate?	Go to step 2.	<Ref. to AC(diag)-15, A/C OR SELF-DIAGNOSIS SYSTEMS DO NOT OPERATE, Diagnostics for A/C System Malfunction.>
2 IDENTIFY MALFUNCTION PART. Identify the malfunction part with self-diagnosis.	Can the malfunction part be identified?	Repair the malfunction part in accordance with each diagnostic chart.	Go to step 3.
3 CHECK COMPARTMENT TEMPERATURE. 1) Turn ON the A/C switch. 2) Turn the temperature control dial at maximum cool position. 3) Check the compartment temperature change.	Does the compartment temperature change?	Go to step 4.	<Ref. to AC(diag)-20, COMPARTMENT TEMPERATURE DOES NOT CHANGE, OR A/C SYSTEM DOES NOT RESPOND PROMPTLY., Diagnostics for A/C System Malfunction.>
4 CHECK A/C SYSTEM RESPONSE. Change the temperature setting, and check the response of A/C system.	Does the A/C system respond quickly?	A/C system is normal.	<Ref. to AC(diag)-20, COMPARTMENT TEMPERATURE DOES NOT CHANGE, OR A/C SYSTEM DOES NOT RESPOND PROMPTLY., Diagnostics for A/C System Malfunction.>

General Description

HVAC SYSTEM (AUTO A/C) (DIAGNOSTICS)

2. General Description

A: CAUTION

- 1) Never connect the battery in reverse polarity.
 - Auto A/C control module may be destroyed instantly.
- 2) Do not disconnect the battery terminals while the engine is running.
 - A large counter electromotive force will be generated in the generator, and this voltage may damage electronic parts such as auto A/C control module, etc.
- 3) Before disconnecting the connectors of each sensor and the auto A/C control module, be sure to turn off the ignition switch.
 - Auto A/C control module may be damaged.
- 4) Every A/C-related part is a precision part. Do not drop them.
- 5) Airbag system wiring harness is routed near the A/C control panel and junction box.

CAUTION:

- For airbag system, yellow-colored wiring harness and connectors are all used. Do not use the electrical test equipment on these circuits.
- Be careful not to damage the airbag system wiring harness when servicing the A/C control panel and junction box.

B: INSPECTION

Before performing the diagnosis, check the following items which might affect A/C system problems.

1. BATTERY

- 1) Measure the battery voltage and specific gravity of electrolyte.

Standard voltage: 12 V

Specific gravity: More than 1.260

- 2) Check the condition of the fuses for A/C system power supply and other fuses.
- 3) Check the condition of harness and harness connector connections.

2. ASPIRATOR HOSE

- 1) Turn the ignition switch to ON, and press the A/C switch.
- 2) Turn the temperature control dial at maximum hot position.
- 3) Turn the air flow control dial to "DEF" position.
- 4) Turn the fan speed control dial to 4th position.
- 5) Approach a strip of paper in front of the in-vehicle sensor suction port (A) located in the driver's side console side panel, and check that air is being sucked into the port by seeing the paper moving towards the port.

NOTE:

Be careful not to let the paper get sucked into the port.

- 6) If the paper does not move at all, remove the driver's side console side panel <Ref. to EI-54, REMOVAL, Center Console.> and check for improper connection of the aspirator hose, in-vehicle sensor and heater unit, and repair them if necessary.

3. A/C LINE

Check the connection for A/C line (A) and lower side high-pressure pipe.

4. CONTROL LINKAGE

- 1) Check the state of mode door linkage.
- 2) Check the state of air mix door linkage.
- 3) Check the state of intake door linkage.

General Description

HVAC SYSTEM (AUTO A/C) (DIAGNOSTICS)

5. CONTROL SWITCHES

Start and warm-up the engine completely.

1) Inspection using switches

No.	Point to check	Switch operation	Judgment standard
1	OFF switch	Press the OFF switch.	Setting temperature display goes out. <ul style="list-style-type: none"> • Blower fan: OFF • Inlet opening: External air • Compressor: OFF
2	AUTO switch, Driver's side temperature control dial and passenger's side temperature control dial	1) Press the AUTO switch. 2) Turn the temperature control dial to the left fully, and set to 18°C (64°F) (maximum cool position).	AUTO display illuminates. <ul style="list-style-type: none"> • Outlet air temperature: COOL • Blower fan: HI (AUTO) • Outlet opening: FACE • Inlet opening: AUTO • Compressor: AUTO
		3) Turn the temperature control dial to the right slowly, and change the setting from 18°C (64°F) (maximum cool position) to 32°C (90°F).	<ul style="list-style-type: none"> • Outlet air temperature: COOL → HOT • Blower fan: AUTO • Outlet opening: FACE → B/L → FOOT • Inlet opening: AUTO • Compressor: AUTO
		4) Turn the temperature control dial to the right fully, and set to 32°C (90°F) (maximum hot position).	<ul style="list-style-type: none"> • Outlet air temperature: HOT • Blower fan: HI (AUTO) • Outlet opening: FOOT • Inlet opening: Ambient (AUTO) • Compressor: AUTO
3	Defroster switch	Press the defroster switch.	Defroster switch indicator illuminates. <ul style="list-style-type: none"> • Outlet air temperature: AUTO • Blower fan: AUTO • Outlet opening: DEF • Inlet opening: External air • Compressor: ON
4	FRESH/RECIRC switch	Press the FRESH/RECIRC switch.	Inlet opening switches RECIRC → FRESH or FRESH → RECIRC each time pressing the switch.
5	MODE switch	Press the MODE switch.	Outlet opening switches FACE → B/L → FOOT → F/D each time pressing the switch.
6	FAN switch	Press the FAN (+) switch.	Inlet opening switches LO → M1 → M2 → M3 → M4 → HI each time pressing the switch.

2) Compressor operation inspection

No.	Point to check	Switch operation	Judgment standard
1	Compressor	1) Turn the A/C switch to ON. 2) Set the FAN switch between LO and HI.	Compressor: ON

3) Inspection of illumination control

No.	Point to check	Switch operation	Judgment standard
1	Illumination	Turn the lighting switch to ON.	Illumination comes on.

| (4) Defroster switch | (8) Fan switch | |

NOTE:

For A/C system self-diagnosis, there is one that checks the control panel, and the other that checks the whole control system (sensor, actuator, blower motor, etc.). Perform the self-diagnosis for control panel first, and then perform the self-diagnosis for control system.

Diagnostic Chart for Self-Diagnosis

HVAC SYSTEM (AUTO A/C) (DIAGNOSTICS)

1. A/C CONTROL PANEL SELF-DIAGNOSIS

Step	Check	Yes	No
1 SET SELF-DIAGNOSIS MODE BY OPERATING A/C CONTROL PANEL. 1) Turn the ignition switch from OFF to ACC, and wait for 2 seconds. 2) Turn the ignition switch to ON with the AUDIO switch and SEEK UP switch pressed. 3) The screen display and indicator illuminate.	Does the self-diagnosis mode operate?	Go to step 2.	<Ref. to AC(diag)-15, A/C OR SELF-DIAGNOSIS SYSTEMS DO NOT OPERATE, Diagnostics for A/C System Malfunction.>
2 CHECK DISPLAY AND INDICATOR. Check if all the screen display and indicators come on and then go off. NOTE: "11" — "14" is displayed in the screen when malfunction occurs.	Do all the screen display and indicators come on and then go off?	Go to step 3.	Replace the A/C control panel.
3 CHECK SWITCH AND TEMPERATURE CONTROL DIAL INPUT. According to the switch check table, press each switch or turn the temperature control dial, and check the relative screen display and indicators illuminate. <Ref. to AC(diag)-12, SWITCH CHECK TABLE, OPERATION, Diagnostic Chart for Self-Diagnosis.>	Does the screen display related to each switch and dial input illuminate?	Go to step 4.	Replace the A/C control panel.
4 CHECK A/C CONTROL PANEL COMMUNICATION. 1) Turn the ignition switch to OFF. 2) Disconnect the auto A/C control module harness connector. 3) Using a suitable lead wire, short the terminal No. 15 and No. 16 of auto A/C control module harness connector (B283). 4) Turn the ignition switch from OFF to ACC, and wait for 2 seconds. 5) Turn the ignition switch to ON with the AUDIO switch and SEEK SOWN switch pressed. 6) When no malfunction occurs in the control panel communication, "CL" is displayed in the screen; and when malfunction occurs, "OP" is displayed.	Is "CL" displayed in the screen?	A/C control panel is normal. Turn the ignition switch to OFF, and connect the auto A/C control module harness connector.	Replace the A/C control panel.

Diagnostic Chart for Self-Diagnosis

HVAC SYSTEM (AUTO A/C) (DIAGNOSTICS)

2. SWITCH CHECK TABLE

AC-01166

Switch	Display screen	Switch	Display screen
A/C switch	(6)	FAN switch (+)	(4)
AUTO switch	(1)	FAN switch (-)	(3)
Air flow control switch	(9)	Driver's side temperature control dial	(10) (12)
FRESH/RECIRC	(13)	Passenger's side temperature control dial	(11) (12)
Defroster switch	(7)	OFF switch	(2) (5)
Rear defogger switch	(8)		

Diagnostic Chart for Self-Diagnosis

HVAC SYSTEM (AUTO A/C) (DIAGNOSTICS)

3. A/C CONTROL SYSTEM SELF-DIAGNOSIS

Step	Check	Yes	No
<p>1 SET SELF-DIAGNOSIS MODE BY OPERATING A/C CONTROL PANEL.</p> <p>1) Turn the ignition switch from OFF to ACC, and wait for 2 seconds.</p> <p>2) Start the engine with the auto switch and FRESH/RECIRC switch pressed.</p> <p>NOTE: Self-diagnosis can also be performed with ignition switch ON, but start the engine because telling the magnet clutch operation is difficult.</p> <p>3) All the indicator blinks four times.</p>	Does the self-diagnosis mode operate?	Go to step 2.	<Ref. to AC(diag)-15, A/C OR SELF-DIAGNOSIS SYSTEMS DO NOT OPERATE, Diagnostics for A/C System Malfunction.>
<p>2 CHECK EACH SENSOR AND POTENTIOMETER</p> <p>1) After the indicators are completed to blink, automatically change to the inspection mode of sensor and potentiometer.</p> <p>NOTE: Display items can be changed each time the A/C switch is pressed. (Step Operation)</p> <p>2) When malfunction occurs in each sensor and potentiometer, codes are displayed on the screen. When no malfunction occurs in each sensor and potentiometer, code "20" is displayed on the screen.</p> <p>3) Identify the defective sensor according to the sensor check table. <Ref. to AC(diag)-14, SENSOR CHECK TABLE, OPERATION, Diagnostic Chart for Self-Diagnosis.></p>	Are other codes except "20" displayed?	Repair the defective sensor. <Ref. to AC(diag)-31, Diagnostic Procedure for Sensors.>	Go to step 3.
<p>3 CHECK EACH ACTUATOR, BLOWER FAN AND MAGNET CLUTCH.</p> <p>1) After completing each sensor and potentiometer inspection, change to the inspection mode of actuator, blower fan and magnet clutch by pressing the defroster switch.</p> <p>2) Each mode will change and operate automatically every four seconds.</p> <p>NOTE: Operation mode items can be changed each time the A/C switch is pressed. (Step Operation)</p> <p>3) Check the operation of actuator, blower fan and magnet clutch in each mode according to the operating mode table. <Ref. to AC(diag)-14, OPERATING MODE TABLE, OPERATION, Diagnostic Chart for Self-Diagnosis.></p>	Do the actuator, blower fan and magnet clutch operate along the operating mode table?	A/C control system is normal. Press the OFF switch and complete the self-diagnosis mode.	Repair the malfunction part in accordance with each diagnostic chart. <Ref. to AC(diag)-15, Diagnostics for A/C System Malfunction.> or <Ref. to AC(diag)-24, Diagnostic Procedure for Actuators.>

Diagnostic Chart for Self-Diagnosis

HVAC SYSTEM (AUTO A/C) (DIAGNOSTICS)

4. SENSOR CHECK TABLE

NOTE:

When the sunload sensor check is conducted indoors or in the shade, open circuit might be indicated. Always check the sunload sensor at the place where the sun shines directly on it.

Display screen (Malfunction at present) *1	SENSOR	Trouble contents
21/AUTO Blink	In-vehicle sensor	Open
-21/AUTO Blink		Short
22/AUTO Blink	Ambient sensor	Sensor trouble or communication malfunction
23/AUTO Blink	Evaporator sensor	Open
-23/AUTO Blink		Short
24/AUTO Blink	Engine coolant temperature sensor	Sensor trouble or communication malfunction
25 Blink	Sunload sensor	Open *2
-25/AUTO Blink		Short
26/AUTO Blink	Driver's side air mix door actuator potentiometer	COOL
27/AUTO Blink		HOT
-26/AUTO Blink	Passenger's side air mix door actuator potentiometer	COOL
-27/AUTO Blink		HOT
28/AUTO Blink	Mode door actuator potentiometer	FACE
29/AUTO Blink		DEF
20 Blink	When all conditions are normal	

*1: "AUTO" display does not blink when past malfunction occurred. Past malfunction means that abnormal signal had input for a certain time continuously in the past.

*2: Present malfunction only is displayed for sunload sensor open circuit.

5. OPERATING MODE TABLE

Display screen	FRESH/RECIRC door	Mode door	Air mix door*	Blower fan	A/C compressor (Magnet clutch)
31	FRESH	FACE	Maximum cool	LO	OFF
32	RECIRC	FACE	Maximum cool	LO	ON
33	RECIRC	FACE	Maximum cool	M1	ON
34	FRESH	B/L	50%	M1	ON
35	FRESH	FOOT	50%	M1	ON
36	FRESH	FOOT	Maximum hot	M3	ON
37	FRESH	F/D	Maximum hot	M3	ON
38	FRESH	DEF	Maximum hot	HI	ON

*: Same opening angle for both driver's and passenger's side.

Diagnostics for A/C System Malfunction

HVAC SYSTEM (AUTO A/C) (DIAGNOSTICS)

Step	Check	Yes	No
1 CHECK FUSE. 1) Turn the ignition switch to OFF. 2) Remove the fuse No. 8 from main fuse box. 3) Check the condition of fuse.	Is the fuse blown-out?	Replace the fuse.	Go to step 2.
2 CHECK FUSE. 1) Turn the ignition switch to OFF. 2) Remove the fuse No. 22 and 31 from fuse & relay box. 3) Check the condition of fuse.	Is the fuse blown-out?	Replace the fuse.	Go to step 3.
3 CHECK A/C CONTROL PANEL POWER CIRCUIT. Measure the voltage between A/C control panel harness connector terminal and chassis ground after turning the ignition switch to ON position. <i>Connector & terminal</i> <i>(i88) No. 1 (+) — Chassis ground (-):</i>	Is the voltage more than 10 V?	Go to step 4.	Check the harness for open or short circuit between A/C control panel and fuse.
4 CHECK A/C CONTROL PANEL GROUND POWER CIRCUIT. Measure the resistance in harness between A/C control panel and chassis ground after turning the ignition switch to OFF position. <i>Connector & terminal</i> <i>(i88) No. 5 — Chassis ground:</i>	Is the resistance less than 10 Ω ?	Go to step 5.	Repair the harness for ground line.
5 CHECK AUTO A/C CONTROL MODULE POWER CIRCUIT. Measure the voltage between auto A/C control module connector terminal and chassis ground after turning the ignition switch to OFF position. <i>Connector & terminal</i> <i>(B282) No. 1 (+) — Chassis ground (-):</i>	Is the voltage more than 10 V?	Go to step 6.	Check the harness for open or short circuit between auto A/C control module and fuse.
6 CHECK AUTO A/C CONTROL MODULE POWER CIRCUIT. Measure the voltage between auto A/C control module connector terminal and chassis ground after turning the ignition switch to ACC position. <i>Connector & terminal</i> <i>(B282) No. 2 (+) — Chassis ground (-):</i>	Is the voltage more than 10 V?	Go to step 7.	Check the harness for open or short circuit between auto A/C control module and fuse.
7 CHECK AUTO A/C CONTROL MODULE POWER CIRCUIT. Measure the voltage between auto A/C control module connector terminal and chassis ground after turning the ignition switch to ON position. <i>Connector & terminal</i> <i>(B282) No. 9 (+) — Chassis ground (-):</i>	Is the voltage more than 10 V?	Go to step 8.	Check the harness for open or short circuit between auto A/C control module and fuse.
8 CHECK AUTO A/C CONTROL MODULE GROUND CIRCUIT. Measure the resistance in harness between auto A/C control module and chassis ground. <i>Connector & terminal</i> <i>(B282) No. 14, No. 16 — Chassis ground:</i>	Is the resistance less than 5 Ω ?	Go to step 9.	Repair the harness for ground line.
9 CHECK COMMUNICATION CIRCUIT. Measure the resistance in harness between A/C control panel and auto A/C control module. <i>Connector & terminal</i> <i>(i88) No. 3 — (B283) No. 16:</i> <i>(i88) No. 7 — (B283) No. 15:</i>	Is the resistance less than 1 Ω ?	Go to step 10.	Repair the harness.

Diagnostics for A/C System Malfunction

HVAC SYSTEM (AUTO A/C) (DIAGNOSTICS)

Step	Check	Yes	No
10 CHECK POOR CONTACT. Check poor contact in auto A/C control module connector.	Is there poor contact in connector?	Repair the connector.	Replace the auto A/C control module.

Diagnostics for A/C System Malfunction

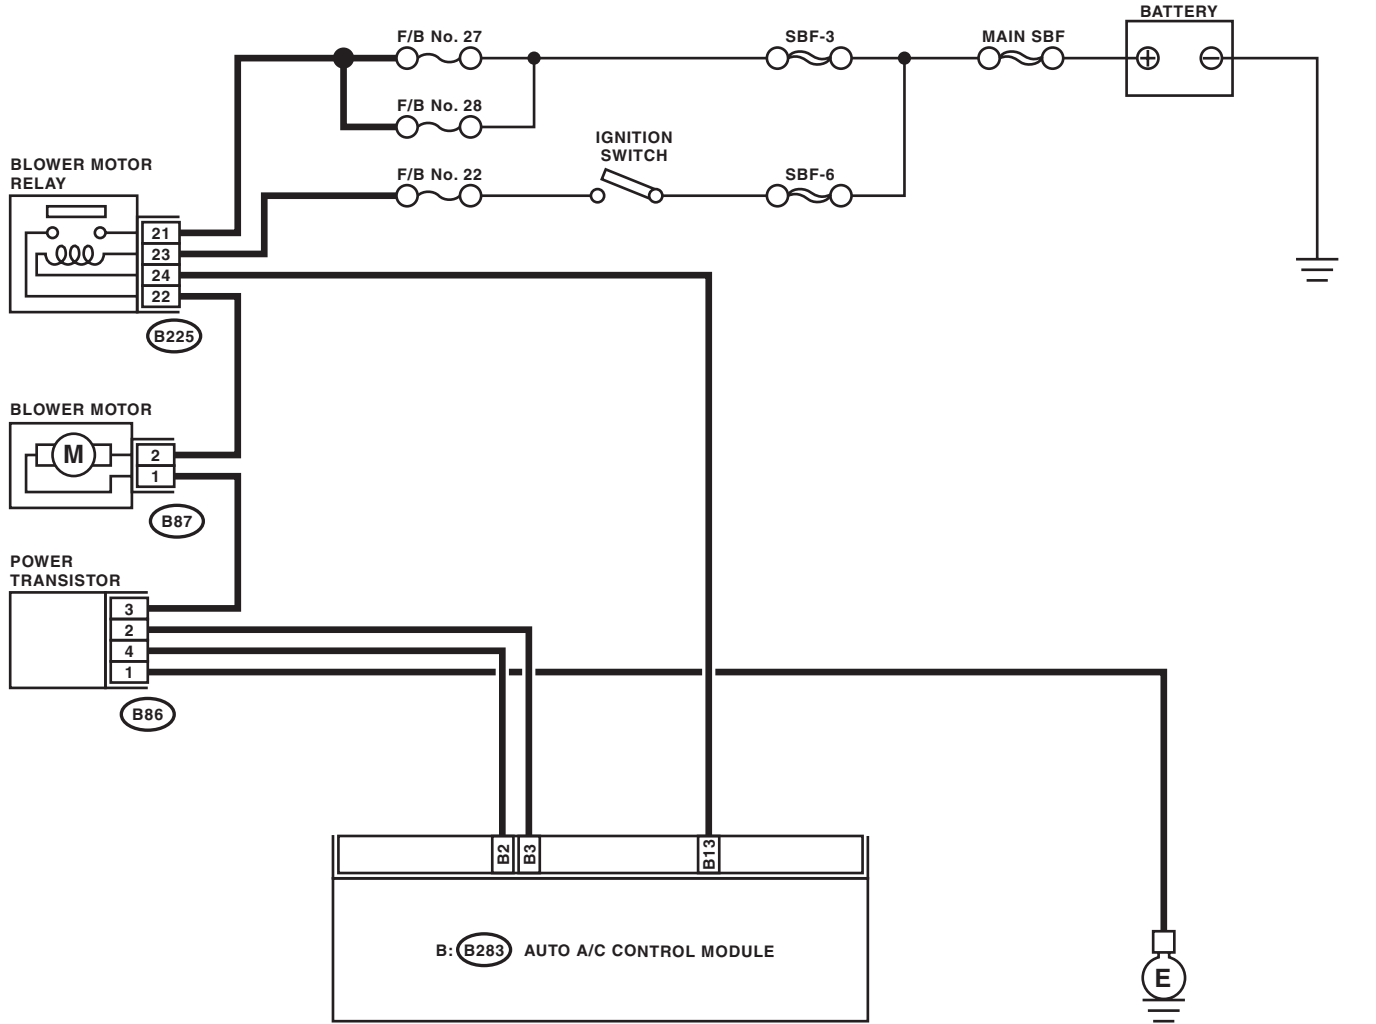

HVAC SYSTEM (AUTO A/C) (DIAGNOSTICS)

B: BLOWER FAN DOES NOT ROTATE.

TROUBLE SYMPTOM:

- Blower motor does not rotate.
- Blower motor does not rotate in "HI".

WIRING DIAGRAM:

B87

B86

B225

B: B283

AC-01168

Diagnostics for A/C System Malfunction

HVAC SYSTEM (AUTO A/C) (DIAGNOSTICS)

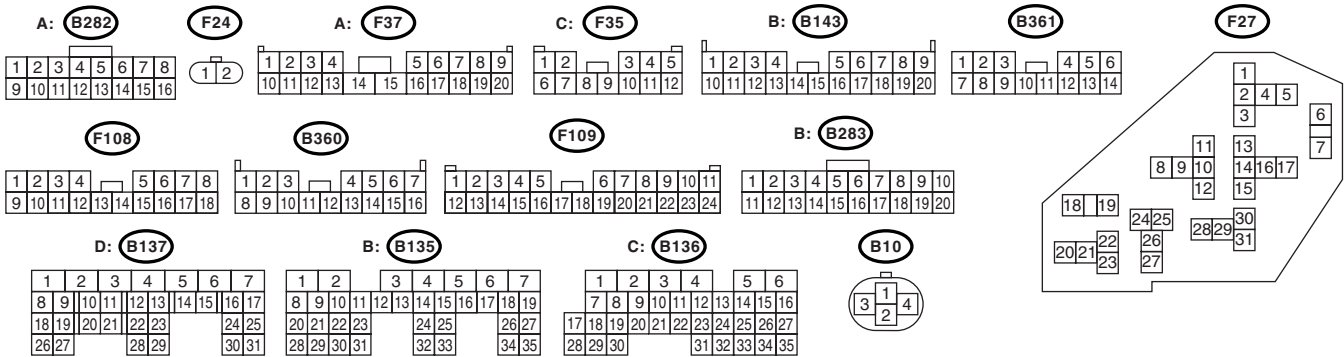

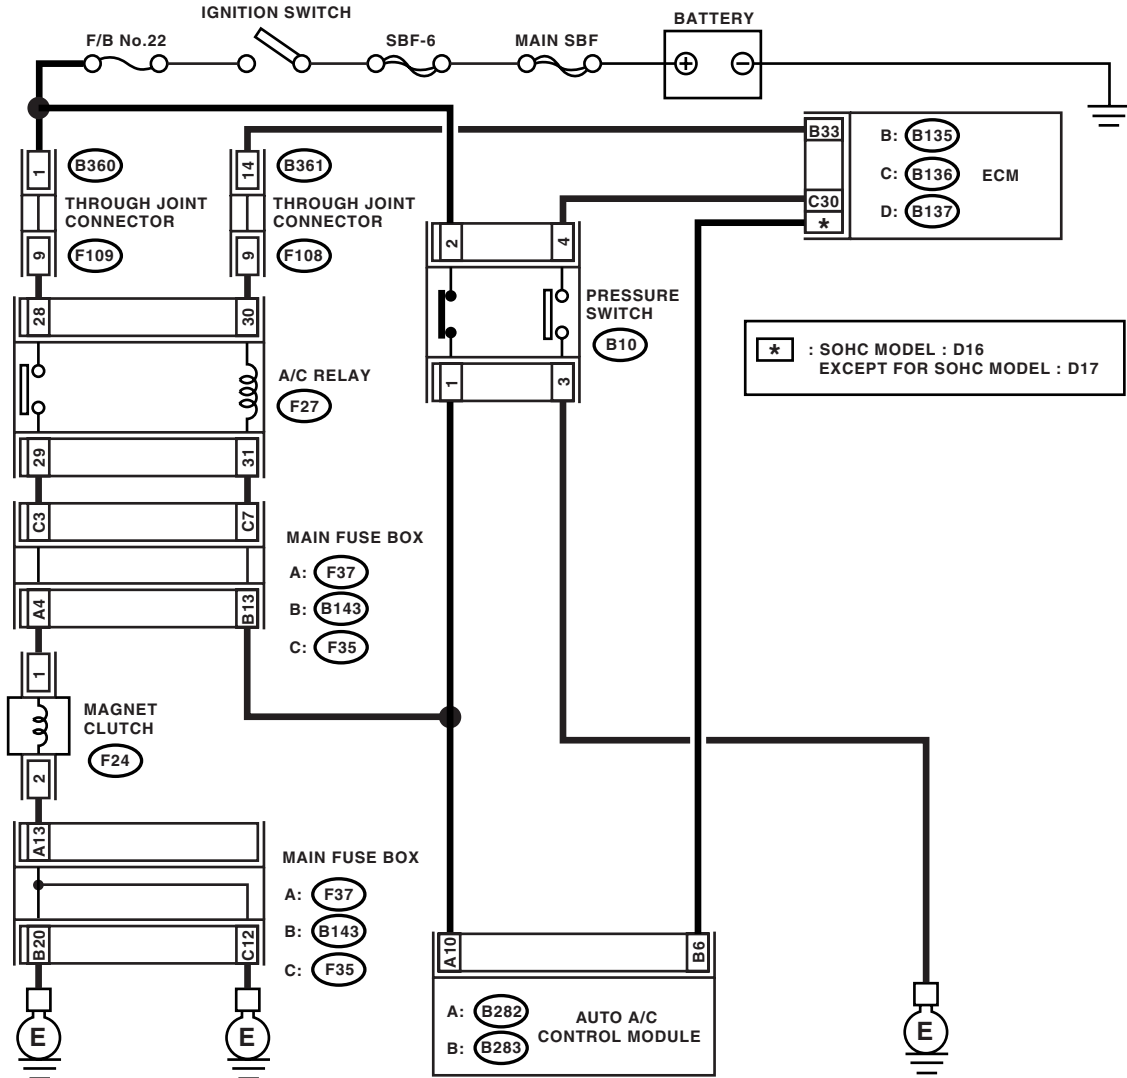

Step	Check	Yes	No
1 CHECK FUSE. 1) Remove the fuse No. 22, 27 and 28 from fuse & relay box. 2) Check the condition of fuse.	Is any fuse blown-out?	Replace the fuse.	Go to step 2.
2 CHECK POWER SUPPLY FOR BLOWER MOTOR. 1) Turn the ignition switch to ON. 2) Turn the blower switch to ON. 3) Measure the voltage between blower motor and chassis ground. Connector & terminal (B87) No. 2 (+) — Chassis ground (-):	Is the voltage more than 10 V?	Go to step 3.	Repair the open circuit of blower motor power supply line harness.
3 CHECK BLOWER MOTOR RELAY. 1) Turn the ignition switch to OFF. 2) Remove the blower motor relay. 3) Connect the battery positive (+) terminal to terminal No. 23 of blower motor relay, and negative (-) terminal to terminal No. 24. 4) Measure the resistance between terminals No. 21 and 22. Terminals (B225) No. 21 — (B225) No. 22:	Is the resistance less than 1 Ω ?	Go to step 4.	Replace the blower motor relay.
4 CHECK BLOWER MOTOR. 1) Disconnect the connector from blower motor. 2) Connect the battery positive (+) terminal to terminal No. 2 of blower motor connector, and negative (-) terminal to terminal No. 1. 3) Make sure the blower motor runs.	Does the blower motor run?	Go to step 5.	Replace the blower motor.
5 CHECK POOR CONTACT. Check poor contact in auto A/C control module connector.	Is there poor contact in connector?	Repair the connector.	Replace the auto A/C control module.

Diagnostics for A/C System Malfunction

HVAC SYSTEM (AUTO A/C) (DIAGNOSTICS)

C: COMPARTMENT TEMPERATURE DOES NOT CHANGE, OR A/C SYSTEM DOES NOT RESPOND PROMPTLY.

WIRING DIAGRAM:

AC-01254

Diagnostics for A/C System Malfunction

HVAC SYSTEM (AUTO A/C) (DIAGNOSTICS)

Step	Check	Yes	No
1 CHECK FUSE. 1) Turn the ignition switch to OFF. 2) Remove the fuse No. 22 from fuse & relay box. 3) Check the condition of fuse.	Is the fuse blown-out?	Replace the fuse.	Go to step 2.
2 CHECK SIGNAL TO A/C RELAY AND A/C CONTROL MODULE. 1) Disconnect the A/C relay and auto A/C control module harness connector. 2) Turn the ignition switch to ON. 3) Measure the voltage between A/C relay connector terminal and chassis ground. 4) Measure the voltage between auto A/C control module harness connector terminal and chassis ground. Connector & terminal (F27) No. 31 (+) — Chassis ground (-): (B282) No. 10 (+) — Chassis ground (-):	Is the voltage more than 10 V?	Go to step 5.	Go to step 3.
3 CHECK POWER SUPPLY FOR PRESSURE SWITCH. 1) Turn the ignition switch to OFF. 2) Disconnect the pressure switch harness connector. 3) Turn the ignition switch to ON. 4) Measure the voltage between pressure switch harness connector terminal and chassis ground. Connector & terminal (B10) No. 2 (+) — Chassis ground (-):	Is the voltage more than 10 V?	Go to step 4.	Check the harness for open or short circuit between fuse and pressure switch.
4 CHECK HARNESS BETWEEN PRESSURE SWITCH AND A/C RELAY, AUTO A/C CONTROL MODULE. 1) Turn the ignition switch to OFF. 2) Measure the resistance in harness between pressure switch connector and A/C relay connector. 3) Measure the resistance in harness between pressure switch connector and auto A/C control module connector. Connector & terminal (B10) No. 1 — (F27) No. 31: (B10) No. 1 — (B282) No. 10:	Is the resistance less than 1 Ω ?	Check the pressure switch. <Ref. to AC-41, INSPECTION, Pressure Switch (Triple Pressure Switch).>	Repair the harness.
5 CHECK POWER SUPPLY FOR A/C RELAY. Measure the voltage between A/C relay connector terminal and chassis ground. Connector & terminal (F27) No. 28 (+) — Chassis ground (-):	Is the voltage more than 10 V?	Go to step 6.	Check the harness for open or short circuit between fuse and A/C relay.
6 CHECK A/C RELAY. Check the A/C relay. <Ref. to AC-40, INSPECTION, Relay and Fuse.>	Is malfunction found in A/C relay?	Replace the A/C relay.	Go to step 7.

Diagnostics for A/C System Malfunction

HVAC SYSTEM (AUTO A/C) (DIAGNOSTICS)

Step	Check	Yes	No
<p>7 CHECK A/C ON SIGNAL.</p> <ol style="list-style-type: none"> 1) Turn the ignition switch to OFF. 2) Connect the A/C relay and all disconnected connectors. 3) Start the engine and turn the AUTO switch to ON. 4) Turn the temperature control dial at maximum cool position. 5) Measure the voltage between auto A/C control module harness connector terminal and chassis ground. <p>Connector & terminal (B283) No. 6 (+) — Chassis ground (-):</p>	Is the voltage more than 5.5 V?	Go to step 9.	Go to step 8.
<p>8 CHECK HARNESS BETWEEN AUTO A/C CONTROL MODULE AND ECM.</p> <ol style="list-style-type: none"> 1) Turn the ignition switch to OFF. 2) Disconnect the harness connector of auto A/C control module and ECM. 3) Measure the resistance in harness between auto A/C control module connector and ECM connector. <p>Connector & terminal Except for 2.5 L Non-turbo model (B283) No. 6 — (B137) No. 17: 2.5 L Non-turbo model (B283) No. 6 — (B137) No. 16:</p>	Is the resistance less than 1 Ω ?	Replace the auto A/C control module.	Repair the harness.
<p>9 CHECK MAGNET CLUTCH ON SIGNAL.</p> <ol style="list-style-type: none"> 1) Stop the engine and turn the AUTO switch to OFF. 2) Turn the ignition switch to ON. 3) Measure the voltage between ECM connector terminal and chassis ground. <p>Connector & terminal (B135) No. 33 (+) — Chassis ground (-):</p>	Is the voltage more than 10 V?	Go to step 10.	Check the harness for open or short circuit between A/C relay and ECM.
<p>10 CHECK MAGNET CLUTCH ON SIGNAL.</p> <ol style="list-style-type: none"> 1) Start the engine and turn the AUTO switch to ON. 2) Turn the temperature control dial at maximum cool position. 3) Measure the voltage between ECM connector terminal and chassis ground. <p>Connector & terminal (B135) No. 33 (+) — Chassis ground (-):</p>	Is the voltage 0 V?	Go to step 11.	Replace the ECM.
<p>11 CHECK POWER SUPPLY FOR MAGNET CLUTCH.</p> <ol style="list-style-type: none"> 1) Stop the engine and turn the AUTO switch to OFF. 2) Disconnect the harness connector of magnet clutch. 3) Start the engine and turn the AUTO switch to ON. 4) Turn the temperature control dial at maximum cool position. 5) Measure the voltage between magnet clutch harness connector terminal and chassis ground. <p>Connector & terminal (F24) No. 1 (+) — Chassis ground (-):</p>	Is the voltage more than 10 V?	Go to step 12.	Check the harness for open or short circuit between A/C relay and magnet clutch.

Diagnostics for A/C System Malfunction

HVAC SYSTEM (AUTO A/C) (DIAGNOSTICS)

Step	Check	Yes	No
12 CHECK HARNESS BETWEEN AUTO A/C CONTROL MODULE AND ECM. 1) Stop the engine and turn the AUTO switch to OFF. 2) Measure the resistance between magnet clutch harness connector terminal and chassis ground. Connector & terminal (F24) No. 2 — Chassis ground:	Is the resistance less than 1 Ω ?	Check the compressor. <Ref. to AC-34, INSPECTION, Compressor.>	Repair the harness.

Diagnostic Procedure for Actuators

HVAC SYSTEM (AUTO A/C) (DIAGNOSTICS)

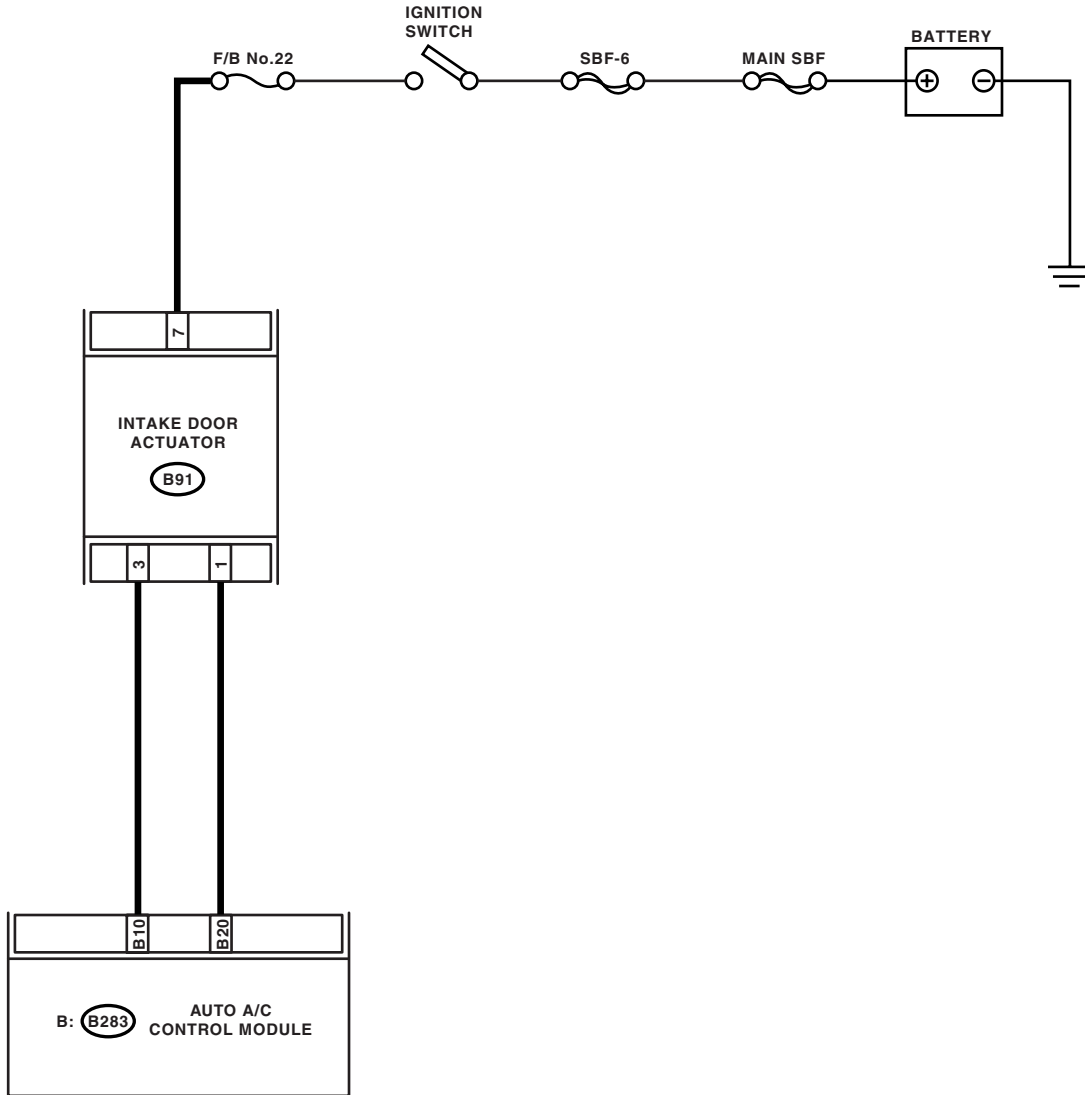

7. Diagnostic Procedure for Actuators

A: INTAKE DOOR ACTUATOR

TROUBLE SYMPTOM:

FRESH/RECIRC mode is not changed.

B: MODE DOOR ACTUATOR

TROUBLE SYMPTOM:

Air flow outlet is not changed.

WIRING DIAGRAM:

AC-00827

Diagnostic Procedure for Actuators

HVAC SYSTEM (AUTO A/C) (DIAGNOSTICS)

Step	Check	Yes	No
<p>1</p> <p>CHECK POWER SUPPLY FOR MODE DOOR ACTUATOR POSITION SENSOR.</p> <p>1) Turn the ignition switch to OFF. 2) Disconnect the mode door actuator connector. 3) Turn the ignition switch and AUTO switch to ON. 4) Measure the voltage between auto A/C control module connector terminals.</p> <p>Connector & terminal (B282) No. 8 (+) — (B282) No. 15 (-):</p>	Is the voltage approx. 5 V?	Go to step 2.	Replace the auto A/C control module.
<p>2</p> <p>CHECK POWER SUPPLY FOR MODE DOOR ACTUATOR.</p> <p>Measure the voltage between auto A/C control module connector and chassis ground after turning the air flow control switch to FACE position.</p> <p>Connector & terminal (B283) No. 7 (+) — Chassis ground (-):</p>	Is the voltage 7 V (at normal temperature)?	Go to step 3.	Replace the auto A/C control module.
<p>3</p> <p>CHECK POWER SUPPLY FOR MODE DOOR ACTUATOR.</p> <p>Measure the voltage between auto A/C control module connector and chassis ground after turning the air flow control switch to DEF position.</p> <p>Connector & terminal (B283) No. 17 (+) — Chassis ground (-):</p>	Is the voltage 7 V (at normal temperature)?	Go to step 4.	Replace the auto A/C control module.
<p>4</p> <p>CHECK HARNESS BETWEEN AUTO A/C CONTROL MODULE AND MODE DOOR ACTUATOR.</p> <p>1) Turn the A/C and ignition switch to OFF. 2) Disconnect the auto A/C control module connector. 3) Measure the resistance between auto A/C control module and mode door actuator connector.</p> <p>Connector & terminal (B77) No. 1 — (B282) No. 15: (B77) No. 2 — (B282) No. 8: (B77) No. 3 — (B282) No. 3: (B77) No. 4 — (B283) No. 17: (B77) No. 5 — (B283) No. 7:</p>	Is the resistance less than 1 Ω ?	Go to step 5.	Repair the harness between auto A/C control module and mode door actuator.
<p>5</p> <p>CHECK MODE DOOR ACTUATOR POSITION SWITCH SIGNAL.</p> <p>1) Connect the connector of auto A/C control module and mode door actuator. 2) Turn the ignition switch and AUTO switch to ON. 3) Check the voltage between auto A/C control module connector terminals while changing the mode between DEF and FACE.</p> <p>Connector & terminal (B282) No. 3 (+) — (B282) No. 15 (-):</p>	Does the voltage change between 1 (DEF) — 4 (FACE) V?	Go to step 6.	Replace the mode door actuator.
<p>6</p> <p>CHECK POOR CONTACT.</p> <p>Check poor contact in auto A/C control module and connector.</p>	Is there poor contact in connector?	Repair connector.	Replace the auto A/C control module.

Diagnostic Procedure for Actuators

HVAC SYSTEM (AUTO A/C) (DIAGNOSTICS)

C: AIR MIX DOOR ACTUATOR

TROUBLE SYMPTOM:

Outlet air temperature does not change.

WIRING DIAGRAM:

Diagnostic Procedure for Actuators

HVAC SYSTEM (AUTO A/C) (DIAGNOSTICS)

Step	Check	Yes	No
<p>1</p> <p>CHECK POWER SUPPLY FOR AIR MIX DOOR ACTUATOR POSITION SWITCH.</p> <p>1) Turn the ignition switch to OFF. 2) Disconnect the air mix door actuator connector. 3) Turn the ignition switch and AUTO switch to ON. 4) Measure the voltage between auto A/C control module connector terminals.</p> <p>Connector & terminal (B282) No. 8 (+) — (B282) No. 15 (-):</p>	Is the voltage approx. 5 V?	Go to step 2.	Replace the auto A/C control module.
<p>2</p> <p>CHECK POWER SUPPLY FOR AIR MIX DOOR ACTUATOR.</p> <p>Measure the voltage between auto A/C control module connector and chassis ground after turning the temperature control dial to maximum COOL position.</p> <p>Connector & terminal Driver's side (B283) No. 9 (+) — Chassis ground (-): Passenger's side (B283) No. 8 (+) — Chassis ground (-):</p>	Is the voltage 7 V (at normal temperature)?	Go to step 3.	Replace the auto A/C control module.
<p>3</p> <p>CHECK POWER SUPPLY FOR AIR MIX DOOR ACTUATOR.</p> <p>Measure the voltage between auto A/C control module connector and chassis ground after turning the temperature control dial to maximum HOT position.</p> <p>Connector & terminal Driver's side (B283) No. 19 (+) — Chassis ground (-): Passenger's side (B283) No. 18 (+) — Chassis ground (-):</p>	Is the voltage 7 V (at normal temperature)?	Go to step 4.	Replace the auto A/C control module.
<p>4</p> <p>CHECK HARNESS BETWEEN AUTO A/C CONTROL MODULE AND AIR MIX DOOR ACTUATOR.</p> <p>1) Turn the A/C and ignition switch to OFF. 2) Disconnect the auto A/C control module connector. 3) Measure the resistance between auto A/C control module and air mix door actuator connector.</p> <p>Connector & terminal Driver's side (B390) No. 1 — (B282) No. 15: (B390) No. 3 — (B282) No. 8: (B390) No. 5 — (B282) No. 12: (B390) No. 6 — (B283) No. 19: (B390) No. 7 — (B283) No. 9: Passenger's side (B235) No. 1 — (B282) No. 8: (B235) No. 3 — (B282) No. 15: (B235) No. 5 — (B282) No. 4: (B235) No. 6 — (B283) No. 8: (B235) No. 7 — (B283) No. 18:</p>	Is the resistance less than 1 Ω ?	Go to step 5.	Repair the harness between auto A/C control module and air mix door actuator.

Diagnostic Procedure for Actuators

HVAC SYSTEM (AUTO A/C) (DIAGNOSTICS)

Step	Check	Yes	No
5 CHECK AIR MIX DOOR ACTUATOR POSITION SWITCH SIGNAL. 1) Connect the connector of auto A/C control module and air mix door actuator. 2) Turn the ignition switch and AUTO switch to ON. 3) Check the voltage between auto A/C control module connector terminals while changing the setting temperature between maximum COOL and maximum HOT. Connector & terminal <i>Driver's side</i> (B282) No. 12 (+) — (B282) No. 15 (-): <i>Passenger's side</i> (B282) No. 4 (+) — (B282) No. 15 (-):	Does the voltage change between 1 (Max. HOT) — 4 (Max. COOL) V?	Go to step 6.	Replace the air mix door actuator.
6 CHECK POOR CONTACT. Check poor contact in auto A/C control module and connector.	Is there poor contact in connector?	Repair the connector.	Replace the auto A/C control module.

Diagnostic Procedure for Sensors

HVAC SYSTEM (AUTO A/C) (DIAGNOSTICS)

8. Diagnostic Procedure for Sensors

A: AMBIENT SENSOR

TROUBLE SYMPTOM:

Fan speed is not switched when the fan speed control dial is in AUTO position.

WIRING DIAGRAM:

AC-00829

Diagnostic Procedure for Sensors

HVAC SYSTEM (AUTO A/C) (DIAGNOSTICS)

Step	Check	Yes	No
1 CHECK AMBIENT SENSOR. 1) Turn the ignition switch to OFF. 2) Disconnect the connector from ambient sensor. 3) Measure the resistance between connector terminals of ambient sensor. <i>Terminals</i> <i>No. 1 — No. 2:</i>	Is the resistance approx. 2.2 k Ω at 25°C (77°F)?	Go to step 2.	Replace the ambient sensor.
2 CHECK INPUT SIGNAL FOR AMBIENT SENSOR. 1) Turn the ignition to ON. 2) Measure the voltage between connector (F78) terminals. <i>Connector & terminal</i> <i>(F78) No. 1 (+) — No. 2 (-):</i>	Is the voltage approx. 5 V?	Go to step 6.	Go to step 3.
3 CHECK OUTPUT SIGNAL OF BODY INTEGRATED UNIT. 1) Turn the ignition switch to OFF. 2) Draw out the body integrated unit. 3) Disconnect the connector from ambient sensor. 4) Turn the ignition switch to ON. 5) Measure the voltage between connector terminals of body integrated unit. <i>Connector & terminal</i> <i>(B281) No. 3 (+) — No. 10 (-):</i>	Is the voltage approx. 5 V?	Go to step 4.	Go to step 6.
4 CHECK HARNESS CONNECTOR BETWEEN BODY INTEGRATED UNIT AND AMBIENT SENSOR. 1) Turn the ignition switch to OFF. 2) Disconnect the connector from body integrated unit. 3) Measure the resistance in harness between body integrated unit and ambient sensor. <i>Connector & terminal</i> <i>(F78) No. 1 — (B281) No. 10:</i>	Is the resistance less than 1 Ω ?	Go to step 5.	Repair the open circuit in harness between body integrated unit and ambient sensor.
5 CHECK HARNESS CONNECTOR BETWEEN BODY INTEGRATED UNIT AND AMBIENT SENSOR. Measure the resistance in harness between body integrated unit and ambient sensor. <i>Connector & terminal</i> <i>(F78) No. 2 — (B281) No. 3:</i>	Is the resistance less than 1 Ω ?	Go to step 6.	Repair the open circuit in harness between body integrated unit and ambient sensor.
6 CHECK COMMUNICATION ERROR DISPLAY. 1) Connect the connectors of body integrated unit and ambient sensor to original position. 2) Check “Er xx” is indicated on the Odo/Trip meter in combination meter after turning the ignition switch to ON.	Is the error display “Er xx” indicated?	Check the communication circuit. <Ref. to LAN(diag)-2, Basic Diagnostic Procedure.>	Go to step 7.
7 CHECK POOR CONTACT. Check poor contact in auto A/C control module connector.	Is there poor contact in connector?	Repair the connector.	Replace the A/C control module.

Diagnostic Procedure for Sensors

HVAC SYSTEM (AUTO A/C) (DIAGNOSTICS)

B: IN-VEHICLE SENSOR

TROUBLE SYMPTOM:

Blower fan speed, outlet port and inlet port do not change after turning the AUTO switch to ON.

WIRING DIAGRAM:

I55

A: B282

B38

AC-00830

Diagnostic Procedure for Sensors

HVAC SYSTEM (AUTO A/C) (DIAGNOSTICS)

Step	Check	Yes	No
1 CHECK IN-VEHICLE SENSOR. 1) Turn the ignition switch to OFF. 2) Remove the driver's side lower cover. 3) Disconnect the connector from in-vehicle sensor. 4) Measure the resistance between connector terminals of in-vehicle sensor. <i>Terminals</i> <i>No. 1 — No. 2:</i>	Is the resistance approx. 2.7 k Ω at 20°C (68°F)?	Go to step 2.	Replace the in-vehicle sensor.
2 CHECK INPUT SIGNAL FOR IN-VEHICLE SENSOR. 1) Turn the ignition switch to ON. 2) Measure the voltage between in-vehicle sensor harness connector terminal and chassis ground. <i>Connector & terminal</i> <i>(i55) No. 2 (+) — No. 1 (-):</i>	Is the voltage approx. 5 V?	Go to step 6.	Go to step 3.
3 CHECK AUTO A/C CONTROL MODULE OUTPUT SIGNAL. 1) Turn the ignition switch to OFF. 2) Remove the auto A/C control module. 3) Turn the ignition switch to ON. 4) Measure the voltage between connector terminals of auto A/C control module. <i>Connector & terminal</i> <i>(B282) No. 5 (+) — (B282) No. 15 (-):</i>	Is the voltage approx. 5 V?	Go to step 4.	Go to step 6.
4 CHECK HARNESS BETWEEN AUTO A/C CONTROL MODULE AND IN-VEHICLE SENSOR. 1) Turn the ignition switch to OFF. 2) Disconnect the connector from auto A/C control module. 3) Measure the resistance in harness between auto A/C control module and in-vehicle sensor. <i>Connector & terminal</i> <i>(i55) No. 2 — (B282) No. 5:</i>	Is the resistance less than 1 Ω ?	Go to step 5.	Repair the harness between auto A/C control module and in-vehicle sensor.
5 CHECK HARNESS BETWEEN AUTO A/C CONTROL MODULE AND IN-VEHICLE SENSOR. Measure the resistance in harness between auto A/C control module and in-vehicle sensor. <i>Connector & terminal</i> <i>(i55) No. 1 — (B282) No. 15:</i>	Is the resistance less than 1 Ω ?	Go to step 6.	Repair the harness between auto A/C control module and in-vehicle sensor.
6 CHECK POOR CONTACT. Check poor contact in auto A/C control module connector.	Is there poor contact in connector?	Repair the connector.	Replace the auto A/C control module.

Diagnostic Procedure for Sensors

HVAC SYSTEM (AUTO A/C) (DIAGNOSTICS)

C: EVAPORATOR SENSOR

WIRING DIAGRAM:

B88

A: B282

AC-00831

Diagnostic Procedure for Sensors

HVAC SYSTEM (AUTO A/C) (DIAGNOSTICS)

Step	Check	Yes	No
1 CHECK EVAPORATOR SENSOR 1) Turn the ignition switch to OFF. 2) Remove the glove box. 3) Disconnect the connector from evaporator sensor. 4) Measure the resistance between connector terminals of evaporator sensor. <i>Terminals</i> <i>No. 1 — No. 2:</i>	Is the resistance approx. 3.3 k Ω at 20°C (68°F)?	Go to step 2.	Replace the evaporator sensor.
2 CHECK INPUT SIGNAL FOR EVAPORATOR SENSOR. 1) Turn the ignition switch to ON. 2) Measure the voltage between connector (B88) terminal and chassis ground. <i>Connector & terminal</i> <i>(B88) No. 1 (+) — No. 2 (-):</i>	Is the voltage approx. 5 V?	Go to step 6.	Go to step 3.
3 CHECK AUTO A/C CONTROL MODULE OUTPUT SIGNAL. 1) Turn the ignition switch to OFF. 2) Remove the auto A/C control module. 3) Turn the ignition switch to ON. 4) Measure the voltage between connector terminals of auto A/C control module. <i>Connector & terminal</i> <i>(B282) No. 13 (+) — No. 15 (-):</i>	Is the voltage approx. 5 V?	Go to step 4.	Go to step 6.
4 CHECK HARNESS CONNECTOR BETWEEN AUTO A/C CONTROL MODULE AND EVAPORATOR SENSOR. 1) Turn the ignition switch to OFF. 2) Disconnect the connector from auto A/C control module. 3) Measure the resistance in harness between auto A/C control module and evaporator sensor. <i>Connector & terminal</i> <i>(B88) No. 2 — (B282) No. 15:</i>	Is the resistance less than 1 Ω ?	Go to step 5.	Repair the open circuit in harness between auto A/C control module and evaporator sensor.
5 CHECK HARNESS CONNECTOR BETWEEN AUTO A/C CONTROL MODULE AND EVAPORATOR SENSOR. Measure the resistance in harness between auto A/C control module and evaporator sensor. <i>Connector & terminal</i> <i>(B88) No. 1 — (B282) No. 13:</i>	Is the resistance less than 1 Ω ?	Go to step 6.	Repair the open circuit in harness between auto A/C control module and evaporator sensor.
6 CHECK POOR CONTACT. Check poor contact in auto A/C control module connector.	Is there poor contact in connector?	Repair the connector.	Replace the auto A/C control module.

Diagnostic Procedure for Sensors

HVAC SYSTEM (AUTO A/C) (DIAGNOSTICS)

D: SUNLOAD SENSOR

TROUBLE SYMPTOM:

- Sensor identifies that sunlight is at maximum. Then, A/C system is controlled to COOL side.
- Sensor identifies that sunlight is at minimum. Then, A/C system is controlled to HOT side.

NOTE:

When the sunload sensor check is conducted indoors or in the shade, open circuit might be indicated. Always check the sunload sensor at the place where the sun shines directly on it.

WIRING DIAGRAM:

I51

A: B282

B38

Diagnostic Procedure for Sensors

HVAC SYSTEM (AUTO A/C) (DIAGNOSTICS)

Step	Check	Yes	No
1 CHECK POWER SUPPLY VOLTAGE FOR SUNLOAD SENSOR. 1) Turn the ignition switch to OFF. 2) Disconnect the connector from sunload sensor. 3) Turn the ignition switch to ON. 4) Measure the power supply voltage for sunload sensor. <i>Connector & terminal</i> <i>(i51) No. 1 (+) — No. 2 (-):</i>	Is the voltage approx. 5 V?	Go to step 4.	Go to step 2.
2 CHECK HARNESS CONNECTOR BETWEEN AUTO A/C CONTROL MODULE AND SUNLOAD SENSOR. 1) Turn the ignition switch to OFF. 2) Disconnect the connector from auto A/C control module. 3) Measure the resistance in harness between auto A/C control module and sunload sensor. <i>Connector & terminal</i> <i>(i51) No. 2 — (B282) No. 6:</i>	Is the resistance less than 1 Ω ?	Go to step 3.	Repair the harness between auto A/C control module and sunload sensor.
3 CHECK HARNESS CONNECTOR BETWEEN AUTO A/C CONTROL MODULE AND SUNLOAD SENSOR. Measure the resistance in harness between auto A/C control module and sunload sensor. <i>Connector & terminal</i> <i>(i51) No. 1 — (B282) No. 8:</i>	Is the resistance less than 1 Ω ?	Go to step 4.	Repair the harness between auto A/C control module and sunload sensor.
4 CHECK INPUT VOLTAGE FOR AUTO A/C CONTROL MODULE. 1) Connect the connectors of sunload sensor and auto A/C control module. 2) Turn the ignition switch to ON. 3) Measure the voltage between connector terminals of auto A/C control module. <i>Connector & terminal</i> <i>(B282) No. 8 (+) — (B282) No. 6 (-):</i>	Is the voltage approx. 2.5 V?	Go to step 5.	Replace the sunload sensor.
5 CHECK POOR CONTACT. Check poor contact in auto A/C control module connector.	Is there poor contact in connector?	Repair the connector.	Replace the auto A/C control module.

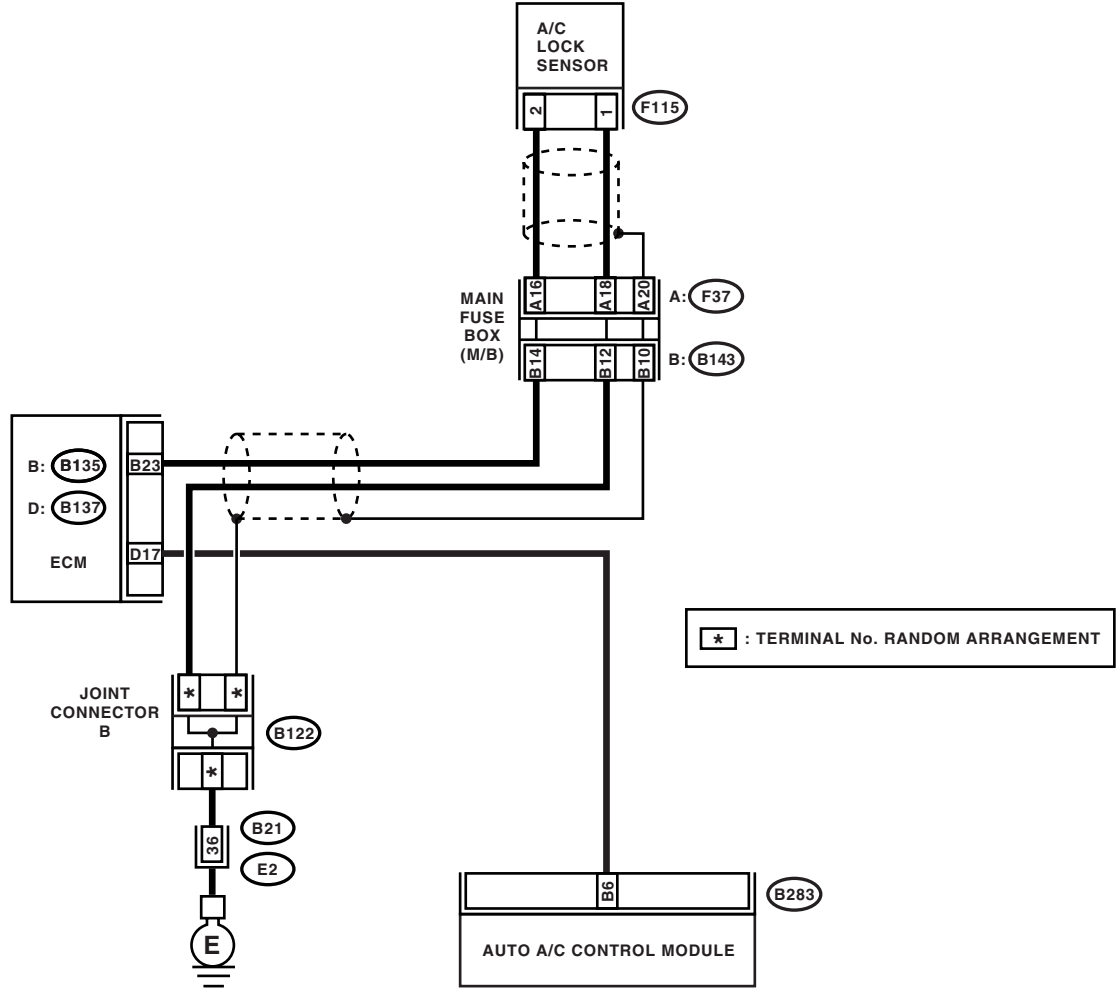

Diagnostic Procedure for Sensors

HVAC SYSTEM (AUTO A/C) (DIAGNOSTICS)

E: A/C LOCK SENSOR

- H6 model

WIRING DIAGRAM:

F115

B: B283

B: B143

A: F37

D: B137

B: B135

AC-01255

Diagnostic Procedure for Sensors

HVAC SYSTEM (AUTO A/C) (DIAGNOSTICS)

Step	Check	Yes	No
1 CHECK A/C LOCK SENSOR SIGNAL. 1) Turn the ignition switch to OFF. 2) Connect the Subaru Select Monitor to data link connector. 3) Start the engine and turn A/C to ON. 4) Read the data of A/C lock signal using Subaru Select Monitor. NOTE: • Subaru Select Monitor For detailed operation procedure, refer to "READ CURRENT DATA FOR ENGINE".<Ref. to EN(H4SO)(diag)-28, READ CURRENT DATA FOR ENGINE. (NORMAL MODE), OPERATION, Subaru Select Monitor.>	Is the A/C lock signal ON?	Go to step 4.	Go to step 2.
2 CHECK A/C LOCK SENSOR SIGNAL. 1) Start the engine and turn A/C to ON. 2) Measure the voltage between auto A/C control module connector and chassis ground. Connector & terminal (B283) No. 6 (+) — Chassis ground (-):	Is the voltage 7 — 14 V?	Replace the auto A/C control module.	Go to step 3.
3 CHECK OUTPUT OF ECM. Measure the voltage between ECM and chassis ground. Connector & terminal (D137) No. 17 (+) — Chassis ground (-):	Is the voltage 7 — 14 V?	Repair the harness between ECM and auto A/C control module.	Replace the ECM.
4 CHECK A/C LOCK SENSOR. 1) Turn the ignition switch to OFF. 2) Disconnect the ECM connector. 3) Measure the resistance between ECM connector and chassis ground. Connector & terminal (B135) No. 23 — Chassis ground:	Is the resistance 240 — 290 Ω ?	Replace the ECM.	Go to step 5.
5 CHECK A/C LOCK SENSOR. 1) Turn the ignition switch to OFF. 2) Disconnect the main fuse box connector. 3) Measure the resistance between main fuse box terminals. Connector & terminal (F37) No. 16 — No. 18:	Is the resistance 240 — 290 Ω ?	Go to step 7.	Go to step 6.
6 CHECK A/C LOCK SENSOR. 1) Turn the ignition switch to OFF. 2) Disconnect the A/C lock sensor connector. 3) Measure the resistance between A/C lock sensor terminals. Connector & terminal (F115) No. 1 — No. 2:	Is the resistance 240 — 290 Ω ?	Repair or replace the harness between A/C lock sensor and main fuse box.	Replace the A/C compressor assembly. (A/C lock switch is faulty.)
7 CHECK MAIN FUSE BOX. 1) Turn the ignition switch to OFF. 2) Disconnect the connector, and measure the resistance between main fuse box terminals. Connector & terminal (F37) No. 16 — (F143) No. 12: (F37) No. 18 — (F143) No. 14:	Is the resistance less than 10 Ω ?	Repair or replace the harness between A/C lock sensor and main fuse box.	Replace the main fuse box.

Diagnostics with Phenomenon

10. AIRBAG HARNESS

AB-00757

(1) Airbag main harness

(2) Airbag rear harness

B: CAUTION

- When servicing a vehicle, be sure to turn the ignition switch to OFF, disconnect the ground cable from battery, and wait for more than 20 seconds before starting work.
- The airbag system is fitted with a backup power source. If the airbag system is serviced within 20 seconds after the ground cable is disconnected, it may inflate.
- If the airbag warning light illuminates, repair the vehicle immediately. Airbag or pretensioner may inflate incorrectly, or not inflate in collision.
- If sensors, airbag module, airbag control module, pretensioner and harness are deformed or damaged, replace them with new parts.

- When checking the airbag system, be sure to use a digital circuit tester. Use of an analog circuit tester may cause the airbag to activate erroneously.

- When checking, use a test harness (1). Since damage to the connector terminal may cause the airbag to activate erroneously, do not directly apply the tester probe to any connector terminal of the airbag.

- Do not check continuity of the airbag modules for driver, passenger, side or curtain, or pretensioner.

General Description

AIRBAG SYSTEM

- Do not drop each airbag module, airbag control module and each sensor, subject them to high temperature over 93°C (199°F), or let water, oil or grease get on them; the internal parts may be damaged and reliability greatly lowered.

- If any damage, opening or rust is found on the airbag system wire harness, do not attempt to repair using soldering equipment. Be sure to replace the faulty harness with a new genuine part.

- Install the wire harness securely with the specified clips to avoid interference or tangled up with other parts.

- Do not allow water or oil to come in contact with the connector terminals. Do not touch the connector terminals.

- Either of the airbag modules for driver, passenger, side or curtain, or pretensioner must not be disassembled.

- The removed front seat with airbag module must be kept at least 200 mm (8 in) away from walls and other objects.

(1) 200 mm (8 in) or more

- Do not use the airbag or pretensioner parts from other vehicles. Always replace the defective parts with new parts.
- Never reuse a deployed airbag module and pretensioner.
- Do not discard the uninflated airbag or pretensioner.
- When painting or performing sheet metal work on the front part of the vehicle, including the front wheel apron front fender, and front side frame, remove the front sub sensors and wire harness of airbag system.

- When painting or performing sheet metal work on the side of the vehicle, including the side sill, center pillar, and front and rear doors, remove the side airbag sensors and wire harness of airbag system.

- After removal, keep each airbag system part with the pad facing upward on a dry, clean and flat surface away from heat, light sources, moisture and dust.

- When airbag control module, front sub sensor, side airbag sensor and curtain airbag sensor are removed, do not reuse the bolts and nuts of them. Always use new bolts and nuts for them.

General Description

AIRBAG SYSTEM

• When storing a removed airbag module, do not place any objects on it or pile airbag modules on top of each other. If the airbag inflates for some reason when it is placed with its pad side facing downward or under any object, a serious accident may result.

(1)

(2)

AB-00130

(1) Driver's airbag module

(2) Passenger's airbag module

C: PREPARATION TOOL

1. GENERAL TOOL

TOOL NAME	REMARKS
TORX® T30	Used for removing and installing driver's airbag module.

2. Airbag Connector

A: PROCEDURE

1. POWER SUPPLY, BUCKLE SWITCH AND OCCUPANT DETECTION SYSTEM HARNESS

1) How to disconnect:

- (1) Move the slide lock (A) in the direction of arrow.
- (2) With the slide lock (A) moved, separate the connector.

CAUTION:

When pulling the slide lock or disconnecting the connector, be sure to hold onto the connector and not the wire.

2) How to connect:

Holding the connector (A), push it in carefully until a connecting sound is heard.

CAUTION:

Be sure to insert the connector in until it is locked. Then pull on it gently to make sure that it is locked.

2. DRIVER'S AIRBAG MODULE AND PRE-TENSIONER

1) How to disconnect:

- (1) Using a flat tip screwdriver, pry the push lock upward to unlock.

- (2) Pull the connector to disconnect from the driver's airbag module assembly or retractor assembly.

2) How to connect:

Connect the connector in the reverse order of disconnecting. At this time, be sure to insert the push lock until a connecting sound is heard.

CAUTION:

- Be sure to insert the connector in until it is locked. Then pull on it gently to make sure that it is locked.
- Be sure to push the push lock in securely.

NOTE:

Connector can not be connected when the push lock is in lock position. To connect the connector, set the push lock to unlock position.

3. DRIVER'S AIRBAG (BETWEEN AIRBAG MAIN HARNESS AND ROLL CONNECTOR), PASSENGER'S AIRBAG

1) How to disconnect:

(1) Push the slide lock (A) into the direction of arrow.

(2) With the slide lock pushed, disconnect the connector.

CAUTION:
When pulling the side lock or disconnecting the connector, be sure to hold onto the connector and not the wire.

2) How to connect:

Holding the connector, push it in carefully until a connecting sound is heard.

CAUTION:
Be sure to insert the connector in until it is locked. Then pull on it gently to make sure that it is locked.

4. SIDE AIRBAG AND CURTAIN AIRBAG

1) How to disconnect:

(1) Push the lock arm (A).

(2) With the lock arm (A) pushed in, move the slide lock (B) in the direction of arrow.

(3) With the slide lock moved, release the lock arm (back to its original position), and disconnect the connector.

CAUTION:
When pulling the side lock or disconnecting the connector, be sure to hold onto the connector and not the wire.

2) How to connect:

Holding the connector, push it in carefully until a connecting sound is heard.

CAUTION:
Be sure to insert the connector in until it is locked. Then pull on it gently to make sure that it is locked.

5. FRONT SUB-SENSOR, SIDE AIRBAG SENSOR, CURTAIN AIRBAG SENSOR AND SEAT POSITION SENSOR

1) How to disconnect:

Holding the outer part (A), pull it in the direction of arrow.

CAUTION:

When pulling the side lock or disconnecting the connector, be sure to hold onto the connector and not the wire.

2) How to connect:

Holding the connector, push it in carefully until a connecting sound is heard.

CAUTION:

- The outer side (A) moves back, and so do not put your hand on the outer part.
- Be sure to insert the connector in until it is locked. Then pull on it gently to make sure that it is locked.

3. Inspection Locations After a Collision

A: REPLACEMENT

Replace the following parts when the airbag is deployed.

1. FRONT COLLISION

- 1) Driver's airbag module
- 2) Passenger's airbag module
- 3) Driver's seat belt (Pretensioner)
- 4) Passenger's seat belt (Pretensioner)
- 5) Airbag control module
- 6) Front sub sensor
- 7) Roll connector
- 8) Instrument panel (for integrating with passenger's airbag module)

2. SIDE COLLISION

- 1) Airbag control module
- 2) Side airbag module (operating side seat backrest)
- 3) Side airbag sensor (operating side)
- 4) Curtain airbag module (operating side)
- 5) Curtain airbag sensor (operating side)

3. INSPECTION OF OTHER PARTS

Check for the following, and replace the damaged parts with new parts.

- 1) Check the steering shaft for mounting conditions and deflection of front and rear, upward and downward directions, and deflection of front and rear direction with tilt lever released. (After collision, absorbing part of steering shaft may work.)
- 2) Check the connector of airbag module, pretensioner, etc. for damage, and also check each harness for pinch and connector damage. Replace the harness as a unit if damage is found.
- 3) Check the seat cushion frame, backrest, seat rail and headrest for deformation, distortion, crack, installing condition and play.
- 4) For passenger's seat, replace the seat cushion frame assembly with new one if the seat cushion frame or seat rail is deformed or cracked.
- 5) Perform the system calibration of passenger's seat. <Ref. to OD(diag)-12, SYSTEM CALIBRATION, OPERATION, Subaru Select Monitor.>
- 6) Check if the driver's seat position sensor and the driver's and passenger's seatbelt buckle switch operate normally.

B: INSPECTION

If the vehicle is involved in a collision on any side, even if it is a slight collision, be sure to check the following systems.

1. DRIVER'S AIRBAG MODULE

- 1) Check for the following, and replace the damaged parts with new parts.
 - Airbag module is cracked or deformed.
 - Harness and/or connector is cracked, deformed or open. Harness wire is exposed.
 - The module surface is fouled with grease, oil, water or cleaning solvent.
- 2) When installing a new driver's airbag module, check for the following, and replace the damaged parts with new parts.
 - The steering wheel is in the way, making it difficult to install the airbag module.
 - The clearance between the driver's airbag module and steering wheel is not constant.
 - When steering wheel deformation in axial, upward and downward directions exceed limits.

Standard value:

Height deflection A

Less than 6 mm (0.24 in)

O.D. deflection L

Less than 7 mm (0.28 in)

2. PASSENGER'S AIRBAG MODULE

Check for the following, and replace the damaged parts with new parts.

- Airbag module and instrument panel are cracked or deformed.
- Harness and/or connector is cracked, deformed or open. Harness wire is exposed.
- Mounting bracket is cracked or deformed.

3. SIDE AIRBAG MODULE

Check for the following, and replace the damaged parts with new parts.

- Front seat, airbag module and mounting bracket are damaged or deformed.
- Harness and/or connector is cracked, deformed or open. Harness wire is exposed.

Inspection Locations After a Collision

AIRBAG SYSTEM

4. CURTAIN AIRBAG MODULE

Check for the following, and replace the damaged parts with new parts.

- Airbag cover is scratched or broken.
- Harness and/or connector is cracked, deformed or open. Harness wire is exposed.
- Mounting bracket and securing clip are cracked or deformed.

5. AIRBAG CONTROL MODULE

Check for the following, and replace the damaged parts with new parts.

- Control module is cracked or deformed.
- Mounting bracket is cracked or deformed.
- Connector is scratched, cracked or deformed.
- Airbag is deployed.
- Side airbag is deployed.
- Curtain airbag is deployed.

6. FRONT SUB SENSOR

If the section of vehicle as shown in the figure is damaged, check for the following and replace the damaged parts with new parts.

- Front sub sensor is cracked or deformed.
- Mounting bracket is cracked or deformed.
- Connector is scratched, cracked or deformed.
- Airbag is deployed.

7. SIDE AIRBAG SENSOR AND CURTAIN AIRBAG SENSOR

If the section of vehicle as shown in the figure is damaged, check for the following and replace the damaged parts with new parts.

- Side airbag sensor and curtain airbag sensor are cracked or deformed.
- Mounting bracket is cracked or deformed.
- Connector is scratched, cracked or deformed.
- Side airbag or curtain airbag is deployed. (operating side)

8. ROLL CONNECTOR

Check for the following, and replace the damaged parts with new parts.

- Combination switch or steering roll connector is cracked or deformed.

9. STEERING SHAFT

Check for the following, and replace the damaged parts with new parts.

- Overall length of steering column should be within specifications.

Standard value:

Overall length L

Except for OUTBACK model

$833.6^{+1.3}_{-0.3}$ mm ($32.82^{+0.051}_{-0.012}$ in)

OUTBACK model

$825.4^{+1.3}_{-0.3}$ mm ($32.50^{+0.051}_{-0.012}$ in)

10. DRIVER'S SEAT

Check the following items and replace the faulty parts with new one.

- Seatbelt buckle switch or seat position sensor body/bracket is cracked or deformed.
- Harness and/or connector is cracked, deformed or open. Harness wire is exposed.

11. PASSENGER'S SEAT

1) Check the following items and replace the faulty parts with new one.

- Seatbelt buckle switch body/bracket for scratch, crack or deformation
- Backrest frame for crack or deformation
- Headrest for deformation or play

CAUTION:

Never disassemble the following items. Always check with seat cushion frame assembly.

- **Seat cushion frame and seat rail for crack or deformation**
- **Occupant detection system unit or each load sensor for scratch, crack or deformation**
- **Harness and/or connector is cracked, deformed or open. Harness wire is exposed.**

2) After checking the installing condition of passenger's seat, perform the system calibration of occupant detection system. <Ref. to OD(diag)-12, SYSTEM CALIBRATION, OPERATION, Subaru Select Monitor.>

4. Driver's Airbag Module

A: REMOVAL

CAUTION:

Refer to "CAUTION" of General Description before handling the airbag module. <Ref. to AB-5, CAUTION, General Description.>

- 1) Position the front wheels straight ahead. (After moving a vehicle more than 5 m (16 ft) with front wheels positioned straight ahead, make sure the vehicle moves straight ahead.)
- 2) Turn the ignition switch to OFF.
- 3) Disconnect the ground cable from battery and wait for at least 20 seconds before starting work.
- 4) Using TORX® BIT T30 (1), remove the two TORX® bolts on the side of steering wheel.

- 5) Disconnect the horn harness.
- 6) Disconnect the airbag connector on the back of airbag module, and then remove the airbag module. <Ref. to AB-10, PROCEDURE, Airbag Connector.>

- 7) Refer to "CAUTION" for handling of a removed airbag module. <Ref. to AB-5, CAUTION, General Description.>

B: INSTALLATION

CAUTION:

- Refer to "CAUTION" of General Description before handling the airbag module. <Ref. to AB-5, CAUTION, General Description.>
- To prevent the misconnection, the connector is colored. Connect the harness side connector to the same color of module side connector.

Install in the reverse order of removal.

Tightening torque:

10 N·m (1.0 kgf·m, 7.2 ft·lb)

C: INSPECTION

CAUTION:

Refer to "CAUTION" of General Description before handling the airbag module. <Ref. to AB-5, CAUTION, General Description.>

Check for the following, and replace damaged parts with new parts.

- Airbag module, harness, connector and mounting bracket are damaged. <Ref. to AB-13, DRIVER'S AIRBAG MODULE, INSPECTION, Inspection Locations After a Collision.>

5. Passenger's Airbag Module

A: REMOVAL

CAUTION:

Refer to “CAUTION” of “General Description” before handling the airbag module. <Ref. to AB-5, CAUTION, General Description.>

- 1) Turn the ignition switch to OFF.
- 2) Disconnect the ground cable from battery and wait for at least 20 seconds before starting work.
- 3) Remove the instrument panel. <Ref. to EI-56, INSTRUMENT PANEL (EXCLUDING STEERING SUPPORT BEAM), REMOVAL, Instrument Panel Assembly.>
- 4) Remove the pawl and remove the passenger's airbag module.

- 5) Refer to “CAUTION” for handling of a removed airbag module. <Ref. to AB-5, CAUTION, General Description.>

B: INSTALLATION

CAUTION:

Refer to “CAUTION” of General Description before handling the airbag module. <Ref. to AB-5, CAUTION, General Description.>

Install in the reverse order of removal.

Tightening torque:

7.4 N·m (0.75 kgf-m, 5.5 ft-lb)

C: INSPECTION

CAUTION:

Refer to “CAUTION” of General Description before handling the airbag module. <Ref. to AB-5, CAUTION, General Description.>

Check for the following, and replace damaged parts with new parts.

- Airbag module, harness, connector, and mounting bracket are damaged. <Ref. to AB-13, PASSENGER'S AIRBAG MODULE, INSPECTION, Inspection Locations After a Collision.>

6. Side Airbag Module

A: REMOVAL

CAUTION:

Refer to “CAUTION” of General Description before handling the airbag module. <Ref. to AB-5, CAUTION, General Description.>

NOTE:

Remove the passenger’s side by referring to driver’s side.

- 1) Turn the ignition switch to OFF.
- 2) Disconnect the ground cable from battery and wait for at least 20 seconds before starting work.
- 3) Remove the front seats. <Ref. to SE-9, REMOVAL, Front Seat.>
- 4) Remove the clip from reverse side of seat cushion assembly and slide rail IN (A), and then remove the side airbag harness.

- 5) Remove the backrest cover. <Ref. to SE-10, DISASSEMBLY, Front Seat.>
- 6) Remove the side airbag harness from backrest frame assembly.

- 7) Remove the side airbag module (A) from backrest frame assembly.

B: INSTALLATION

CAUTION:

- Refer to “CAUTION” of General Description before handling the airbag module. <Ref. to AB-5, CAUTION, General Description.>
- Be sure to perform the system calibration for occupant detection system after passenger’s seat installation. <Ref. to OD(diag)-12, SYSTEM CALIBRATION, OPERATION, Subaru Select Monitor.>

- 1) Ensure that there are no foreign articles on side airbag module.
- 2) Install the side airbag module (A) to backrest frame assembly.

Tightening torque:

6.0 N·m (0.61 kgf·m, 4.4 ft·lb)

- 3) Install the side airbag harness to backrest frame assembly.

NOTE:
Secure the harness to its original position of seat.

4) Install the backrest cover. <Ref. to SE-18, ASSEMBLY, Front Seat.>

5) Install the side airbag harness to slide rail IN (A), and then secure the connector to the bracket on back side of seat cushion assembly.

6) Recline the seat or slide it backward and forward, and check there is no contact between the seat backrest assembly, cushion cover assembly and side airbag harness.

C: INSPECTION

CAUTION:
Refer to “CAUTION” of General Description before handling the airbag module. <Ref. to AB-5, CAUTION, General Description.>

Perform the inspection of following items, and replace the damaged parts with new ones. <Ref. to AB-13, SIDE AIRBAG MODULE, INSPECTION, Inspection Locations After a Collision.>

1) With side collision (when side airbag is deployed)

- Side airbag module assembly
- Backrest pad assembly
- Backrest frame assembly
- Backrest cover assembly

2) Other replacement parts, which found to be damaged by visual check

- Headrest assembly
- Bushing
- Slide rail OUT (Driver’s side)
- Slide rail IN (Driver’s side)
- Seat cushion frame ASSY (Passenger’s side)
- Seat hinge cover
- Seat lifter lever
- Reclining lever
- Side airbag harness and connector on body side.

3) With side collision (when side airbag is not deployed)

Check the seat and airbag module visually, and then replace them with new ones if damaged or cracked.

Specially inspect the damage of airbag module body, mounting bracket, and harness connector.

4) Without side collision (dirt and damage of cover)
Replace the corresponding part with a new one.

7. Curtain Airbag Module

A: REMOVAL

CAUTION:

Refer to “CAUTION” of General Description before handling the airbag module. <Ref. to AB-5, CAUTION, General Description.>

- 1) Turn the ignition switch to OFF.
- 2) Disconnect the ground cable from battery and wait for at least 20 seconds before starting work.
- 3) Remove the rear quarter trim. (Sedan model) <Ref. to EI-62, SEDAN MODEL, REMOVAL, Rear Quarter Trim.>
- 4) Remove the quarter rear pillar trim. (Wagon model) <Ref. to EI-62, WAGON MODEL, REMOVAL, Rear Quarter Trim.>
- 5) Disconnect the curtain airbag module connector.

- Sedan model

- Wagon model

- 6) Remove the roof trim. <Ref. to EI-66, REMOVAL, Roof Trim.>
- 7) Remove the bolts (A) and clips (B), and then remove the curtain airbag module.

CAUTION:

- Be careful not to damage the curtain airbag module during removal.
- Never open the curtain airbag module before deploying it. Never reuse the opened curtain airbag module.

- Sedan model

- Wagon model

NOTE:

Remove the rear center seat belt retractor on the RH side before servicing.

- 8) Remove the airbag guide A from front pillar.

- 9) Remove the airbag guide B from center pillar.

- Sedan model

- Wagon model

10) Remove the airbag guide C from quarter pillar.

- Sedan model

- Wagon model

B: INSTALLATION

CAUTION:

- Refer to “CAUTION” of General Description before handling the airbag module. <Ref. to AB-5, CAUTION, General Description.>
- When installing the curtain airbag module, install a specified part at specified place.
- Be careful not to damage the curtain airbag module during installation.
- Never open the curtain airbag module before deploying it. Never reuse the deployed curtain airbag module.
- Ensure that there are no foreign articles on airbag module.

Install in the reverse order of removal.

Tightening torque:

7.5 N·m (0.77 kgf·m, 5.5 ft·lb)

C: INSPECTION

CAUTION:

Refer to “CAUTION” of General Description before handling the airbag module. <Ref. to AB-5, CAUTION, General Description.>

Perform the inspection of following items, and replace the damaged parts with new ones. <Ref. to AB-14, CURTAIN AIRBAG MODULE, INSPECTION, Inspection Locations After a Collision.>

1) With side collision (when curtain airbag is deployed)

- Curtain airbag module assembly
 - Roof trim
 - Front pillar upper trim
 - Center pillar upper trim
 - Rear quarter pillar trim
 - Airbag guide A, B, C
- 2) Other replacement parts, which found to be damaged by visual check
- Assist grip
 - Assist grip bracket
 - Curtain airbag harness and connector on body side.

3) With side collision (when curtain airbag is not deployed)

Check the roof trim, pillar trim and airbag module visually, and then replace them with new ones if damaged or cracked.

Specially inspect the damage of airbag module body, mounting bracket, harness connector.

4) Without side collision (dirt and damage of cover)
Replace the corresponding part with a new one.

8. Airbag Control Module

A: REMOVAL

CAUTION:

- Do not disassemble the airbag control module.
- If the airbag control module is deformed or if water damage is suspected, replace the airbag control module with a new one.
- Do not drop the airbag control module.
- After removal, keep the airbag control module on a dry, clean surface away from moisture, heat and dust.

- 1) Turn the ignition switch to OFF.
- 2) Disconnect the ground cable from battery and wait for at least 20 seconds before starting work.
- 3) Remove the console front panel and console side garnish. <Ref. to EI-54, REMOVAL, Center Console.>
- 4) Remove the screws and pull out the audio unit assembly to disconnect the connector for removal.

- 5) Disconnect the connector from airbag control module.
- 6) Remove the bolts and remove airbag control module.

B: INSTALLATION

CAUTION:

- Do not reuse the bolt and nut.
- Always use new bolts and nuts for them.
- Be sure to put the water protection cover over the connector.

Install in the reverse order of removal.

Tightening torque:

25 N·m (2.5 kgf-m, 18.1 ft-lb)

C: INSPECTION

Check for the following, and replace the damaged parts with new parts.

- Control module, connector, and mounting bracket are damaged.
- Airbag is deployed.
- Side airbag is deployed.
- Curtain airbag is deployed.

9. Side Airbag Sensor

A: REMOVAL

- 1) Turn the ignition switch to OFF.
- 2) Disconnect the ground cable from battery and wait for at least 20 seconds before starting work.
- 3) Remove the center pillar lower trim. <Ref. to EI-60, REMOVAL, Lower Inner Trim.>
- 4) Remove the center pillar inner protector lower.

- 5) Remove the front outer seat belt retractor. <Ref. to SB-10, OUTER SEAT BELT ASSEMBLY, REMOVAL, Front Seat Belt.>
- 6) Remove the nut and disconnect the airbag connector to remove side airbag sensor.

B: INSTALLATION

CAUTION:

- Do not reuse the bolt and nut.
- Always use new bolts and nuts for them.

Install in the reverse order of removal.

Tightening torque:

7.4 N·m (0.75 kgf-m, 5.5 ft-lb)

C: INSPECTION

Check for the following, and replace the damaged parts with new parts.

- Mounting bracket of airbag sensor or connector is damaged.
- Side airbag is deployed.

10. Curtain Airbag Sensor

A: REMOVAL

- 1) Turn the ignition switch to OFF.
- 2) Disconnect the ground cable from battery and wait for at least 20 seconds before starting work.
- 3) Remove the rear seat. <Ref. to SE-20, REMOVAL, Rear Seat.>
- 4) Detach the nuts and disconnect the airbag connector to remove the curtain airbag sensor.

B: INSTALLATION

CAUTION:

- Do not reuse the bolt and nut.
- Always use new bolts and nuts for them.

Install in the reverse order of removal.

Tightening torque:

7.4 N·m (0.75 kgf-m, 5.5 ft-lb)

C: INSPECTION

Check for the following, and replace the damaged parts with new parts.

- Mounting bracket of curtain airbag sensor or connector is damaged.
- Curtain airbag is deployed.

11.Roll Connector

A: REMOVAL

- 1) Turn the ignition switch to OFF.
- 2) Disconnect the ground cable from battery and wait for at least 20 seconds before starting work.
- 3) Remove the driver's airbag module. <Ref. to AB-16, REMOVAL, Driver's Airbag Module.>
- 4) Remove the steering wheel. <Ref. to PS-14, REMOVAL, Steering Wheel.>
- 5) Remove the steering column cover.
- 6) Remove the screws, and then remove the roll connector.

B: INSTALLATION

- 1) Install in the reverse order of removal.
- 2) Before installing steering wheel, be sure to adjust the direction of roll connector with steering. <Ref. to AB-25, ADJUSTMENT, Roll Connector.>

C: INSPECTION

Check for the following, and replace the damaged parts with new parts.

- Combination switch and roll connector are cracked or deformed.

D: ADJUSTMENT

- 1) Check that front wheels are positioned in straight ahead direction.
- 2) Turn the roll connector pins (A) clockwise until it stops.
- 3) Turn the roll connector pins (A) approx. 3.25 turns until "▲" marks are aligned.

12. Front Sub Sensor

A: REMOVAL

- 1) Turn the ignition switch to OFF.
- 2) Disconnect the ground cable from battery and wait for at least 20 seconds before starting work.
- 3) Remove the front bumper face. <Ref. to EI-30, FRONT BUMPER FACE, REMOVAL, Front Bumper.>
- 4) Remove the bolts, and then detach the front sub sensor.

- 5) Disconnect the connector from front sub sensor.

B: INSTALLATION

CAUTION:

- Do not reuse the bolt and nut.
- Always use new bolts and nuts for them.

Install in the reverse order of removal.

Tightening torque:

13 N·m (1.32 kgf-m, 9.6 ft-lb)

C: INSPECTION

Check for the following, and replace the damaged parts with new parts.

- Front sub sensor, mounting bracket and connector are damaged.
- Airbag is deployed.

Basic Diagnostic Procedure

AIRBAG SYSTEM (DIAGNOSTICS)

1. Basic Diagnostic Procedure

A: PROCEDURE

Step	Check	Yes	No
1 CHECK ILLUMINATION OF INDICATOR LIGHT. Check illumination of airbag warning light in the combination meter.	Does the airbag warning light illuminate?	Go to step 2.	Perform the diagnosis according to the phenomenon.
2 CHECK INDICATION OF DTC ON DISPLAY. 1) Turn the ignition switch to OFF. 2) Connect the Subaru Select Monitor to data link connector. 3) Turn the ignition switch to ON and the Subaru Select Monitor switch to ON. 4) Read DTC. <Ref. to AB(diag)-27, READ DIAGNOSTIC TROUBLE CODE (DTC), OPERATION, Subaru Select Monitor.> NOTE: If the communication function of Subaru Select Monitor cannot be executed normally, check the communication circuit. <Ref. to AB(diag)-29, COMMUNICATION FOR INITIALIZING IMPOSSIBLE, INSPECTION, Subaru Select Monitor.> 5) Record all the DTCs and freeze frame data.	Is DTC displayed?	Go to step 3.	Go to "Airbag Warning Light Failure". <Ref. to AB(diag)-36, Airbag Warning Light Failure.>
3 PERFORM DIAGNOSIS. 1) Judge the possible cause from "List of Diagnostic Trouble Code" <Ref. to AB(diag)-41, List of Diagnostic Trouble Code (DTC).> 2) Inspect the DTC using "List of Diagnostic Trouble Code (DTC)". 3) Repair the trouble cause. 4) Perform the clear memory mode. <Ref. to AB(diag)-34, Clear Memory Mode.> 5) Perform the inspection mode. <Ref. to AB(diag)-33, Inspection Mode.> 6) Read any DTC again.	Is DTC displayed?	Perform the procedure 1) to 5) in step 3.	Finish the diagnosis.

General Description

AIRBAG SYSTEM (DIAGNOSTICS)

3. General Description

A: CAUTION

- When servicing a vehicle, be sure to turn the ignition switch to OFF, disconnect the ground cable from battery, and wait for more than 20 seconds before starting work.
- The airbag system is equipped with a backup power source. If the airbag system is serviced within 20 seconds from the ground cable is disconnected, it may inflate.

- If sensors, airbag module, airbag control module, pretensioner and harness are deformed or damaged, replace them with new parts.

- Do not use the airbag system and pretensioners on other vehicles. When replacing parts, be sure to replace them with new ones.
- When checking the airbag system, be sure to use a digital circuit tester. Use of an analog circuit tester may cause the airbag to activate erroneously.

- When checking, use a test harness (1). Do not directly apply the tester probe to any connector terminal of the airbag.

- Do not drop each airbag system part, subject them to high temperature over 93°C (199°F), or let water, oil or grease get on them; the internal parts may be damaged and reliability is greatly lowered.

General Description

AIRBAG SYSTEM (DIAGNOSTICS)

- If any damage, opening or rust is found on the airbag system wire harness, do not attempt to repair using soldering equipment. Be sure to replace the faulty harness with a new genuine part.

- Install the wire harness securely with the specified clips to avoid interference or tangled up with other parts.

- Do not allow water or oil to come in contact with the connector terminals. Do not touch the connector terminals.

- Either of the airbag modules for driver, passenger, side or curtain, or pretensioner must not be disassembled.

- The airbag module cannot be used again if once deployed.
- After removal, keep the airbag module with the pad facing upward on a dry, clean and flat surface away from heat, light sources, moisture and dust.

- Do not check continuity of either of the airbag modules for driver, passenger, side or curtain, or pretensioner.

General Description

AIRBAG SYSTEM (DIAGNOSTICS)

- The removed front seat with an airbag module must be kept at least 200 mm (8 in) away from walls and other objects.

(1) 200 mm (8 in) or more

- When painting or performing sheet metal work on the front part of the vehicle, including the front wheel apron, front fender and front side frame, remove the front sub sensors and wire harness of the airbag system.
- When painting or performing sheet metal work on the side of the vehicle, including the side sill, center pillar and front and rear doors, remove the side airbag sensors and wire harness of the airbag system.

- Do not discard undeployed airbag modules. They could easily cause a serious accident if accidentally deployed.

General Description

AIRBAG SYSTEM (DIAGNOSTICS)

- When storing a removed airbag module, do not place any objects on it or pile airbag modules on top of each other. If the airbag inflates for some reason when it is placed with its pad side facing downward or under any object, a serious accident may result.

AB-00130

(1) Driver's airbag module

(2) Passenger's airbag module

General Description

AIRBAG SYSTEM (DIAGNOSTICS)

B: INSPECTION

Measure the battery voltage and check electrolyte.

Standard voltage: 12 V

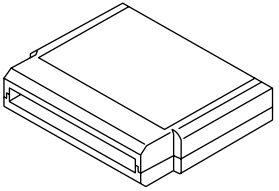

Specific gravity: Above 1.260

C: PREPARATION TOOL

CAUTION:

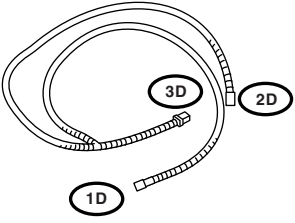

To check the voltage and resistance of airbag system component, be sure to use the specified test harness.

Airbag Connector

AIRBAG SYSTEM (DIAGNOSTICS)

5. Airbag Connector

A: PROCEDURE

1. BUCKLE SWITCH AND OCCUPANT DETECTION CONTROL MODULE

1) How to disconnect:

- (1) Move the slide lock (A) in the direction of arrow.
- (2) With the slide lock (A) moved, separate the connector.

CAUTION:

When pulling the slide lock or disconnecting the connector, be sure to hold onto the connector and not the wire.

2) How to connect:

Holding the connector (A), and push it in carefully until a connecting sound is heard.

CAUTION:

Be sure to insert the connector in until it locks. Then pull on it gently to make sure that it is locked.

2. DRIVER'S AIRBAG MODULE AND PRE-TENSIONER

1) How to disconnect:

- (1) Using a flat tip screwdriver, pry the push lock upward to unlock.

- (2) Pull the connector to disconnect from driver's side airbag module assembly or retractor assembly.

2) How to connect:

Connect the connector in the reverse order of disconnecting. At this time, be sure to insert the push lock until a connecting sound is heard.

CAUTION:

- Be sure to insert the connector in until it locks. Then pull it gently to make sure that it is locked.
- Be sure to push the push lock in securely.

NOTE:

Connector can not be connected when the push lock is in lock position. To connect the connector, set the push lock to unlock.

3. DRIVER'S AIRBAG (BETWEEN AIRBAG MAIN HARNESS AND ROLL CONNECTOR), PASSENGER'S AIRBAG

1) How to disconnect:

- (1) Push the slide lock (A) into the direction of arrow.

- (2) With the slide lock pushed, separate the connector.

CAUTION:

Be sure to hold onto the connector and not wire when pulling the slide lock or disconnecting the connector.

2) How to connect:

Holding the connector, push it in carefully until a connecting sound is heard.

CAUTION:

Be sure to insert the connector in until it locks. Then pull it gently to make sure that it is locked.

4. SIDE AIRBAG AND CURTAIN AIRBAG

1) How to disconnect:

- (1) Push the lock arm (A).
- (2) With the lock arm (A) pushed in, move the slide lock (B) in the direction of arrow.

- (3) With the slide lock moved, release the lock arm (back to its original position), and disconnect the connector.

CAUTION:

Be sure to hold onto the connector and not wire when pulling the slide lock or disconnecting the connector.

5. FRONT SUB SENSOR, SIDE AIRBAG SENSOR, CURTAIN AIRBAG SENSOR AND SEAT POSITION SENSOR LH

1) How to disconnect:

- Holding outer part (A), pull it in the direction of arrow.

Airbag Connector

AIRBAG SYSTEM (DIAGNOSTICS)

CAUTION:

Be sure to hold onto the connector and not wire when pulling the slide lock or disconnecting the connector.

2) How to connect:

Holding the connector, and push it in carefully until a connecting sound is heard.

CAUTION:

- Outer side (A) move back, and so do not put your hand on the outer part.
- Be sure to insert the connector in until it locks. Then pull it gently to make sure that it is locked.

6. Airbag Control Module I/O Signal

A: ELECTRICAL SPECIFICATION

AB-00937

- Terminal numbers of airbag control module connector are as shown in the figure.
- Airbag warning light illuminates when disconnecting the connector from airbag control module.

Item		Control module terminal No.
Data link connector		(1)-12
Combination meter		(1)-3
Battery power supply	Shared fuse	(1)-6
	Dedicated fuse	(1)-5
Passenger's air bag module 1st stage	+	(1)-10
	-	(1)-11
Passenger's air bag module 2nd stage	+	(1)-8
	-	(1)-7
Driver's air bag module 1st stage	+	(1)-14
	-	(1)-13
Driver's air bag module 2nd stage	+	(1)-16
	-	(1)-17

B: WIRING DIAGRAM

<Ref. to WI-120, WIRING DIAGRAM, Airbag System.>

7. Subaru Select Monitor

A: OPERATION

1. READ DIAGNOSTIC TROUBLE CODE (DTC)

When malfunction of airbag system occurs, the DTC stored in airbag control module will be read out.

1) Prepare the Subaru Select Monitor kit. <Ref. to AB(diag)-8, SPECIAL TOOL, PREPARATION TOOL, General Description.>

2) Connect the diagnosis cable to Subaru Select Monitor.

3) Insert the cartridge to Subaru Select Monitor. <Ref. to AB(diag)-8, SPECIAL TOOL, PREPARATION TOOL, General Description.>

4) Connect the Subaru Select Monitor to data link connector.

(1) Data link connector (1) is located in the lower portion of the instrument panel (on the driver's side).

(2) Connect the diagnosis cable to data link connector.

CAUTION:

Do not connect the scan tools except for Subaru Select Monitor.

5) Turn the ignition switch to ON (engine OFF) and turn the Subaru Select Monitor switch to ON.

(1) Power switch

6) On the «Main Menu» display screen, select the {Each System Check} and press the [YES] key.

7) On the «System Selection Menu» display screen, select the {Airbag System} and press the [YES] key.

8) Press the [YES] key after the {**MY AIRBAG SYSTEM} is displayed.

9) On the «Airbag system» display screen, select the {DTC Display} and press the [YES] key.

NOTE:

- For details concerning operation procedure, refer to the "SUBARU SELECT MONITOR OPERATION MANUAL".

- For details concerning DTCs, refer to the "List of Diagnostic Trouble Code (DTC)". <Ref. to AB(diag)-41, List of Diagnostic Trouble Code (DTC).>

Subaru Select Monitor

AIRBAG SYSTEM (DIAGNOSTICS)

2. READ STATUS DATA

Check the operating condition of each sensor in the event of malfunction in seat belt buckle switch and seat position sensor, or when the seat belt buckle switch and seat position has been replaced.

- 1) On the «Main Menu» display screen, select the {Each System Check} and press the [YES] key.
- 2) On the «System Selection Menu» display screen, select the {Airbag System} and press the [YES] key.
- 3) On the «Airbag System» display screen, select the {Status Data} and press the [YES] key.

A list of the support data is shown in the following table.

Item	Display
Seat position sensor LH	Front ^{*1} /Rear ^{*2} /Other ^{*3} /Unknown ^{*4} /___ ^{*5}
Seat position sensor RH	___ ^{*5}
Seat belt buckle switch LH	Belted ^{*6} /Unbelted ^{*7} /Other ^{*8} /Unknown ^{*4} /___ ^{*9}
Seat belt buckle switch RH	Belted ^{*6} /Unbelted ^{*7} /Other ^{*8} /Unknown ^{*4} /___ ^{*9}
Passenger's airbag status	ON ^{*10} /OFF ^{*11} /Unknown ^{*4}

*1: The seat position is forward.

*2: The seat position is the rear side.

*3: Data other than before and behind the seat of the breakdown etc, are input, it is displayed.

*4: It is displayed when it is initial.

*5: Seat position sensor uncorrespondance.

*6: Seat belt installation.

*7: Seat belt uninstallation.

*8: When the data of the seat belt installation and the uninstallation of the breakdown etc. is input, it is displayed.

*9: Seat belt buckle switch uncorrespondance.

*10: Passenger's seat air bag operating state.

*11: Passenger's seat air bag non-operating state.

NOTE:

For detailed operation procedure, refer to "SUBARU SELECT MONITOR OPERATION MANUAL".

3. CLEAR MEMORY MODE

Clear the DTC stored in the airbag control module after repairing airbag system. (If the memory isn't cleared after repairing malfunction, repaired DTC will be read out again when a new malfunction occurs.)

- 1) On the «Main Menu» display screen, select the {Each System Check} and press the [YES] key.
- 2) On the «System Selection Menu» display screen, select the {Airbag System} and press the [YES] key.
- 3) On the «Airbag System» display screen, select the {Memory Clear} and press the [YES] key.
- 4) Press the [YES] key after the "Clear memory?" has been displayed.
- 5) When the "Done" is shown on the display screen, turn the Subaru Select Monitor switch to OFF.

NOTE:

For detailed operation procedure, refer to "SUBARU SELECT MONITOR OPERATION MANUAL".

B: INSPECTION

1. COMMUNICATION FOR INITIALIZING IMPOSSIBLE

DETECTING CONDITION:

Defective harness connector

TROUBLE SYMPTOM:

Communication is impossible between Airbag control module and Subaru Select Monitor.

WIRING DIAGRAM:

Subaru Select Monitor

AIRBAG SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No	
1	CHECK IGNITION SWITCH.	Does the ignition switch turn to ON?	Go to step 2.	Turn the ignition switch to ON, and select Airbag mode using Subaru Select Monitor.
2	CHECK BATTERY. 1) Turn the ignition switch to OFF. 2) Measure the battery voltage.	Is the voltage more than 11 V?	Go to step 3.	Charge or replace the battery.
3	CHECK BATTERY TERMINAL.	Is there poor contact at battery terminal?	Repair or tighten the battery terminal.	Go to step 4.
4	CHECK SUBARU SELECT MONITOR COMMUNICATION. 1) Turn the ignition switch ON. 2) Using Subaru Select Monitor, check whether communication to other system can be executed normally.	Is the system name and model year displayed on Subaru Select Monitor?	Go to step 9.	Go to step 5.
5	CHECK CONNECTOR OF AIRBAG CONTROL MODULE. 1) Turn the ignition switch OFF. 2) Disconnect the connector (AB52) from seat position sensor (LH). 3) Connect the connector (2Y) in the test harness Y to connector (AB52). 4) Connect the battery ground cable, and turn the ignition switch ON.	Is the airbag control module connected securely?	Go to step 6.	Reconnect the airbag control module connector.
6	CHECK SUBARU SELECT MONITOR COMMUNICATION. 1) Turn the ignition switch to OFF. 2) Disconnect the airbag control module connector. 3) Turn the ignition switch to ON. 4) Check whether communication to other systems can be executed normally.	Is the system name and model year displayed on Subaru Select Monitor?	Replace the airbag control module. <Ref. to AB-22, Airbag Control Module.>	Go to step 7.
7	CHECK HARNESS CONNECTOR BETWEEN EACH CONTROL MODULE AND DATA LINK CONNECTOR. 1) Turn the ignition switch to OFF. 2) Disconnect airbag control module, ABSCM&H/U, ECM and TCM. 3) Measure the resistance between data link connector and chassis ground. Connector & terminal (B40) No. 10 — Chassis ground:	Is the resistance more than 1 MΩ?	Go to step 8.	Repair the harness and connector between each control module and data link connector. Airbag harness must be replaced with harness. Do not attempt to repair it.
8	CHECK OUTPUT SIGNAL FOR AIRBAG CONTROL MODULE. 1) Turn the ignition switch to ON in step 7 condition. 2) Measure the voltage between data link connector and chassis ground. Connector & terminal (B40) No. 10 (+) — Chassis ground (-):	Is the voltage less than 1 V?	Go to step 9.	Repair the harness and connector between each control module and data link connector.

Subaru Select Monitor

AIRBAG SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
9 CHECK HARNESS OF BETWEEN AIRBAG CONTROL MODULE AND DATA LINK CONNECTOR. 1) Turn the ignition switch OFF, disconnect the battery ground cable, and wait more than 20 seconds. 2) Disconnect the connector (AB6) from airbag control module. 3) Connect the connector (1U) in the test harness U to connector (AB6). 4) Measure the resistance between connector (4U) in the test harness U and data link connector. Connector & terminal (4U) No. 18 — (B40) No. 10:	Is the resistance less than 10 Ω ?	Go to step 10.	Repair the harness between airbag control module and data link connector. Or replace the airbag main harness with bulkhead harness.
10 CHECK POWER CIRCUIT. 1) Turn the ignition switch ON. 2) Measure the voltage between connector (2U) and chassis ground.	Is the voltage more than 10 V?	Go to step 11.	Repair the harness between airbag control module and battery. Or replace the airbag main harness with bulkhead harness.
11 CHECK BETWEEN AIRBAG CONTROL MODULE AND CHASSIS GROUND. 1) Turn the ignition switch OFF. 2) Measure the resistance between connector (2U) in the test harness U and chassis ground. Connector & terminal (2U) No. 10 — Chassis ground: (2U) No. 11 — Chassis ground:	Is the resistance less than 10 Ω ?	Go to step 12.	Repair the harness between airbag control module and chassis ground. Or replace the airbag main harness with bulkhead harness.
12 CHECK POOR CONTACT IN CONNECTOR.	Is there poor contact in control module power supply, ground circuit and data link connector?	Repair the connector.	Replace the airbag control module only. <Ref. to AB-22, REMOVAL, Airbag Control Module.>

2. WITHOUT DTC

DETECTING CONDITION:

- Defective combination meter
- Open in harness

TROUBLE SYMPTOM:

- Airbag warning light does not go off.
- “NO TROUBLE CODE” will be displayed on the Subaru Select Monitor.

NOTE:

- For detailed operation procedure, refer to “Airbag Warning Light Failure”. <Ref. to AB(diag)-36, Airbag Warning Light Failure.>
- When the Airbag warning light is OFF and “NO TROUBLE CODE” is displayed on Subaru Select Monitor, the system is in normal condition.

Read Diagnostic Trouble Code (DTC)

AIRBAG SYSTEM (DIAGNOSTICS)

8. Read Diagnostic Trouble Code (DTC)

A: OPERATION

For details about reading of DTCs, refer to “Subaru Select Monitor”. <Ref. to AB(diag)-27, Subaru Select Monitor.>

9. Inspection Mode

A: PROCEDURE

Recreate the circumstance by referring to the conditions described in the checklist.

10. Clear Memory Mode

A: OPERATION

Clear the memory in the following steps after the malfunction is repaired.

For details concerning DTC clear operation, refer to "Subaru Select Monitor". <Ref. to AB(diag)-27, Subaru Select Monitor.>

11. Airbag Warning Light Illumination Pattern

A: INSPECTION

Keep the ignition switch ON, and confirm that the airbag warning light remains off approx. 6 seconds after being turned on.

- (1) Airbag warning light
- (2) Approx. 6 sec.
- (3) Ignition switch (ON)

12. Airbag Warning Light Failure

A: AIRBAG WARNING LIGHT REMAINS ON DETECTING CONDITION:

- Airbag warning light failure
- Airbag control module to airbag warning light circuit is shorted or open.
- Grounding circuit is faulty.
- Airbag control module is faulty.
- (AB1) and (B31) are not connected properly.
- (AB6) is not connected properly to airbag control module.

CAUTION:

- **Before diagnosing the airbag system, be sure to turn the ignition switch OFF, disconnect the ground terminal from the battery, and wait more than 20 seconds before starting to work.**
- **Before replacing the airbag module, seat belt pretensioner, roll connector, control module and sensor, reconnect each part and confirm that the warning light operates properly.**
- **When inspecting the airbag main harness, disconnect the airbag module connector and the seat belt pretensioner of the driver's and passenger's seats for safety reasons.**

Airbag Warning Light Failure

AIRBAG SYSTEM (DIAGNOSTICS)

WIRING DIAGRAM:

AB-00936

Step	Check	Yes	No
1 READ DTC. Read the DTC. <Ref. to AB(diag)-27, READ DIAGNOSTIC TROUBLE CODE (DTC), OPERATION, Subaru Select Monitor.>	Is DTC displayed?	Perform the diagnosis according to DTC.	Go to step 2.
2 CHECK POOR CONTACT. 1) Turn the ignition switch OFF, disconnect the battery ground cable, and wait more than 20 seconds. 2) Confirm that the firm contact is secured between the airbag control module and connector (AB6).	Is there poor contact in connector (AB6)?	When the poor contact in connector is inrepairable, replace the airbag main harness with body harness or replace the airbag control module. <Ref. to AB-22, Airbag Control Module.>	Go to step 3.

Airbag Warning Light Failure

AIRBAG SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
3 CHECK AIRBAG MAIN HARNESS. 1) Remove the instrument panel lower cover and disconnect the connector (AB7) and (AB2). 2) Remove the instrument panel side cover of passenger side and disconnect the connector (AB10) and (AB9). 3) Disconnect the connector (AB6) from airbag control module, and connect the connector (1U) in the test harness U. 4) Connect the battery ground cable and turn the ignition switch ON. 5) Connect the connectors (7U) and (8U) in the test harness U. NOTE: After problem has been eliminated, disconnect the connectors (7U) and (8U).	Does the airbag warning light go off?	Go to step 4.	Go to step 5.
4 CHECK GROUND CIRCUIT. 1) Turn the ignition switch OFF, disconnect the battery ground cable, and wait more than 20 seconds. 2) Disconnect the connector (AB6) from airbag control module. 3) Connect the connector (1U) in the test harness U to body harness connector (AB6). 4) Measure the resistance between connector (2U) in the test harness U and chassis ground. Connector & terminal (2U) No. 10 — Chassis ground: (2U) No. 11 — Chassis ground:	Is the resistance less than 10 Ω ?	Replace the airbag control module. <Ref. to AB-22, Airbag Control Module.>	Repair the chassis ground circuit.
5 CHECK AIRBAG MAIN HARNESS AND BULKHEAD HARNESS. 1) Disconnect the connector (7U) and (8U). 2) Remove the combination meter. 3) Measure the resistance between connector (i10) and connector (2U) in the test harness U. Connector & terminal (2U) No. 7 — (i10) No. 13:	Is the resistance less than 10 Ω ?	Check the combination meter.	Go to step 6.
6 CHECK POOR CONTACT IN CONNECTORS (AB1) AND (B31). 1) Turn the ignition switch OFF, disconnect the battery ground cable, and wait more than 20 seconds. 2) Confirm that firm contact is secured between connectors (AB1) and (B31).	Is there poor contact in connectors (AB1) and (B31)?	Repair the bulkhead harness or replace the airbag main harness with body harness.	Go to step 7.
7 CHECK AIRBAG MAIN HARNESS. Check the airbag main harness for abnormalities.	Is anything unusual to airbag main harness?	Replace the airbag main harness with bulkhead harness.	Repair the bulkhead harness.

Airbag Warning Light Failure

AIRBAG SYSTEM (DIAGNOSTICS)

B: AIRBAG WARNING LIGHT REMAINS OFF

DETECTING CONDITION:

- Fuse No. 5 (in fuse box) is blown.
- Body harness circuit is open.
- Airbag warning light is faulty.
- Airbag main harness is faulty.
- Airbag control module is faulty.

CAUTION:

- Before diagnosing the airbag system, be sure to turn the ignition switch OFF, disconnect the ground terminal from battery, and wait more than 20 seconds before starting to work.
- Before replacing the airbag module, seat belt pretensioner, roll connector, control module and sensor, reconnect each part and confirm that the warning light operates properly.
- When inspecting the airbag main harness, disconnect the airbag module connector and the seat belt pretensioner of the driver's and passenger's seats for safety reasons.

WIRING DIAGRAM:

AB-00936

Airbag Warning Light Failure

AIRBAG SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
1 CHECK COMBINATION METER. Turn the ignition switch to ON, and confirm that warning lights equipped in the combination meter are turned on.	Do warning lights other than the airbag turn on?	Go to step 2 .	Check the combination meter.
2 CHECK DTC. Read the DTC. <Ref. to AB(diag)-27, READ DIAGNOSTIC TROUBLE CODE (DTC), OPERATION, Subaru Select Monitor.>	Is DTC displayed?	Perform the diagnosis according to DTC.	Go to step 3 .
3 CHECK FUSE NO. 5 (IN MAIN FUSE BOX). Remove the fuse No. 5 and perform visual inspection.	Is the fuse No. 5 (in main fuse box) blown out?	Replace the fuse No. 5. If the fuse No. 5 is blown again, go to step 4.	Go to step 4 .
4 CHECK AIRBAG WARNING LIGHT CIRCUIT (IN COMBINATION METER). 1) Turn the ignition switch OFF, disconnect the battery ground cable, and wait more than 20 seconds. 2) Disconnect the connector (AB1) from (B31). 3) Connect the battery ground cable and turn the ignition switch ON.	Does the airbag warning light turn on?	Go to step 5 .	Check the combination meter.
5 CHECK AIRBAG MAIN HARNESS. 1) Turn the ignition switch OFF, disconnect the battery ground cable, and wait more than 20 seconds. 2) Connect the connector (AB1) to (B31). 3) Disconnect the connector (AB6) from airbag control module. 4) Connect the battery ground cable and turn the ignition switch ON.	Does the airbag warning light turn on?	Replace the airbag control module. <Ref. to AB-22, Airbag Control Module.>	Replace the airbag main harness with bulkhead harness.

List of Diagnostic Trouble Code (DTC)

Diagnostic Chart with Trouble Code

AIRBAG SYSTEM (DIAGNOSTICS)

14. Diagnostic Chart with Trouble Code

A: DTC 11 DRIVER'S AIRBAG FAILURE

DTC DETECTING CONDITION:

- Airbag main harness circuit is open, shorted or shorted to ground.
- Airbag module harness (Driver's side) circuit is open, shorted or shorted to ground.
- Roll connector circuit is open, shorted or shorted to ground.
- Driver's airbag module is faulty.
- Airbag control module is faulty.

CAUTION:

- Before diagnosing the airbag system, be sure to turn the ignition switch OFF, disconnect the ground terminal from battery, and wait more than 20 seconds before starting to work.
- Before replacing the airbag module, seat belt pretensioner, roll connector, control module and sensor, reconnect each part and confirm that the warning light operates properly.
- When inspecting the airbag main harness, disconnect the airbag module connector and the seat belt pretensioner of the driver's and passenger's seats for safety reasons.

NOTE:

Prior to starting work, prepare two airbag registers (98299PA040).

Diagnostic Chart with Trouble Code

AIRBAG SYSTEM (DIAGNOSTICS)

WIRING DIAGRAM:

AB-00662

Step	Check	Yes	No
1	CHECK POOR CONTACT IN CONNECTOR. Check poor contact in connector between airbag control module and driver's airbag module.	Is there poor contact? Replace the airbag harness.	Go to step 2.

Diagnostic Chart with Trouble Code

AIRBAG SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
<p>2 CHECK DRIVER'S AIRBAG MODULE.</p> <p>1) Turn the ignition switch OFF, disconnect the battery ground cable, and wait more than 20 seconds.</p> <p>2) Remove the driver's airbag module.</p> <p>3) Connect the connector (1N) in the test harness N to connector (AB38).</p> <p>4) Connect the airbag resistor to connector (2N) in the test harness N.</p> <p>5) Connect the connectors (1Q) in the test harness Q to connector (AB37).</p> <p>6) Connect the airbag resistor to connector (2Q) in the test harness Q.</p> <p>7) Connect the battery ground cable and turn the ignition switch ON.</p>	Does the airbag warning light illuminate for 6 seconds and go off?	Replace the driver's airbag module. <Ref. to AB-16, Driver's Airbag Module.>	Go to step 3.
<p>3 CHECK ROLL CONNECTOR.</p> <p>1) Turn the ignition switch OFF, disconnect the battery ground cable, and wait more than 20 seconds.</p> <p>2) Disconnect the test harness N from connector (AB38).</p> <p>3) Disconnect the test harness Q from connector (AB37).</p> <p>4) Remove the instrument panel lower cover, disconnect the connector (AB7) from (AB2).</p> <p>5) Connect the connector (1P) in the test harness P to connector (AB2).</p> <p>6) Connect the airbag resistor to connector (2P) and (3P) in the test harness P.</p> <p>7) Connect the battery ground cable and turn the ignition switch ON.</p>	Does the airbag warning light illuminate for 6 seconds and go off?	Replace the roll connector. <Ref. to AB-25, Roll Connector.>	Go to step 4.
<p>4 CHECK AIRBAG MAIN HARNESS (DRIVER'S AIRBAG HARNESS).</p> <p>1) Turn the ignition switch OFF, disconnect the battery ground cable, and wait more than 20 seconds.</p> <p>2) Disconnect the airbag resistor from connector (2P) and (3P) in the test harness P.</p> <p>3) Remove the instrument panel side cover of passenger's side and disconnect the connector (AB10) and (AB9).</p> <p>4) Disconnect the connector (AB6) from airbag control module, and connect the connector (1U) in the test harness U.</p> <p>5) Measure the resistance between connector (2U) in the test harness U and connector (2P) and (3P) in the test harness P.</p> <p>Connector & terminal</p> <p>(2U) No. 2 — (2P) No. 1:</p> <p>(2U) No. 4 — (2P) No. 2:</p> <p>(2U) No. 8 — (3P) No. 3:</p> <p>(2U) No. 12 — (3P) No. 4:</p>	Is the resistance less than 10 Ω ?	Go to step 5.	Replace the airbag main harness with body harness.

Diagnostic Chart with Trouble Code

AIRBAG SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
5 CHECK AIRBAG MAIN HARNESS (DRIVER'S AIRBAG HARNESS). Measure the resistance between connector (2U) terminals in the test harness U. <i>Connector & terminal</i> <i>(2U) No. 2 — (2U) No. 4:</i> <i>(2U) No. 4 — Chassis ground:</i> <i>(2U) No. 2 — Chassis ground:</i> <i>(2U) No. 8 — (2U) No. 12:</i> <i>(2U) No. 8 — Chassis ground:</i> <i>(2U) No. 12 — Chassis ground:</i>	Is the resistance more than 1 MΩ?	Go to step 6.	Replace the airbag main harness with body harness.
6 CHECK AIRBAG CONTROL MODULE. 1) Connect all the connectors. 2) Erase the memory. 3) Perform the inspection mode. 4) Read the DTC	Is the same DTC displayed as in the current diagnosis still being output?	Replace the airbag control module. <Ref. to AB-22, Airbag Control Module.>	Go to step 7.
7 CHECK FOR ANY OTHER DTC ON DISPLAY.	Is any other DTC displayed?	Inspect the relevant DTC using "List of Diagnostic Trouble Code (DTC)"	Finish the diagnosis.

Diagnostic Chart with Trouble Code

AIRBAG SYSTEM (DIAGNOSTICS)

B: DTC 12 PASSENGER'S AIRBAG FAILURE

DTC DETECTING CONDITION:

- Airbag main harness circuit is open, shorted or shorted to ground.
- Airbag module harness (Passenger's side) circuit is open, shorted or shorted to ground.
- Passenger's airbag module is faulty.
- Airbag control module is faulty.

CAUTION:

- Before diagnosing the airbag system, be sure to turn the ignition switch OFF, disconnect the ground terminal from battery, and wait more than 20 seconds before starting to work.
- Before replacing the airbag module, seat belt pretensioner, roll connector, control module and sensor, reconnect each part and confirm that the warning light operates properly.
- When inspecting the airbag main harness, disconnect the airbag module connector and the seat belt pretensioner of the driver's and passenger's seats for safety reasons.

WIRING DIAGRAM:

AB-00663

Diagnostic Chart with Trouble Code

AIRBAG SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
1 CHECK POOR CONTACT IN CONNECTOR. Check if there is poor contact in connector between airbag control module and passenger's airbag module.	Is there poor contact?	Replace the airbag harness.	Go to step 2.
2 CHECK PASSENGER'S AIRBAG MODULE. 1) Turn the ignition switch OFF, disconnect the battery ground cable, and wait more than 20 seconds. 2) Remove the instrument panel side cover on the passenger's side. 3) Disconnect the connector (AB10) from (AB9). 4) Connect the connector (1P) in the test harness P to connector (AB9). 5) Connect the airbag resistor to connector (2P) and (3P) in the test harness P. 6) Connect the battery ground cable and turn the ignition switch ON.	Does the airbag warning light illuminate for 6 seconds and go off?	Replace the passenger's airbag module. <Ref. to AB-17, Passenger's Airbag Module.>	Go to step 3.
3 CHECK AIRBAG MAIN HARNESS (PASSENGER'S AIRBAG HARNESS). 1) Turn the ignition switch OFF, disconnect the battery ground cable, and wait more than 20 seconds. 2) Disconnect the airbag resistor from connector (2P) and (3P) in the test harness P. 3) Remove the instrument panel lower cover, disconnect the connector (AB7) from (AB2). 4) Disconnect the connector (AB6) from airbag control module, and connect the connector (1U) in the test harness U. 5) Measure the resistance between connector (2U) in the test harness U and connector (2P) and (3P) in the test harness P. Connector & terminal (2U) No. 3 — (2P) No. 1: (2U) No. 5 — (2P) No. 2: (2U) No. 9 — (3P) No. 3: (2U) No. 13 — (3P) No. 4:	Is the resistance less than 10 Ω?	Go to step 4.	Replace the airbag main harness with body harness.
4 CHECK AIRBAG MAIN HARNESS (PASSENGER'S AIRBAG HARNESS). Measure the resistance between connector (2U) terminals in the test harness U and between the connector (2U) and chassis ground. Connector & terminal (2U) No. 3 — (2U) No. 5: (2U) No. 3 — Chassis ground: (2U) No. 5 — Chassis ground: (2U) No. 9 — (2U) No. 13: (2U) No. 9 — Chassis ground: (2U) No. 13 — Chassis ground:	Is the resistance more than 1 MΩ?	Go to step 5.	Replace the airbag main harness with body harness.
5 CHECK AIRBAG CONTROL MODULE. 1) Connect all the connectors. 2) Erase the memory. 3) Perform the inspection mode. 4) Read the DTC.	Is the same DTC displayed as in the current diagnosis still being output?	Replace the airbag control module. <Ref. to AB-22, Airbag Control Module.>	Go to step 6.

Diagnostic Chart with Trouble Code

AIRBAG SYSTEM (DIAGNOSTICS)

	Step	Check	Yes	No
6	CHECK FOR ANY OTHER DTC ON DISPLAY.	Is any other DTC displayed?	Inspect the relevant DTC using "List of Diagnostic Trouble Code (DTC)". <Ref. to AB(diag)-41, List of Diagnostic Trouble Code (DTC).>	Finish the diagnosis.

Diagnostic Chart with Trouble Code

AIRBAG SYSTEM (DIAGNOSTICS)

C: DTC 15 DRIVER'S AIRBAG FAILURE

DTC DETECTING CONDITION:

- Airbag main harness circuit (Driver's side) is shorted to power supply.
- Airbag module harness circuit (Driver's side) is shorted to power supply.
- Roll connector is shorted to the power supply.
- Driver's airbag module is faulty.
- Airbag control module is faulty.

CAUTION:

- Before diagnosing the airbag system, be sure to turn the ignition switch OFF, disconnect the ground terminal from battery, and wait more than 20 seconds before starting to work.
- Before replacing the airbag module, seat belt pretensioner, roll connector, control module and sensor, reconnect each part and confirm that the warning light operates properly.
- When inspecting the airbag main harness, disconnect the airbag module connector and the seat belt pretensioner of the driver's and passenger's seats for safety reasons.

NOTE:

Prior to starting work, prepare two airbag registers (98299PA040).

WIRING DIAGRAM:

Diagnostic Chart with Trouble Code

AIRBAG SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
1 CHECK POOR CONTACT IN CONNECTOR. Check if there is poor contact in connector between airbag control module and driver's airbag module.	Is there poor contact?	Replace the airbag harness.	Go to step 2.
2 CHECK DRIVER'S AIRBAG MODULE. 1) Turn the ignition switch OFF, disconnect the battery ground cable, and wait more than 20 seconds. 2) Remove the driver's airbag module. 3) Connect the connector (AB38) to connector (1N) in the test harness N. 4) Connect the airbag resistor to connector (2N) in the test harness N. 5) Connect the connectors (1Q) in the test harness Q to connector (AB37). 6) Connect the airbag resistor to connector (2Q) in the test harness Q. 7) Connect the battery ground cable and turn the ignition switch ON.	Does the airbag warning light illuminate for 6 seconds and go off?	Replace the driver's airbag module. <Ref. to AB-16, Driver's Airbag Module.>	Go to step 3.
3 CHECK ROLL CONNECTOR. 1) Turn the ignition switch OFF, disconnect the battery ground cable, and wait more than 20 seconds. 2) Disconnect the test harness N from connector (AB38). 3) Disconnect the test harness Q from connector (AB37). 4) Remove the instrument panel lower cover, disconnect the connector (AB7) from (AB2). 5) Connect the connector (1P) in the test harness P to connector (AB2). 6) Connect the airbag resistor to connector (2P) and (3P) in the test harness P. 7) Connect the battery ground cable and turn the ignition switch ON.	Does the airbag warning light illuminate for 6 seconds and go off?	Replace the roll connector. <Ref. to AB-25, Roll Connector.>	Go to step 4.
4 CHECK AIRBAG MAIN HARNESS (DRIVER'S AIRBAG HARNESS). 1) Turn the ignition switch OFF, disconnect the battery ground cable, and wait more than 20 seconds. 2) Disconnect the airbag resistor from connector (2P) and (3P) in the test harness P. 3) Remove the instrument panel side cover of passenger's side and disconnect the connector (AB10) and (AB9). 4) Disconnect the connector (AB6) from airbag control module, and connect the connector (1U) in the test harness U. 5) Connect the battery ground cable and turn the ignition switch ON. (engine OFF) 6) Measure the voltage between connector (2U) in the test harness U and chassis ground. Connector & terminal (2U) No. 4 (+) — Chassis ground (-): (2U) No. 2 (+) — Chassis ground (-): (2U) No. 8 (+) — Chassis ground (-): (2U) No. 12 (+) — Chassis ground (-):	Is the voltage less than 1 V?	Go to step 5.	Replace the airbag main harness with body harness.

Diagnostic Chart with Trouble Code

Diagnostic Chart with Trouble Code

AIRBAG SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
1 CHECK POOR CONTACT IN CONNECTOR. Check if there is poor contact in connector between airbag control module and passenger's airbag module.	Is there poor contact?	Replace the airbag main harness with body harness.	Go to step 2.
2 CHECK PASSENGER'S AIRBAG MODULE. 1) Turn the ignition switch OFF, disconnect the battery ground cable, and wait more than 20 seconds. 2) Remove the instrument panel side cover on the passenger's side. 3) Disconnect the connector (AB10) from (AB9). 4) Connect the connector (1P) in the test harness P to connector (AB9). 5) Connect the airbag resistor to connector (2P) and (3P) in the test harness P. 6) Connect the battery ground cable and turn the ignition switch ON.	Does the airbag warning light illuminate for 6 seconds and go off?	Replace the passenger's airbag module. <Ref. to AB-17, Passenger's Airbag Module.>	Go to step 3.
3 CHECK AIRBAG MAIN HARNESS (PASSENGER'S AIRBAG HARNESS). 1) Turn the ignition switch OFF, disconnect the battery ground cable, and wait more than 20 seconds. 2) Disconnect the airbag resistor from connector (2P) and (3P) in the test harness P. 3) Remove the instrument panel lower cover, disconnect the connector (AB7) from (AB2). 4) Disconnect the connector (AB6) from airbag control module, and connect the connector (1U) in the test harness U. 5) Measure the voltage between connector (2U) in the test harness U and chassis ground. Connector & terminal <i>(2U) No. 3 (+) — Chassis ground (-):</i> <i>(2U) No. 5 (+) — Chassis ground (-):</i> <i>(2U) No. 9 (+) — Chassis ground (-):</i> <i>(2U) No. 13 (+) — Chassis ground (-):</i>	Is the voltage less than 1 V?	Go to step 4.	Replace the airbag main harness with body harness.
4 CHECK AIRBAG CONTROL MODULE. 1) Connect all the connectors. 2) Erase the memory. 3) Perform the inspection mode. 4) Read the DTC.	Is the same DTC displayed as in the current diagnosis still being output?	Replace the airbag control module. <Ref. to AB-22, Airbag Control Module.>	Go to step 5.
5 CHECK FOR ANY OTHER DTC ON DISPLAY.	Is any other DTC displayed?	Inspect the relevant DTC using "List of Diagnostic Trouble Code (DTC)". <Ref. to AB(diag)-41, List of Diagnostic Trouble Code (DTC).>	Finish the diagnosis.

Diagnostic Chart with Trouble Code

AIRBAG SYSTEM (DIAGNOSTICS)

E: DTC 21 AIRBAG ECU FAILURE

DTC DETECTING CONDITION:

Airbag control module is faulty.

CAUTION:

- Before diagnosing the airbag system, be sure to turn the ignition switch OFF, disconnect the ground terminal from battery, and wait more than 20 seconds before starting to work.
- Before replacing the airbag module, seat belt pretensioner, roll connector, control module and sensor, reconnect each part and confirm that the warning light operates properly.

	Step	Check	Yes	No
1	CHECK IF DTC 21 IS INDICATED. Read the DTC. <Ref. to AB(diag)-27, READ DIAGNOSTIC TROUBLE CODE (DTC), OPERATION, Subaru Select Monitor.>	Is DTC 21 indicated for airbag warning light?	Replace the airbag control module. <Ref. to AB-22, Airbag Control Module.>	Perform the clear memory mode. <Ref. to AB(diag)-28, CLEAR MEMORY MODE, OPERATION, Subaru Select Monitor.>

Diagnostic Chart with Trouble Code

AIRBAG SYSTEM (DIAGNOSTICS)

F: DTC 22 FRONT AIRBAG FIRING OUTPUT WIRING DIAGRAM:

AB-00922

This DTC is indicated when the front airbag module and the pretensioner are deployed. Once this DTC is displayed, the memory cannot be cleared. Replace the following parts.

- Airbag control module. <Ref. to AB-22, Airbag Control Module.>
- Driver's airbag module. <Ref. to AB-16, Driver's Airbag Module.>
- Passenger's airbag module. <Ref. to AB-17, Passenger's Airbag Module.>
- Front sub sensor of both sides. <Ref. to AB-26, Front Sub Sensor.>
- Front seat belt outer with pretensioner of both sides. <Ref. to SB-10, Front Seat Belt.>

Diagnostic Chart with Trouble Code

AIRBAG SYSTEM (DIAGNOSTICS)

G: DTC 23 CONNECTOR TO AIRBAG ECU

DTC DETECTING CONDITION:

(AB6), (AB17) and (AB18) are not connected properly to airbag control module.

CAUTION:

Before diagnosing the airbag system, be sure to turn the ignition switch OFF, disconnect the ground terminal from battery, and wait more than 20 seconds before starting to work.

Step	Check	Yes	No
1 CHECK POOR CONTACT IN CONNECTORS (AB6), (AB17) AND (AB18). 1) Turn the ignition switch OFF, disconnect the battery ground cable, and wait more than 20 seconds. 2) Disconnect the connectors (AB6), (AB17) and (AB18) from airbag control module.	Is there rust or damage on the harness connector and the control module connector?	Replace the airbag control module <Ref. to AB-22, Airbag Control Module.>, replace the body harness with airbag main harness. replace the body harness with side airbag harness.	Go to step 2.
2 CHECK POOR CONTACT IN CONNECTORS (AB6), (AB17) AND (AB18). 1) Ensure that the connectors are firmly reconnected. 2) Connect the battery ground cable and turn the ignition switch ON.	Does the airbag warning light illuminate for 6 seconds and go off?	Go to step 3.	Replace the airbag control module. <Ref. to AB-22, Airbag Control Module.>
3 CHECK AIRBAG CONTROL MODULE. 1) Connect all the connectors. 2) Erase the memory. 3) Perform the inspection mode. 4) Read the DTC.	Is the same DTC displayed as in the current diagnosis still being output?	Replace the airbag control module. <Ref. to AB-22, Airbag Control Module.>	Go to step 4.
4 CHECK FOR ANY OTHER DTC ON DISPLAY.	Is any other DTC displayed?	Inspect the relevant DTC using "List of Diagnostic Trouble Code (DTC)". <Ref. to AB(diag)-41, List of Diagnostic Trouble Code (DTC).>	Finish the diagnosis.

Diagnostic Chart with Trouble Code

AIRBAG SYSTEM (DIAGNOSTICS)

H: DTC 24 IG1 OPEN

DTC DETECTING CONDITION:

- Airbag control module is faulty.
- Airbag main harness circuit is open.
- Fuse No. 25 (in joint box) is blown.
- Body harness circuit is open.

CAUTION:

- Before diagnosing the airbag system, be sure to turn the ignition switch OFF, disconnect the ground terminal from battery, and wait more than 20 seconds before starting to work.
- Before replacing the airbag module, seat belt pretensioner, roll connector, control module and sensor, reconnect each part and confirm that the warning light operates properly.
- When inspecting the airbag main harness, disconnect the airbag module connector and the seat belt pretensioner of the driver's and passenger's seats for safety reasons.

WIRING DIAGRAM:

AB-00938

Diagnostic Chart with Trouble Code

AIRBAG SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
1 CHECK AIRBAG CONTROL MODULE. 1) Turn the ignition switch OFF, disconnect the battery ground cable, and wait more than 20 seconds. 2) Disconnect the connector (AB6) from airbag control module. 3) Connect the connector (1U) in the test harness U to connector (AB6). 4) Connect the battery ground cable and turn the ignition switch ON. 5) Measure the voltage between connector (2U) in the test harness U and chassis ground. Connector & terminal (2U) No. 1 (+) — Chassis ground (-):	Is the voltage more than 10 V?	Replace the airbag control module. <Ref. to AB-22, Airbag Control Module.>	Go to step 2.
2 CHECK FUSE NO. 25 (IN JOINT BOX). 1) Confirm that the ignition switch is turned OFF. 2) Remove the fuse No. 25 (in joint box) and perform visual inspection.	Is the fuse No. 25 blown out?	Replace the fuse No. 25. If fuse No. 25 is blown out again, repair the body harness or replace the airbag main harness with body harness.	Go to step 3.
3 CHECK AIRBAG CONTROL MODULE. 1) Connect all the connectors. 2) Erase the memory. 3) Perform the inspection mode. 4) Read the DTC.	Is the same DTC displayed as in the current diagnosis still being output?	Replace the airbag control module. <Ref. to AB-22, Airbag Control Module.>	Go to step 4.
4 CHECK FOR ANY OTHER DTC ON DISPLAY.	Is any other DTC displayed?	Inspect the relevant DTC using "List of Diagnostic Trouble Code (DTC)". <Ref. to AB(diag)-41, List of Diagnostic Trouble Code (DTC).>	Finish the diagnosis.

Diagnostic Chart with Trouble Code

AIRBAG SYSTEM (DIAGNOSTICS)

I: DTC 25 IG2 OPEN

DTC DETECTING CONDITION:

- Airbag control module is faulty.
- Airbag main harness circuit is open.
- Fuse No. 12 (in joint box) is blown.
- Body harness circuit is open.

CAUTION:

- Before diagnosing the airbag system, be sure to turn the ignition switch OFF, disconnect the ground terminal from the battery, and wait more than 20 seconds before starting to work.
- Before replacing the airbag module, seat belt pretensioner, roll connector, control module and sensor, reconnect each part and confirm that the warning light operates properly.
- When inspecting the airbag main harness, disconnect the airbag module connector and the seat belt pretensioner of the driver's and passenger's seats for safety reasons.

AB-00939

Diagnostic Chart with Trouble Code

AIRBAG SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
1 CHECK AIRBAG CONTROL MODULE. 1) Turn the ignition switch OFF, disconnect the battery ground cable, and wait more than 20 seconds. 2) Disconnect the connector (AB6) from airbag control module. 3) Connect the connector (1U) in the test harness U to connector (AB6). 4) Connect the battery ground cable and turn the ignition switch ON. 5) Measure the voltage between connector (2U) in the test harness U and chassis ground. Connector & terminal (2U) No. 6 (+) — Chassis ground (-):	Is the voltage more than 10 V?	Replace the airbag control module. <Ref. to AB-22, Airbag Control Module.>	Go to step 2.
2 CHECK FUSE NO. 12 (IN JOINT BOX). 1) Confirm that the ignition switch is turned OFF. 2) Remove the fuse No. 12 (in joint box) and perform visual inspection.	Is the fuse No. 12 blown out?	Replace the fuse No. 12. If fuse No. 12 is blown out again, repair the body harness, replace the airbag main harness with body harness.	Go to step 3.
3 CHECK AIRBAG CONTROL MODULE. 1) Connect all the connectors. 2) Erase the memory. 3) Perform the inspection mode. 4) Read the DTC.	Is the same DTC displayed as in the current diagnosis still being output?	Replace the airbag control module. <Ref. to AB-22, Airbag Control Module.>	Go to step 4.
4 CHECK FOR ANY OTHER DTC ON DISPLAY.	Is any other DTC displayed?	Inspect the relevant DTC using "List of Diagnostic Trouble Code (DTC)". <Ref. to AB(diag)-41, List of Diagnostic Trouble Code (DTC).>	Finish the diagnosis.

Diagnostic Chart with Trouble Code

AIRBAG SYSTEM (DIAGNOSTICS)

J: DTC 26 PASSENGER'S AIRBAG INDICATOR FAILURE

DTC DETECTING CONDITION:

- Passenger's airbag indicator is faulty.
- Airbag control module is faulty.
- Airbag main harness circuit is open.
- Body harness circuit is open.

CAUTION:

- Before diagnosing the airbag system, be sure to turn the ignition switch OFF, disconnect the ground terminal from battery, and wait more than 20 seconds before starting to work.
- Before replacing the airbag module, seat belt pretensioner, roll connector, control module and sensor, reconnect each part and confirm that the warning light operates properly.
- When inspecting the airbag harness, disconnect each airbag module connector and seat belt pretensioner for safety reasons.

WIRING DIAGRAM:

AB-00941

Diagnostic Chart with Trouble Code

AIRBAG SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
1 CHECK POOR CONTACT. 1) Turn the ignition switch OFF, disconnect the battery ground cable, and wait more than 20 seconds. 2) Confirm that the firm contact is secured between the airbag control module and clock.	Is there poor contact in each connector?	Replace the airbag harness connector.	Go to step 2.
2 CHECK AIRBAG MAIN HARNESS. 1) Disconnect the connector (AB6) from airbag control module. 2) Connect the battery ground cable and turn the ignition switch ON. NOTE: Both ON/OFF doesn't light when it is normal.	Does the passenger's airbag indicator illuminate?	Go to step 3.	Go to step 4.
3 CHECK AIRBAG MAIN HARNESS. 1) Turn the ignition switch OFF. 2) Remove the clock and disconnect the connector (i59). 3) Connect the connector (1U) in the test harness U to connector (AB6). 4) Measure the resistance between connector (2U), (4U) in the test harness U and chassis ground. Connector & terminal (2U) No. 14 — (4U) No. 17: (2U) No. 14 — Chassis ground: (4U) No. 17 — Chassis ground:	Is the resistance more than 1 MΩ?	Replace the clock. <Ref. to IDI-21, Clock.>	Repair the bulk-head harness or replace airbag main harness with body harness.
4 CHECK AIRBAG MAIN HARNESS. 1) Connect the connector (7U) and (8U). 2) Connect the battery ground cable, and turn the ignition switch ON. NOTE: Both ON/OFF doesn't light when it is normal.	Does the passenger's airbag indicator illuminate?	Replace the airbag control module. <Ref. to AB-22, Airbag Control Module.>	Go to step 5.
5 CHECK AIRBAG MAIN HARNESS. 1) Turn the ignition switch OFF. 2) Connect the connector (1U) in the test harness U to connector (AB6). 3) Measure the resistance between connector (2U), (4U) in the test harness U and connector (i59). Connector & terminal (2U) No. 14 — (i59) No. 4: (4U) No. 17 — (i59) No. 3:	Is the resistance less than 10 Ω?	Go to step 6.	Repair the bulk-head harness or replace airbag main harness with body harness.
6 CHECK BODY HARNESS. 1) Turn the ignition switch ON. 2) Measure the voltage between connector (i59) and chassis ground. Connector & terminal (i59) No. 8 — Chassis ground:	Is the voltage more than 10 V?	Replace the clock. <Ref. to IDI-21, Clock.>	Repair the power line to clock.

Diagnostic Chart with Trouble Code

AIRBAG SYSTEM (DIAGNOSTICS)

K: DTC 27 ODS COMMUNICATION ERROR

DTC DETECTING CONDITION:

Occupant detection control module communication failure

Step	Check	Yes	No
1 CHECK AIRBAG HARNESS. 1) Turn the ignition switch OFF, disconnect the battery ground cable, and wait more than 20 seconds. 2) Disconnect the connector (AB18) from airbag control module. 3) Disconnect the connector (AB53) from lower part of passenger's side occupant detection control module. 4) Connect the connector (1U) in test harness U to connector (AB18). 5) Connect the connector (1Z) in test harness Z to connector (AB53). 6) Measure the resistance between connector (3U) in test harness U and (2Z) in test harness Z. <i>Connector & terminal</i> <i>(3U) No. 2 — (2Z) No. 5:</i> <i>(3U) No. 4 — (2Z) No. 6:</i>	Is the resistance less than 10 Ω?	Go to step 2.	Replace the airbag rear harness with body harness.
2 CHECK AIRBAG HARNESS. Measure the resistance between connector (3U) in the test harness U and chassis ground. <i>Connector & terminal</i> <i>(3U) No. 2 — Chassis ground:</i>	Is the resistance less than 10 Ω?	Go to step 3.	Replace the airbag rear harness with body harness.
3 CHECK OCCUPANT DETECTION SYSTEM. 1) Connect the connector (AB18) to airbag control module. 2) Connect the connector (AB53) from the occupant detection control module behind the passenger's seat. 3) Connect the battery ground cable. 4) Check the occupant detection system. <Ref. to OD(diag)-2, Basic Diagnostic Procedure.>	Is there any fault in the occupant detection system.	Repair the occupant detection system. <Ref. to OD(diag)-2, Basic Diagnostic Procedure.>	Finish the diagnosis

L: DTC 28 ODS ADJUSTMENT/INSPECTION HALT

NOTE:

Refer to "Occupant Detection System" for DTC 28. <Ref. to OD(diag)-23, DTC 28 ADJUSTMENT / INSPECTION HALT, Diagnostic Procedure with Diagnostic Trouble Code (DTC).>

M: DTC 29 ODS FAILURE

NOTE:

Refer to "Occupant Detection System" for DTC 29. <Ref. to OD(diag)-25, DTC 29 ODS FAILURE, Diagnostic Procedure with Diagnostic Trouble Code (DTC).>

Diagnostic Chart with Trouble Code

AIRBAG SYSTEM (DIAGNOSTICS)

N: DTC 31 FRONT SUB SENSOR RH FAILURE

DTC DETECTING CONDITION:

- Front sub sensor harness (RH) circuit is shorted.
- Front sub sensor harness (RH) circuit is open.
- Front sub sensor (RH) is faulty.
- Airbag control module is faulty.

CAUTION:

- Before diagnosing the airbag system, be sure to turn the ignition switch OFF, disconnect the ground terminal from the battery, and wait more than 20 seconds before starting to work.
- Before replacing the airbag module, seat belt pretensioner, roll connector, control module and sensor, reconnect each part and confirm that the warning light operates properly.
- When inspecting the airbag main harness, disconnect the airbag module connector and the seat belt pretensioner of the driver's and passenger's seats for safety reasons.

WIRING DIAGRAM:

AB-00667

Diagnostic Chart with Trouble Code

AIRBAG SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
1 CHECK POOR CONTACT IN CONNECTOR. Check if there is poor contact between airbag control module and front sub sensor RH.	Is there poor contact?	Replace the airbag main harness with body harness.	Go to step 2.
2 CHECK AIRBAG MAIN HARNESS (FRONT SUB SENSOR HARNESS RH). 1) Turn the ignition switch OFF, disconnect the battery ground cable, and wait more than 20 seconds. 2) Remove the instrument panel lower cover and disconnect the connector (AB7) and (AB2). 3) Remove the instrument panel side cover on passenger's side and disconnect the connector (AB10) and (AB9). 4) Disconnect the connector (AB6) from airbag control module. 5) Connect the connector (1U) in the test harness U to connector (AB6). 6) Disconnect the front sub sensor (RH), and then connect the connector (1H) in the test harness H to connector (AB16). 7) Measure the resistance between connector (3U) in the test harness U and connector (3H) in the test harness H. <i>Connector & terminal</i> <i>(3U) No. 7 — (3H) No. 5:</i> <i>(3U) No. 9 — (3H) No. 6:</i>	Is the resistance less than 10 Ω?	Go to step 3.	Replace the airbag main harness with body harness.
3 CHECK AIRBAG MAIN HARNESS (FRONT SUB SENSOR HARNESS RH). Measure the resistance between connector (3U) in the test harness U and chassis ground. <i>Connector & terminal</i> <i>(3U) No. 7 — Chassis ground:</i> <i>(3U) No. 9 — Chassis ground:</i>	Is the resistance more than 1 MΩ?	Replace the front sub sensor (RH). <Ref. to AB-26, Front Sub Sensor.> When the sensor is not OK, though the sensor is replaced, replace the airbag control module. <Ref. to AB-22, Airbag Control Module.>	Go to step 4.
4 CHECK AIRBAG CONTROL MODULE. 1) Connect all the connectors. 2) Erase the memory. 3) Perform the inspection mode. 4) Read the DTC.	Is the same DTC displayed as in the current diagnosis still being output?	Replace the airbag control module. <Ref. to AB-22, Airbag Control Module.>	Go to step 5.
5 CHECK FOR ANY OTHER DTC ON DISPLAY.	Is any other DTC displayed?	Inspect the relevant DTC using "List of Diagnostic Trouble Code (DTC)". <Ref. to AB(diag)-41, List of Diagnostic Trouble Code (DTC).>	Finish the diagnosis.

Diagnostic Chart with Trouble Code

AIRBAG SYSTEM (DIAGNOSTICS)

O: DTC 32 FRONT SUB SENSOR LH FAILURE

DTC DETECTING CONDITION:

- Front sub sensor harness (LH) circuit is shorted.
- Front sub sensor harness (LH) circuit is open.
- Front sub sensor (LH) is faulty.
- Airbag control module is faulty.

CAUTION:

- Before diagnosing the airbag system, be sure to turn the ignition switch OFF, disconnect the ground terminal from battery, and wait more than 20 seconds before starting to work.
- Before replacing the airbag module, seat belt pretensioner, roll connector, control module and sensor, reconnect each part and confirm that the warning light operates properly.
- When inspecting the airbag main harness, disconnect the airbag module connector and the seat belt pretensioner of the driver's and passenger's seats for safety reasons.

WIRING DIAGRAM:

AB-00668

Diagnostic Chart with Trouble Code

AIRBAG SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
1 CHECK POOR CONTACT IN CONNECTOR. Check if there is poor contact between airbag control module and front sub sensor LH.	Is there poor contact?	Replace the airbag main harness with body harness.	Go to step 2.
2 CHECK AIRBAG MAIN HARNESS (FRONT SUB SENSOR HARNESS LH). 1) Turn the ignition switch OFF, disconnect the battery ground cable, and wait more than 20 seconds. 2) Remove the instrument panel lower cover and disconnect the connector (AB7) and (AB2). 3) Remove the instrument panel side cover on passenger's side and disconnect the connector (AB10) and (AB9). 4) Disconnect the connector (AB6) from airbag control module. 5) Connect the connector (1U) in the test harness U to connector (AB6). 6) Disconnect the front sub sensor (LH), and then connect the connector (1H) in the test harness H to connector (AB13). 7) Measure the resistance between connector (3U) in the test harness U and connector (3H) in the test harness H. <i>Connector & terminal</i> <i>(3U) No. 6 — (3H) No. 5:</i> <i>(3U) No. 8 — (3H) No. 6:</i>	Is the resistance less than 10 Ω?	Go to step 3.	Replace the airbag main harness with body harness.
3 CHECK AIRBAG MAIN HARNESS (FRONT SUB SENSOR HARNESS LH). Measure the resistance between connector (3U) in the test harness U and chassis ground. <i>Connector & terminal</i> <i>(3U) No. 6 — Chassis ground:</i> <i>(3U) No. 8 — Chassis ground:</i>	Is the resistance more than 1 MΩ?	Replace the front sub sensor (LH). <Ref. to AB-26, Front Sub Sensor.> When the sensor is not OK, though the sensor is replaced, replace the airbag control module. <Ref. to AB-22, Airbag Control Module.>	Go to step 4.
4 CHECK AIRBAG CONTROL MODULE. 1) Connect all the connectors. 2) Erase the memory. 3) Perform the inspection mode. 4) Read the DTC.	Is the same DTC displayed as in the current diagnosis still being output?	Replace the airbag control module. <Ref. to AB-22, Airbag Control Module.>	Go to step 5.
5 CHECK FOR ANY OTHER DTC ON DISPLAY.	Is any other DTC displayed?	Inspect the relevant DTC using "List of Diagnostic Trouble Code (DTC)". <Ref. to AB(diag)-41, List of Diagnostic Trouble Code (DTC).>	Finish the diagnosis.

Diagnostic Chart with Trouble Code

AIRBAG SYSTEM (DIAGNOSTICS)

P: DTC 33 FRONT SUB SENSOR RH FAILURE

DTC DETECTING CONDITION:

Front sub sensor (RH) is faulty.

When DTC 33 is displayed, the circuit within the front sub sensor (RH) is faulty. Replace the front sub sensor (RH). <Ref. to AB-26, Front Sub Sensor.>

Q: DTC 34 FRONT SUB SENSOR LH FAILURE

DTC DETECTING CONDITION:

Front sub sensor (LH) is faulty.

When DTC 34 is displayed, the circuit within the front sub sensor (LH) is faulty. Replace the front sub sensor (LH). <Ref. to AB-26, Front Sub Sensor.>

Diagnostic Chart with Trouble Code

AIRBAG SYSTEM (DIAGNOSTICS)

R: DTC 36 SEAT POSITION SENSOR LH FAILURE

DTC DETECTING CONDITION:

- Driver's seat position sensor is faulty.
- Airbag control module is faulty.
- Airbag rear harness circuit is open, short or shorted to ground.

CAUTION:

- Before diagnosing the airbag system, be sure to turn the ignition switch OFF, disconnect the ground cable from battery, and wait more than 20 seconds before starting to work.
- Before replacing the airbag module, seat belt pretensioner, roll connector, control module and sensor, reconnect each part and confirm that the warning light operates properly.
- When inspecting the airbag harness, disconnect each airbag module connector and seat belt pretensioner for safety reasons.

WIRING DIAGRAM:

AB-00942

Diagnostic Chart with Trouble Code

AIRBAG SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
1 CHECK SEAT POSITION SENSOR (LH). 1) Turn the ignition switch OFF, disconnect the battery ground cable, and wait more than 20 seconds. 2) Disconnect the connector (AB52) from seat position sensor (LH). 3) Connect the connector (2Y) in test harness Y to connector (AB52). 4) Connect the battery ground cable and turn the ignition switch ON.	Does the airbag warning light illuminate for 6 seconds and go off?	Replace the seat position sensor (LH) with driver's seat slide rail assembly. <Ref. to SE-9, Front Seat.>	Go to step 2.
2 CHECK AIRBAG REAR HARNESS (SEAT POSITION SENSOR HARNESS LH). 1) Turn the ignition switch OFF, disconnect the battery ground cable, and wait more than 20 seconds. 2) Disconnect the connector (AB23) from side airbag module (LH). 3) Disconnect the connector (AB31) from curtain airbag module (LH). 4) Disconnect the connector (AB21) from seat belt pretensioner (LH). 5) Disconnect the connector (AB17) from airbag control module. 6) Connect the connector (1U) in test harness U to connector (AB17). 7) Disconnect the seat position sensor (LH) and connect the connector (1H) in test harness H to connector (AB52). 8) Measure the resistance between connector (3U) in test harness U and connector (3H) in test harness H. <i>Connector & Terminal</i> <i>(3U) No. 1 — (3H) No. 6:</i> <i>(3U) No. 3 — (3H) No. 5:</i>	Is the resistance less than 10 Ω ?	Go to step 3.	Replace the airbag rear harness with body harness.
3 CHECK AIRBAG REAR HARNESS. Measure the resistance between connector (3U) in the test harness U and chassis ground. <i>Connector & terminal</i> <i>(3U) No. 1 — Chassis ground:</i>	Is the resistance less than 10 Ω ?	Replace the airbag rear harness with body harness.	Replace the airbag control module.

S: DTC 37 BUCKLE SWITCH RH FAILURE

NOTE:

For DTC 37, refer to Occupant Detection System. <Ref. to OD(diag)-26, DTC 37 BUCKLE SWITCH RH FAILURE, Diagnostic Procedure with Diagnostic Trouble Code (DTC).>

Diagnostic Chart with Trouble Code

AIRBAG SYSTEM (DIAGNOSTICS)

T: DTC 38 BUCKLE SWITCH LH FAILURE

DTC DETECTING CONDITION:

- Driver's seat buckle switch circuit is open, shorted or shorted to ground.
- Airbag rear harness circuit is open, shorted or shorted to ground.
- Airbag control module is faulty.

CAUTION:

- Before diagnosing the airbag system, be sure to turn the ignition switch OFF, disconnect the ground cable from battery, and wait more than 20 seconds before starting to work.
- Before replacing the airbag module, seat belt pretensioner, roll connector, control module and sensor, reconnect each part and confirm that the warning light operates properly.
- When inspecting the airbag harness, disconnect each airbag module connector and seat belt pretensioner for safety reasons.

WIRING DIAGRAM:

Diagnostic Chart with Trouble Code

AIRBAG SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
1 CHECK SEAT BELT BUCKLE SWITCH (LH). 1) Turn the ignition switch OFF, disconnect the battery ground cable, and wait more than 20 seconds. 2) Disconnect the connector (AB51) from buckle switch (LH). 3) Connect the connector (1Y) in test harness Y to connector (AB51). 4) Connect the battery ground cable and turn the ignition switch ON.	Does the airbag warning light illuminate for 6 seconds and go off?	Replace the seat belt buckle switch (LH). <Ref. to SB-10, Front Seat Belt.>	Go to step 2.
2 CHECK AIRBAG REAR HARNESS (BUCKLE SWITCH HARNESS LH). 1) Turn the ignition switch OFF, disconnect the battery ground cable, and wait more than 20 seconds. 2) Disconnect the connector (AB23) from side airbag module (LH). 3) Disconnect the connector (AB31) from curtain airbag module (LH). 4) Disconnect the connector (AB21) from seat belt pretensioner (LH). 5) Disconnect the connector (AB17) from airbag control module. 6) Connect the connector (1U) in test harness U to connector (AB17). 7) Disconnect the seat belt buckle switch (LH) and connect the connector (1D) in test harness D to connector (AB51). 8) Measure the resistance between connectors (4U) and (5U) in test harness U and connector (3D) in test harness D. Connector & Terminal (4U) No. 11 — (3D) No. 3: (4U) No. 9 — (3D) No. 4:	Is the resistance less than 10 Ω ?	Go to step 3.	Replace the airbag rear harness with body harness.
3 CHECK AIRBAG REAR HARNESS. Measure the resistance between connector (3U) in the test harness U and chassis ground. Connector & terminal (4U) No. 9 — (4U) No. 11: (4U) No. 9 — Chassis ground:	Is the resistance less than 10 Ω ?	Replace the airbag rear harness with body harness.	Replace the airbag control module.

Diagnostic Chart with Trouble Code

AIRBAG SYSTEM (DIAGNOSTICS)

U: DTC 39 SEAT BELT WARNING FAILURE

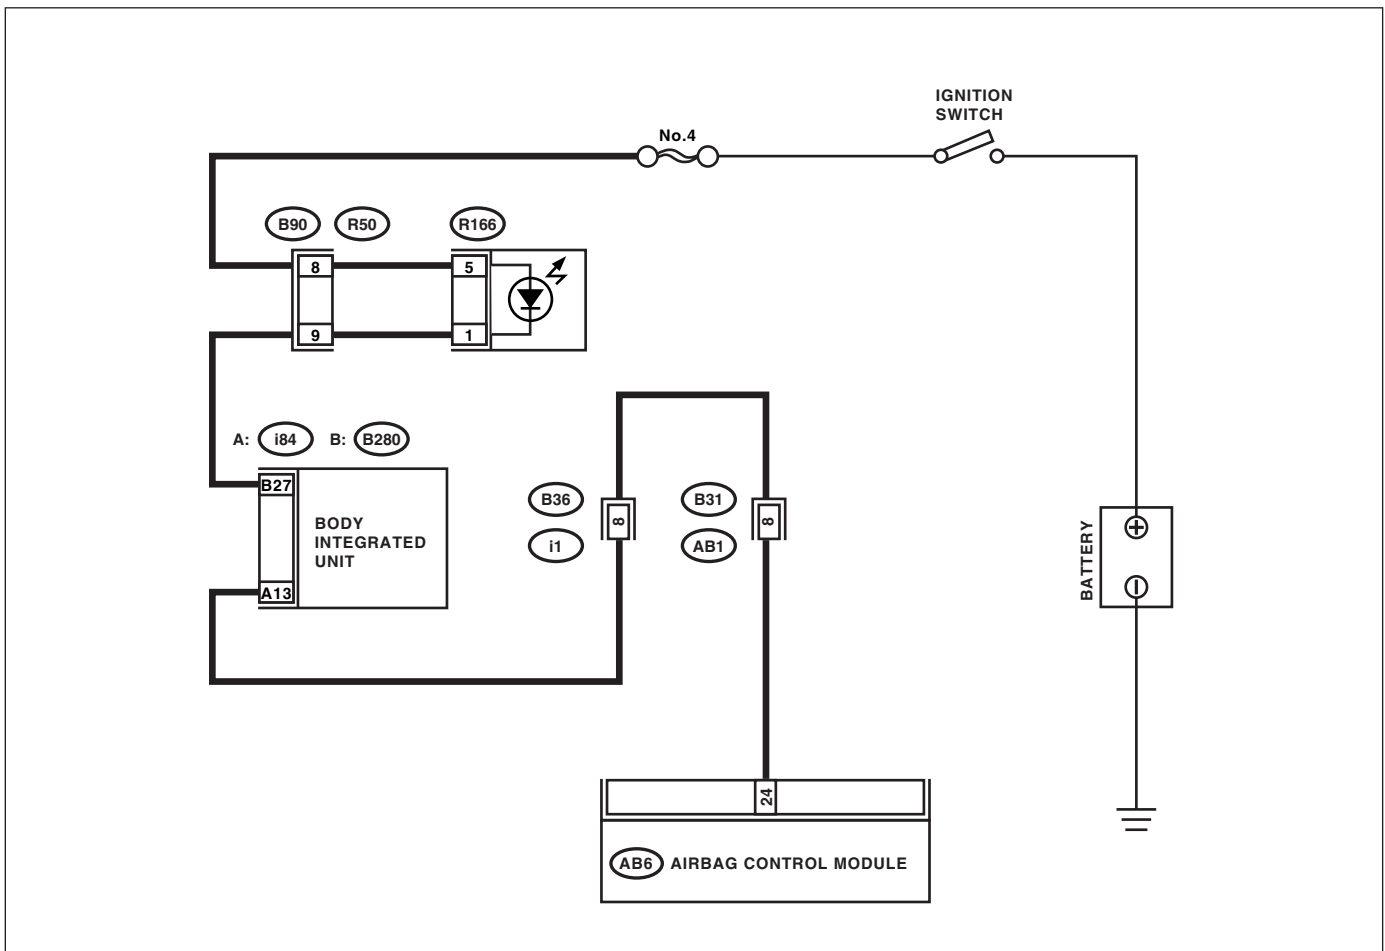

DTC DETECTING CONDITION:

- Passenger's seat belt warning system is faulty.
- Airbag control module is faulty.
- Body integrated unit is faulty.
- Airbag rear harness circuit is open, shorted or shorted to ground.
- Harness circuit between body integrated unit and airbag control module is open, shorted or shorted to ground.

CAUTION:

- Before diagnosing the airbag system, be sure to turn the ignition switch OFF, disconnect the ground cable from battery, and wait more than 20 seconds before starting to work.
- Before replacing the airbag module, seat belt pretensioner, roll connector, control module and sensor, reconnect each part and confirm that the warning light operates properly.
- When inspecting the airbag harness, disconnect each airbag module connector and seat belt pretensioner for safety reasons.

WIRING DIAGRAM:

AB-00944

Diagnostic Chart with Trouble Code

AIRBAG SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
1 CHECK AIRBAG HARNESS. 1) Turn the ignition switch OFF, disconnect the battery ground cable, and wait more than 20 seconds. 2) Disconnect the connector (AB6) from airbag control module. 3) Connect the battery ground cable and turn the ignition switch ON.	Does the passenger's seat belt warning light blink for 6 seconds and then go off?	Go to step 3.	Go to step 2.
2 CHECK AIRBAG HARNESS. 1) Turn the ignition switch OFF. 2) Connect the connector (1U) in the test harness U to connector (AB6). 3) Measure the resistance between connector (4U) in the test harness U and chassis ground. Connector & terminal (4U) No. 16 — Chassis ground:	Is the resistance more than 1 M Ω ?	Replace body integrated unit.	Repair the bulkhead harness or replace airbag main harness with body harness.
3 CHECK AIRBAG HARNESS. 1) Connect the connector (7U) and (8U) in the test harness in step 2 condition. 2) Turn the ignition switch ON.	Does the seat belt warning light blink for 6 seconds and continue to illuminate/blink?	Replace the airbag control module. <Ref. to AB-22, Airbag Control Module.>	Go to step 4.
4 CHECK AIRBAG HARNESS. 1) Disconnect the connector (7U) and (8U) in step 3 condition. 2) Measure the resistance between connector (4U) in the test harness U and connector (i84). Connector & terminal (4U) No. 16 — (i84) No. 13:	Is the resistance less than 10 Ω ?	Replace body integrated unit.	Repair the bulkhead harness or replace airbag main harness with chassis harness.

Diagnostic Chart with Trouble Code

AIRBAG SYSTEM (DIAGNOSTICS)

V: DTC 41 SIDE AIRBAG RH FAILURE

DTC DETECTING CONDITION:

- Side airbag harness (RH) is faulty.
- Side airbag module (RH) is faulty.
- Airbag control module is faulty.

CAUTION:

- Before diagnosing the airbag system, be sure to turn the ignition switch OFF, disconnect the ground terminal from battery, and wait more than 20 seconds before starting to work.
- Before replacing the airbag module, seat belt pretensioner, roll connector, control module and sensor, reconnect each part and confirm that the warning light operates properly.
- When inspecting the airbag main harness, disconnect the airbag module connector of the driver's and passenger's seats for safety reasons.
- When inspecting the airbag rear harness, disconnect the side airbag module connector, curtain airbag module connector and seat belt pretensioner connector for safety reasons.

WIRING DIAGRAM:

AB-01499

Diagnostic Chart with Trouble Code

AIRBAG SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
1 CHECK POOR CONTACT IN CONNECTOR. Check if there is poor contact in connector between airbag control module, side airbag module RH and side airbag sensor RH.	Is there poor contact?	Replace the airbag rear harness with body harness.	Go to step 2.
2 CHECK SIDE AIRBAG MODULE. 1) Turn the ignition switch OFF, disconnect the battery ground cable, and wait more than 20 seconds. 2) Disconnect the connector (AB25) from (AB24), and connect the connector (1F) in test harness F to connector (AB24). 3) Connect the airbag resistor to the connector (3F) in the test harness F. 4) Connect the battery ground cable and turn the ignition switch ON.	Does the airbag warning light illuminate for 6 seconds and go off?	Replace the side airbag module (RH). <Ref. to AB-18, REMOVAL, Side Airbag Module.>	Go to step 3.
3 CHECK AIRBAG REAR HARNESS (SIDE AIRBAG MODULE HARNESS RH). 1) Turn the ignition switch OFF, disconnect the battery ground cable, and wait more than 20 seconds. 2) Disconnect the connector (AB26) from seat belt pretensioner (RH). 3) Disconnect the connector (AB33) from curtain airbag module (RH). 4) Disconnect the airbag resistor from the test harness F. 5) Disconnect the connector (AB18) from airbag control module. 6) Connect the connector (1U) in the test harness U to connector (AB18). 7) Measure the resistance between connector (3U) in the test harness U and connector (3F) in the test harness F. Connector & terminal (3U) No. 20 — (3F) No. 4: (3U) No. 18 — (3F) No. 3:	Is the resistance less than 10 Ω ?	Go to step 4.	Replace the airbag rear harness with body harness.
4 CHECK AIRBAG REAR HARNESS (SIDE AIRBAG MODULE HARNESS RH). Measure the resistance between connector (3U) terminals in the test harness U. Connector & terminal (3U) No. 20 — (3U) No. 18:	Is the resistance more than 1 M Ω ?	Go to step 5.	Replace the airbag rear harness with body harness.
5 CHECK AIRBAG REAR HARNESS (SIDE AIRBAG MODULE HARNESS RH). Measure the resistance between connector (3U) in the test harness U and chassis ground. Connector & terminal (3U) No. 20 — Chassis ground: (3U) No. 18 — Chassis ground:	Is the resistance more than 1 M Ω ?	Go to step 6.	Replace the airbag rear harness with body harness.
6 CHECK AIRBAG CONTROL MODULE. 1) Connect all the connectors. 2) Erase the memory. 3) Perform the inspection mode. 4) Read the DTC.	Is the same DTC displayed as in the current diagnosis still being output?	Replace the airbag control module. <Ref. to AB-22, Airbag Control Module.>	Go to step 7.

Diagnostic Chart with Trouble Code

AB-01500

Diagnostic Chart with Trouble Code

AIRBAG SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
1 CHECK POOR CONTACT IN CONNECTOR. Check if there is poor contact in connector between airbag control module, side airbag module LH and side airbag sensor LH.	Is there poor contact?	Replace the airbag rear harness with body harness.	Go to step 2.
2 CHECK SIDE AIRBAG MODULE. 1) Turn the ignition switch OFF, disconnect the battery ground cable, and wait more than 20 seconds. 2) Disconnect the connector (AB20) from (AB19), and connect the connector (1F) in test harness F to connector (AB19). 3) Connect the airbag resistor to connector (3F) in the test harness F. 4) Connect the battery ground cable and turn the ignition switch ON.	Does the airbag warning light illuminate for 6 seconds and go off?	Replace the side airbag module (LH). <Ref. to AB-18, REMOVAL, Side Airbag Module.>	Go to step 3.
3 CHECK AIRBAG REAR HARNESS (SIDE AIRBAG MODULE HARNESS LH). 1) Turn the ignition switch OFF, disconnect the battery ground cable, and wait more than 20 seconds. 2) Disconnect the connector (AB21) from seat belt pretensioner (LH). 3) Disconnect the connector (AB31) from curtain airbag module (LH). 4) Disconnect the airbag resistor from test harness. 5) Disconnect the connector (AB17) from airbag control module. 6) Connect the connector (1U) in the test harness U to connector (AB17). 7) Measure the resistance between connector (3U) in the test harness U and connector (3F) in the test harness F. <i>Connector & terminal</i> <i>(3U) No. 12 — (3F) No. 4:</i> <i>(3U) No. 10 — (3F) No. 3:</i>	Is the resistance less than 10 Ω?	Go to step 4.	Replace the airbag rear harness with body harness.
4 CHECK AIRBAG REAR HARNESS (SIDE AIRBAG MODULE HARNESS LH). Measure the resistance between connector (3U) terminals in the test harness U. <i>Connector & terminal</i> <i>(3U) No. 12 — (3U) No. 10:</i>	Is the resistance more than 1 MΩ?	Go to step 5.	Replace the airbag rear harness with body harness.
5 CHECK AIRBAG REAR HARNESS (SIDE AIRBAG MODULE HARNESS LH). Measure the resistance between connector (3U) in the test harness U and chassis ground. <i>Connector & terminal</i> <i>(3U) No. 12 — Chassis ground:</i> <i>(3U) No. 10 — Chassis ground:</i>	Is the resistance more than 1 MΩ?	Go to step 6.	Replace the airbag rear harness with body harness.
6 CHECK AIRBAG CONTROL MODULE. 1) Connect all the connectors. 2) Erase the memory. 3) Perform the inspection mode. 4) Read the DTC.	Is the same DTC displayed as in the current diagnosis still being output?	Replace the airbag control module. <Ref. to AB-22, Airbag Control Module.>	Go to step 7.

AIRBAG SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
5 CHECK FOR ANY OTHER DTC ON DISPLAY.	Is any other DTC displayed?	Inspect the relevant DTC using "List of Diagnostic Trouble Code (DTC)". <Ref. to AB(diag)-41, List of Diagnostic Trouble Code (DTC).>	Finish the diagnosis.

AG:DTC 58 CURTAIN AIRBAG SENSOR RH FAILURE

DTC DETECTING CONDITION:

Curtain airbag sensor (RH) is faulty.

When DTC 58 is displayed, the circuit within the curtain airbag sensor (RH) is faulty. Replace the curtain airbag sensor (RH). <Ref. to AB-24, Curtain Airbag Sensor.>

AH:DTC 59 CURTAIN AIRBAG SENSOR LH FAILURE

DTC DETECTING CONDITION:

Curtain airbag sensor (LH) is faulty.

When DTC 59 is displayed, the circuit within the curtain airbag sensor (LH) is faulty. Replace the curtain airbag sensor (LH). <Ref. to AB-24, Curtain Airbag Sensor.>

Diagnostic Chart with Trouble Code

AIRBAG SYSTEM (DIAGNOSTICS)

AI: DTC 61 BELT PRETENSIONER RH FAILURE

DTC DETECTING CONDITION:

- Seat belt pretensioner (RH) circuit is open, shorted or shorted to ground.
- Airbag control module is faulty.
- Pretensioner is faulty.
- Pretensioner harness is faulty.

CAUTION:

- Before diagnosing the airbag system, be sure to turn the ignition switch OFF, disconnect the ground terminal from battery, and wait more than 20 seconds before starting to work.
- Before replacing the airbag module, seat belt pretensioner, roll connector, control module and sensor, reconnect each part and confirm that the warning light operates properly.
- When inspecting the airbag rear harness, disconnect the side airbag module connector, curtain airbag module connector and seat belt pretensioner connector for safety reasons.

WIRING DIAGRAM:

AB-00925

Diagnostic Chart with Trouble Code

AIRBAG SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
1 CHECK POOR CONTACT IN CONNECTOR. Check if there is poor contact in connector between airbag control module and seat belt pretensioner RH.	Is there poor contact?	Replace the airbag rear harness with body harness.	Go to step 2.
2 CHECK SEAT BELT PRETENSIONER. 1) Turn the ignition switch OFF, disconnect the battery ground cable, and wait more than 20 seconds. 2) Disconnect the connector (AB26) from seat belt pretensioner (RH). 3) Connect the connector (1N) in the test harness N to connector (AB26). 4) Connect the airbag resistor to connector (2N) in the test harness N. 5) Connect the battery ground cable and turn the ignition switch ON.	Does the airbag warning light illuminate for 6 seconds and go off?	Replace the seat belt pretensioner (RH). <Ref. to SB-10, Front Seat Belt.>	Go to step 3.
3 CHECK AIRBAG REAR HARNESS (PRE-TENSIONER HARNESS RH). 1) Turn the ignition switch OFF, disconnect the battery ground cable, and wait more than 20 seconds. 2) Disconnect the airbag resistor from test harness. 3) Disconnect the connector (AB24) from side airbag module (RH). 4) Disconnect the connector (AB33) from curtain airbag module (RH). 5) Disconnect the connectors (AB17) and (AB18) from airbag control modules. 6) Connect the connector (1U) in the test harness U to connector (AB18). 7) Measure the resistance between connector (3U) in the test harness U and connector (2N) in the test harness N. <i>Connector & terminal</i> <i>(3U) No. 17 — (2N) No. 2:</i> <i>(3U) No. 19 — (2N) No. 1:</i>	Is the resistance less than 10 Ω ?	Go to step 4.	Replace the airbag rear harness with body harness.
4 CHECK AIRBAG REAR HARNESS (PRE-TENSIONER HARNESS RH). Measure the resistance between connector (3U) terminals in the test harness U. <i>Connector & terminal</i> <i>(3U) No. 19 — (3U) No. 17:</i>	Is the resistance more than 1 M Ω ?	Go to step 5.	Replace the airbag rear harness with body harness.
5 CHECK AIRBAG REAR HARNESS (PRE-TENSIONER HARNESS RH). Measure the resistance between connector (3U) in the test harness U and chassis ground. <i>Connector & terminal</i> <i>(3U) No. 17 — Chassis ground:</i> <i>(3U) No. 19 — Chassis ground:</i>	Is the resistance more than 1 M Ω ?	Go to step 6.	Replace the airbag rear harness with body harness.
6 CHECK AIRBAG CONTROL MODULE. 1) Connect all the connectors. 2) Erase the memory. 3) Perform the inspection mode. 4) Read the DTC.	Is the same DTC displayed as in the current diagnosis still being output?	Replace the airbag control module. <Ref. to AB-22, Airbag Control Module.>	Go to step 7.

Diagnostic Chart with Trouble Code

1 CHECK POOR CONTACT IN CONNECTOR. Check if there is poor contact in connector between airbag control module and passenger's airbag module.	Is there poor contact?	Replace the airbag main harness with body harness.	Go to step 2.
2 CHECK PASSENGER'S AIRBAG MODULE. 1) Turn the ignition switch OFF, disconnect the battery ground cable, and wait more than 20 seconds. 2) Remove the instrument panel side cover on the passenger's side. 3) Disconnect the connector (AB10) from (AB9). 4) Connect the connector (1P) in the test harness P to connector (AB9). 5) Connect the airbag resistor to connector (2P) and (3P) in the test harness P. 6) Connect the battery ground cable and turn the ignition switch ON.	Does the airbag warning light illuminate for 6 seconds and go off?	Replace the passenger airbag module. <Ref. to AB-17, Passenger's Airbag Module.>	Go to step 3.
3 CHECK AIRBAG MAIN HARNESS (PASSENGER'S AIRBAG HARNESS). 1) Turn the ignition switch OFF, disconnect the battery ground cable, and wait more than 20 seconds. 2) Disconnect the airbag resistor from connector (2P) and (3P) in the test harness P. 3) Remove the instrument panel lower cover, disconnect the connector (AB7) from (AB2). 4) Disconnect the connector (AB6) from airbag control module, and connect the connector (1U) in the test harness U. 5) Measure the voltage between connector (2U) in the test harness U and chassis ground. Connector & terminal <i>(2U) No. 3 (+) — Chassis ground (-):</i> <i>(2U) No. 5 (+) — Chassis ground (-):</i> <i>(2U) No. 9 (+) — Chassis ground (-):</i> <i>(2U) No. 13 (+) — Chassis ground (-):</i>	Is the voltage less than 1 V?	Go to step 4.	Replace the airbag main harness with body harness.
4 CHECK AIRBAG CONTROL MODULE. 1) Connect all the connectors. 2) Erase the memory. 3) Perform the inspection mode. 4) Read the DTC.	Is the same DTC displayed as in the current diagnosis still being output?	Replace the airbag control module. <Ref. to AB-22, Airbag Control Module.>	Go to step 5.
5 CHECK FOR ANY OTHER DTC ON DISPLAY.	Is any other DTC displayed?	Inspect the relevant DTC using "List of Diagnostic Trouble Code (DTC)". <Ref. to AB(diag)-41, List of Diagnostic Trouble Code (DTC).>	Finish the diagnosis.

Diagnostic Chart with Trouble Code

AIRBAG SYSTEM (DIAGNOSTICS)

AQ:DTC 91 CURTAIN AIRBAG MODULE RH FAILURE

DTC DETECTING CONDITION:

- Curtain airbag harness (RH) is faulty.
- Curtain airbag module (RH) is faulty.
- Airbag control module is faulty.

CAUTION:

- Before diagnosing the airbag system, be sure to turn the ignition switch OFF, disconnect the ground terminal from battery, and wait more than 20 seconds before starting to work.
- Before replacing the airbag module, seat belt pretensioner, roll connector, control module and sensor, reconnect each part and confirm that the warning light operates properly.
- When inspecting the airbag rear harness, disconnect the side airbag module connector, curtain airbag module connector and seat belt pretensioner connector for safety reasons.

WIRING DIAGRAM:

AB-01501

Diagnostic Chart with Trouble Code

AIRBAG SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
1 CHECK POOR CONTACT IN CONNECTOR. Check if there is poor contact in connector between airbag control module, curtain airbag module RH and curtain airbag sensor RH.	Is there poor contact?	Replace the airbag rear harness with body harness.	Go to step 2.
2 CHECK CURTAIN AIRBAG MODULE. 1) Turn the ignition switch OFF, disconnect the battery ground cable, and wait more than 20 seconds. 2) Disconnect the connector (AB33) from (AB40), and connect the connector (1F) in test harness F to connector (AB33). 3) Connect the airbag resistor to connector (3F) in the test harness F. 4) Connect the battery ground cable and turn the ignition switch ON.	Does the airbag warning light illuminate for 6 seconds and go off?	Replace the curtain airbag module (RH). <Ref. to AB-20, Curtain Airbag Module.>	Go to step 3.
3 CHECK AIRBAG REAR HARNESS (CURTAIN AIRBAG MODULE HARNESS RH). 1) Turn the ignition switch OFF, disconnect the battery ground cable, and wait more than 20 seconds. 2) Disconnect the connector (AB26) from seat belt pretensioner (RH). 3) Disconnect the connector (AB24) from side airbag module (RH). 4) Disconnect the airbag resistor from the test harness F. 5) Disconnect the connector (AB18) from airbag control module. 6) Connect the connector (1U) in the test harness U to connector (AB18). 7) Measure the resistance between connector (5U) in the test harness U and connector (3F) in the test harness F. <i>Connector & terminal</i> <i>(5U) No. 6 — (3F) No. 4:</i> <i>(5U) No. 8 — (3F) No. 3:</i>	Is the resistance less than 10 Ω ?	Go to step 4.	Replace the airbag rear harness with body harness.
4 CHECK AIRBAG REAR HARNESS (CURTAIN AIRBAG MODULE HARNESS RH). Measure the resistance between connector (5U) terminals in the test harness U. <i>Connector & terminal</i> <i>(5U) No. 6 — (5U) No. 8:</i>	Is the resistance more than 1 M Ω ?	Go to step 5.	Replace the airbag rear harness with body harness.
5 CHECK AIRBAG REAR HARNESS (CURTAIN AIRBAG MODULE HARNESS RH). Measure the resistance between connector (5U) in the test harness U and chassis ground. <i>Connector & terminal</i> <i>(5U) No. 6 — Chassis ground:</i> <i>(5U) No. 8 — Chassis ground:</i>	Is the resistance more than 1 M Ω ?	Go to step 6.	Replace the airbag rear harness with body harness.
6 CHECK AIRBAG CONTROL MODULE. 1) Connect all the connectors. 2) Erase the memory. 3) Perform the inspection mode. 4) Read the DTC.	Is the same DTC displayed as in the current diagnosis still being output?	Replace the airbag control module. <Ref. to AB-22, Airbag Control Module.>	Go to step 7.

Diagnostic Chart with Trouble Code

7	CHECK FOR ANY OTHER DTC ON DISPLAY.	Is any other DTC displayed?	Inspect the relevant DTC using "List of Diagnostic Trouble Code (DTC)". <Ref. to AB(diag)-41, List of Diagnostic Trouble Code (DTC).>	Finish the diagnosis.

Diagnostic Chart with Trouble Code

AIRBAG SYSTEM (DIAGNOSTICS)

AR:DTC 92 CURTAIN AIRBAG MODULE LH FAILURE

DTC DETECTING CONDITION:

- Curtain airbag harness (LH) is faulty.
- Curtain airbag module (LH) is faulty.
- Airbag control module is faulty.

CAUTION:

- Before diagnosing the airbag system, be sure to turn the ignition switch OFF, disconnect the ground terminal from battery, and wait more than 20 seconds before starting to work.
- Before replacing the airbag module, seat belt pretensioner, roll connector, control module and sensor, reconnect each part and confirm that the warning light operates properly.
- When inspecting the airbag main harness, disconnect the airbag module connector of the driver's and passenger's seats for safety reasons.
- When inspecting the airbag rear harness, disconnect the side airbag module connector, curtain airbag module connector and seat belt pretensioner connector for safety reasons.

WIRING DIAGRAM:

AB-01502

Diagnostic Chart with Trouble Code

AIRBAG SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
1 CHECK POOR CONTACT IN CONNECTOR. Check if there is poor contact in connector between airbag control module, curtain airbag module LH and curtain airbag sensor LH.	Is there poor contact?	Replace the airbag rear harness with body harness.	Go to step 2.
2 CHECK CURTAIN AIRBAG MODULE. 1) Turn the ignition switch OFF, disconnect the battery ground cable, and wait more than 20 seconds. 2) Disconnect the connector (AB31) from (AB39), and connect the connector (1F) in test harness F to connector (AB31). 3) Connect the airbag resistor to connector (3F) in the test harness F. 4) Connect the battery ground cable and turn the ignition switch ON.	Does the airbag warning light illuminate for 6 seconds and go off?	Replace the curtain airbag module (LH). <Ref. to AB-20, Curtain Airbag Module.>	Go to step 3.
3 CHECK AIRBAG REAR HARNESS (CURTAIN AIRBAG MODULE HARNESS LH). 1) Turn the ignition switch OFF, disconnect the battery ground cable, and wait more than 20 seconds. 2) Disconnect the connector (AB21) from seat belt pretensioner (LH). 3) Disconnect the connector (AB19) from side airbag module (LH). 4) Disconnect the airbag resistor from the test harness F. 5) Disconnect the connector (AB17) from airbag control module. 6) Connect the connector (1U) in the test harness U to connector (AB17). 7) Measure the resistance between connector (5U) in the test harness U and connector (3F) in the test harness F. <i>Connector & terminal</i> <i>(5U) No. 1 — (3F) No. 3:</i> <i>(5U) No. 3 — (3F) No. 4:</i>	Is the resistance less than 10 Ω?	Go to step 4.	Replace the airbag rear harness with body harness.
4 CHECK AIRBAG REAR HARNESS (CURTAIN AIRBAG MODULE HARNESS LH). Measure the resistance between connector (5U) terminals in the test harness U. <i>Connector & terminal</i> <i>(5U) No. 1 — (5U) No. 3:</i>	Is the resistance more than 1 MΩ?	Go to step 5.	Replace the airbag rear harness with body harness.
5 CHECK AIRBAG REAR HARNESS (CURTAIN AIRBAG MODULE HARNESS LH). Measure the resistance between connector (5U) in the test harness U and chassis ground. <i>Connector & terminal</i> <i>(5U) No. 1 — Chassis ground:</i> <i>(5U) No. 3 — Chassis ground:</i>	Is the resistance more than 1 MΩ?	Go to step 6.	Replace the airbag rear harness with body harness.
6 CHECK AIRBAG CONTROL MODULE. 1) Connect all the connectors. 2) Erase the memory. 3) Perform the inspection mode. 4) Read the DTC.	Is the same DTC displayed as in the current diagnosis still being output?	Replace the airbag control module. <Ref. to AB-22, Airbag Control Module.>	Go to step 7.

Diagnostic Chart with Trouble Code

Basic Diagnostic Procedure

OCCUPANT DETECTION SYSTEM (DIAGNOSTICS)

1. Basic Diagnostic Procedure

A: PROCEDURE

NOTE:

Refer to "Check List for Interview". <Ref. to OD(diag)-4, Check List for Interview.>

Step	Check	Yes	No
1 CHECK PRE-INSPECTION. 1) Ask the customer when and how the trouble occurred using the interview checklist. <Ref. to OD(diag)-4, Check List for Interview.> 2) Before performing diagnostics, check the components which might affect OD problems. <Ref. to OD(diag)-5, INSPECTION, General Description.>	Is the component that might influence the OD problem normal?	Go to step 2.	Repair or replace each component.
2 CHECK INDICATION OF DTC. 1) Turn the ignition switch to OFF. 2) Connect the Subaru Select Monitor to data link connector. 3) Turn the ignition switch to ON, and Subaru Select Monitor switch to ON. 4) Read the DTC. <Ref. to OD(diag)-18, OPERATION, Read Diagnostic Trouble Code (DTC).> NOTE: If the communication function of the Subaru Select Monitor cannot be executed normally, check the communication circuit. <Ref. to OD(diag)-14, COMMUNICATION FOR INITIALIZING IMPOSSIBLE, INSPECTION, Subaru Select Monitor.> 5) Record all the DTCs and freeze frame data.	Is DTC displayed?	Go to step 4.	Go to step 3.
3 PERFORM GENERAL DIAGNOSTICS. 1) Inspect using "General Diagnostic Table". <Ref. to OD(diag)-29, INSPECTION, General Diagnostic Table.> 2) Perform the clear memory mode. <Ref. to OD(diag)-20, OPERATION, Clear Memory Mode.> 3) Perform the inspection mode. <Ref. to OD(diag)-19, PROCEDURE, Inspection Mode.> 4) Read the DTC. <Ref. to OD(diag)-18, OPERATION, Read Diagnostic Trouble Code (DTC).> 5) Check the DTC does not displayed.	Do the OD warning light and airbag warning light go off after starting the engine?	Finish the diagnosis.	Check the combination meter circuit. <Ref. to OD(diag)-21, Diagnostic Procedure when Airbag Warning Light Illuminated.>

Basic Diagnostic Procedure

OCCUPANT DETECTION SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
<p>4</p> <p>PERFORM DIAGNOSIS.</p> <p>1) Refer to "List of Diagnostic Trouble Code (DTC)".</p> <p>NOTE: For the DTC list, refer to the "List of Diagnostic Trouble Code (DTC)". <Ref. to OD(diag)-22, LIST, List of Diagnostic Trouble Code (DTC).></p> <p>2) Correct the faulty part.</p> <p>3) Perform the clear memory mode. <Ref. to OD(diag)-20, OPERATION, Clear Memory Mode.></p> <p>4) Perform the inspection mode. <Ref. to OD(diag)-19, PROCEDURE, Inspection Mode.></p> <p>5) Read the DTC. <Ref. to OD(diag)-18, OPERATION, Read Diagnostic Trouble Code (DTC).></p>	Is DTC displayed?	Repeat the step 4 until no more DTC is shown.	Finish the diagnosis.

Check List for Interview

	Front Left		
	Front Right		
	Wsum		

* Measure the sensor output value with the same seat position as system calibration.

General Description

OCCUPANT DETECTION SYSTEM (DIAGNOSTICS)

3. General Description

A: CAUTION

1. SRS AIRBAG SYSTEM

CAUTION:

- All the airbag system wiring harnesses and connectors are colored yellow. Do not use the electrical test equipment on these circuits.
- Be careful not to damage the airbag system wiring harness and connector when servicing the occupant detection system.

B: INSPECTION

Before performing diagnosis, check the following items which might affect the occupant detection system problems.

C: PREPARATION TOOL

1. SPECIAL TOOL

1. BATTERY

Measure the battery voltage and specific gravity of electrolyte, and check the electrolyte amount.

Standard voltage:

12 V, or more

Specific gravity:

1.260, or more

Electrolyte:

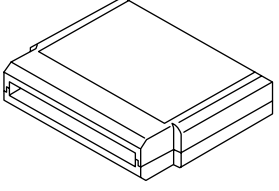

Between the upper level and lower level

2. AIRBAG SYSTEM

Read the DTC of airbag system, and check that there is no malfunction in airbag system.

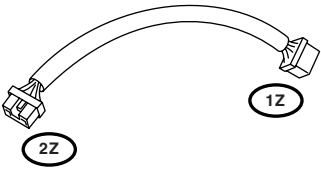

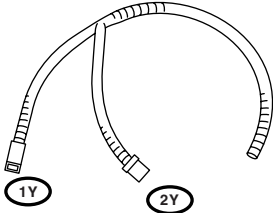

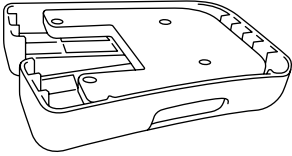

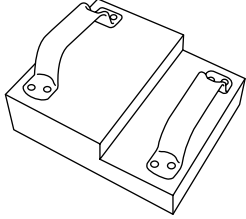

Standard:

DTC is not displayed.

TOOL NAME	REMARKS
Circuit tester	Used for measuring resistance, voltage and current.

Electrical Component Location

OCCUPANT DETECTION SYSTEM (DIAGNOSTICS)

4. Electrical Component Location

A: LOCATION

- (1) Occupant detection control module
- (2) Load cell sensor
- (3) Airbag ON/OFF indicator light
- (4) Buckle switch (Passenger's seat)

Control Module I/O Signal

OCCUPANT DETECTION SYSTEM (DIAGNOSTICS)

5. Control Module I/O Signal

A: ELECTRICAL SPECIFICATION

CAUTION:

Never disassemble or disconnect the control module, load cell sensor or coupling harness, since each component of occupant detection system is assembled as seat frame assembly. (Disconnection from body harness connector, and disconnection of side airbag, buckle switch and power seat circuit connector are OK.)

Terminal Name	Terminal No.	Input/Output value	Remarks	
Battery voltage	26	9 — 16 V	Always	
Ignition – SW	12	9 — 16 V	When ignition switch ON	
Airbag control module communication (COM)	13	Open collector terminal	Communication line	
Airbag control module communication (GND)	24	0 V	Communication line	
Load cell sensor 1	(Vcc)	8	0 — 5 V	Load cell sensor power supply
	(Vout)	7	0.5 — 4.5 V	Sensor output voltage
	(GND)	20	0 V	Sensor ground
Load cell sensor 2	(Vcc)	6	0 — 5 V	Load cell sensor power supply
	(Vout)	5	0.5 — 4.5 V	Sensor output voltage
	(GND)	18	0 V	Sensor ground
Load cell sensor 3	(Vcc)	4	0 — 5 V	Load cell sensor power supply
	(Vout)	3	0.5 — 4.5 V	Sensor output voltage
	(GND)	16	0 V	Sensor ground
Load cell sensor 4	(Vcc)	2	0 — 5 V	Load cell sensor power supply
	(Vout)	1	0.5 — 4.5 V	Sensor output voltage
	(GND)	14	0 V	Sensor ground
Buckle switch	9	0 — Ignition voltage	Ignition voltage when switch ON	
Buckle switch (GND)	22	0 V	Switch ground	
Subaru Select Monitor communication	11	Serial communication		

Control Module I/O Signal

OCCUPANT DETECTION SYSTEM (DIAGNOSTICS)

B: WIRING DIAGRAM

- (1) Battery power supply
- (2) Ignition power supply
- (3) Airbag control module

- (4) Airbag control module communication line
- (5) Subaru select monitor

- (6) Occupant detection control module
- (7) Occupant detection sensor 1 — 4
- (8) Seat belt buckle RH

Subaru Select Monitor

OCCUPANT DETECTION SYSTEM (DIAGNOSTICS)

6. Subaru Select Monitor

A: OPERATION

1. READ DIAGNOSTIC TROUBLE CODE (DTC)

1) Prepare the Subaru Select Monitor kit. <Ref. to OD(diag)-5, SPECIAL TOOL, PREPARATION TOOL, General Description.>

2) Connect the diagnosis cable to Subaru Select Monitor.

3) Insert the cartridge to Subaru Select Monitor. <Ref. to OD(diag)-5, SPECIAL TOOL, PREPARATION TOOL, General Description.>

4) Connect the Subaru Select Monitor to data link connector.

(1) Data link connector is located in the lower portion of instrument panel (on the driver's side).

(1) Data link connector

(2) Connect the diagnosis cable to data link connector.

CAUTION:

Do not connect the scan tools except for Subaru Select Monitor.

5) Turn the ignition switch to ON (engine OFF) and Subaru Select Monitor switch to ON.

(1) Power switch

6) On the «Main Menu» display screen, select the {Each System Check} and press the [YES] key.

7) On the «System Selection Menu» display screen, select the {Occupant Sensing System} and press the [YES] key.

8) Press the [YES] key after the {Occupant Sensing System} is displayed.

9) On the «Occupant Sensing System» display screen, select the {DTC Display} and press the [YES] key.

NOTE:

- For details concerning operation procedure, refer to “SUBARU SELECT MONITOR OPERATION MANUAL”.

- For details concerning DTCs, refer to the “List of Diagnostic Trouble Code (DTC)”. <Ref. to OD(diag)-22, List of Diagnostic Trouble Code (DTC).>

- Display all the DTCs detected.

- If a particular DTC is not properly stored in memory (due to a drop in occupant detection control module power supply, etc.) on the occurrence of a problem, the DTC which is suffixed with a question mark appears on the Subaru Select Monitor display. This shows it may be an unreliable reading.

10) If the occupant detection control module cannot communicate with Subaru Select Monitor, check the communication circuit. <Ref. to OD(diag)-14, COMMUNICATION FOR INITIALIZING IMPOSSIBLE, INSPECTION, Subaru Select Monitor.>

11) When DTC is not displayed, check the meter circuit or select monitor communication circuit. <Ref. to OD(diag)-14, INSPECTION, Subaru Select Monitor.>

Subaru Select Monitor

OCCUPANT DETECTION SYSTEM (DIAGNOSTICS)

2. SENSOR DATA OUTPUT

1) On the «Occupant Sensing System» main menu display screen, select the {Sensor Data Output} and press the [YES] key.

NOTE:

Do not touch the vehicle within 20 seconds after pressing the [YES] key. Output value may be changed when sensing the pitching and vibration of the vehicle while reading sensor data output.

2) Sensor output will be displayed in the (*****). Press the [YES] key to move to the main menu.

3. CLEAR MEMORY MODE

1) Select the {Occupant Sensing System} from the main menu, and press the [YES] key.

2) On the «Occupant Sensing System» display screen, select the {Clear Memory} and press the [YES] key.

3) When the {Done} is shown on the display, DTCs will be erased.

NOTE:

When the {Cannot erase the DTC stored, perform the diagnosis according to trouble symptom} is shown, read the DTC and perform the diagnosis according to DTC.

4. SYSTEM CALIBRATION

CAUTION:

- When a trouble is occurred during the system calibration resulting in interruption of sensor data output, the DTC 28 {Adjustment / Inspection halt} of occupant detection system will be detected to illuminate the airbag warning light. In this case, perform the system calibration again, or perform the system calibration again after repairing the trouble cause.

- Compartment temperature during the system calibration must be within 0 — 40°C.

- 1) Park the vehicle on a level surface.
- 2) Unload the cargo and set the vehicle in curb weight condition.
- 3) Connect the Subaru Select Monitor to vehicle, and then turn the ignition switch to ON.
- 4) Turn the Subaru Select Monitor switch to ON.

5) On the «Main Menu» display screen, select the {Each System Check} and press the [YES] key.

6) On the «System Selection Menu» display screen, select the {Occupant Sensing System} and press the [YES] key.

7) After the {2005 LOAD CELL TYPE OCCUPANT DETECTION SYSTEM Press the [YES] key} is displayed, check the model year and press the [YES] key.

8) On the {OCCUPANT DETECTION SYSTEM} display screen, select the {1.System Calibration} and press the [YES] key.

9) When the {Complete all calibration checks, illuminated and a trouble code saved. Continue: "YES", Quit: "NO"} is displayed, press the [YES] key.

10) When the {Diagnostic code check No trouble Continue: "YES", Quit: "NO"} is displayed, press the [YES] key.

NOTE:

When a DTC is detected, {Diagnostic code check some troubles occur See service manual Press "YES" to END} is displayed. Inspect the DTC, and perform the calibration again after repairing trouble cause.

11) When the {Empty the passenger seat Continue: "YES", Quit: "NO"} is displayed, empty the passenger's seat and press the [YES] key.

12) When the {Adjust the passenger seat to the condition shown in Service manual Continue: "YES", Quit: "NO"} is displayed, slide the passenger's seat to the rear most and lock it securely, and lock the backrest in the fore most securely, then press the [YES] key. (For the model with power seat, operate the slide switch or reclining switch fully until no longer moved.)

NOTE:

- After pressing the [YES] key, "Now processing ...Wait for a while. Do not touch or give impact to vehicle and seat" is displayed. Do not touch the vehicle within 20 seconds while the message is displayed.
- When the {System calibration is unsuccessful See service manual Press "YES" to END} is displayed, go to step 19.

Subaru Select Monitor

OCCUPANT DETECTION SYSTEM (DIAGNOSTICS)

13) When the {Threshold adjustment Is success fully completed weight inspection in service manual continue: "YES", Quit: "NO"} is displayed, press the [YES] key.

14) When the {Empty the passenger seat Continue: "YES", Quit: "NO"} is displayed, make sure the passenger's seat is empty and press the [YES] key.

15) When the {Adjust the passenger seat to the condition shown with service manual Continue: "YES", Quit: "NO"} is displayed, check the seat position and press the [YES] key.

NOTE:

- Slide the seat to the rearmost position and lock it securely. Lock the backrest securely in the front most position. (For the model with power seat, operate the slide switch or reclining switch fully until no longer moved.)
- Diagnostic trouble code (DTC) is input when selecting the "NO" in this step.
- After pressing the [YES] key, "Now processing ...Wait for a while. Do not touch or give impact to vehicle and seat" is displayed. Do not touch the vehicle within 20 seconds while the message is displayed.
- When the {System calibration is unsuccessful See service manual Press "YES" to END} is displayed, go to step 19.

16) {input threshold weight mass (lbs) [00.0] Press "YES" After inputting weight mass} is displayed. Input the weight amount (79.1 lbs) and press the [YES] key.

NOTE:

When an incorrect weight amount is entered, error will be generated and the DTC will be input.

17) {Put threshold weight with the position on the passenger seat shown with service manual Continue: "YES", Quit: "NO"} is displayed. Check the seat position, assemble the weight A and weight B, and then press the [YES] key.

ST1 98399AG000 SPECIAL TOOL WEIGHT A
ST2 98399AG010 SPECIAL TOOL WEIGHT B

NOTE:

- DTC is detected when selecting the "NO" in this step.

- Place the weight in the seat center, making sure the firm contact with the backrest.
- Do not touch or give any impact to the vehicle within 20 seconds after pressing the [YES] key.
- When the {System calibration is unsuccessful See service manual Press "YES" to END} is displayed, go to step 19.

18) When the {System calibration Is successfully completed Press "YES" to END} is displayed, press the [YES] key to finish the diagnosis.

19) When the {System calibration is unsuccessful See service manual Press "YES" to END} is displayed, the system is malfunctioning. Turn the ignition switch to OFF once. Read the DTC, repair the trouble cause, and then perform the system calibration again. <Ref. to OD(diag)-18, Read Diagnostic Trouble Code (DTC).> <Ref. to OD(diag)-22, List of Diagnostic Trouble Code (DTC).>

CAUTION:

If the system adjustment fails and stop the operation, DTC {Adjustment / Inspection halt} will be recorded and airbag warning light will illuminate. If the DTC except {Adjustment / Inspection halt} is displayed, calibrate the system after the malfunction is repaired.

Subaru Select Monitor

OCCUPANT DETECTION SYSTEM (DIAGNOSTICS)

B: INSPECTION

1. COMMUNICATION FOR INITIALIZING IMPOSSIBLE

DETECTING CONDITION:

Defective harness connector

TROUBLE SYMPTOM:

Communication is impossible between occupant detection control module and Subaru Select Monitor.

WIRING DIAGRAM:

Subaru Select Monitor

OCCUPANT DETECTION SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No	
1	CHECK IGNITION SWITCH.	Is the ignition switch ON?	Go to step 2.	Turn the ignition switch to ON, and select the occupant detection system mode using Subaru Select Monitor.
2	CHECK BATTERY. 1) Turn the ignition switch to OFF. 2) Measure the battery voltage.	Is the voltage 11 V or more?	Go to step 3.	Charge or replace the battery.
3	CHECK BATTERY TERMINAL.	Is there poor contact at battery terminal?	Repair or tighten the battery terminal.	Go to step 4.
4	CHECK SUBARU SELECT MONITOR COMMUNICATION. 1) Turn the ignition switch to ON. 2) Using the Subaru Select Monitor, check whether communication to other system can be executed normally.	Are the system name and model year displayed on Subaru Select Monitor?	Go to step 8.	Go to step 5.
5	CHECK OCCUPANT DETECTION CONTROL MODULE CONNECTOR. Turn the ignition switch to OFF.	Is the occupant detection control module connectors and body harness connectors are connected securely?	Go to step 6.	Connect the occupant detection control module connector and body harness connector.
6	CHECK SUBARU SELECT MONITOR COMMUNICATION. 1) Turn the ignition switch to OFF. 2) Disconnect the occupant detection control module connector. 3) Turn the ignition switch to ON. 4) Check whether communication to other systems can be executed normally.	Are the system name and model year displayed on Subaru Select Monitor?	Replace the seat cushion frame assembly. <Ref. to SE-9, REMOVAL, Front Seat.>	Go to step 7.
7	CHECK HARNESS CONNECTOR BETWEEN EACH CONTROL UNIT AND DATA LINK CONNECTOR. 1) Turn the ignition switch to OFF. 2) Disconnect the occupant detection control module connector (R212). 3) Measure the resistance between data link connector and chassis ground. Connector & terminal (B40) No. 10 — Chassis ground:	Is the resistance more than 1 MΩ?	Go to step 8.	Check harness and connector between each control unit and data link connector.
8	CHECK THE OUTPUT SIGNAL FOR OCCUPANT DETECTION CONTROL MODULE. 1) Turn the ignition switch to OFF. 2) Measure the voltage between occupant detection control module and chassis ground. Connector & terminal (B40) No. 10 (+) — Chassis ground (-):	Is the voltage less than 1 V?	Go to step 9.	Repair and replace the harness connector between each control unit and data link connector.
9	CHECK HARNESS CONNECTOR BETWEEN OCCUPANT DETECTION CONTROL MODULE AND DATA LINK CONNECTOR. Measure the resistance between occupant detection control module connector and data link connector. Connector & terminal (R212) No. 2 — (B40) No. 10:	Is the resistance less than 0.5 Ω?	Go to step 10.	Repair and replace the harness connector between occupant detection control module and data link connector.

Subaru Select Monitor

OCCUPANT DETECTION SYSTEM (DIAGNOSTICS)

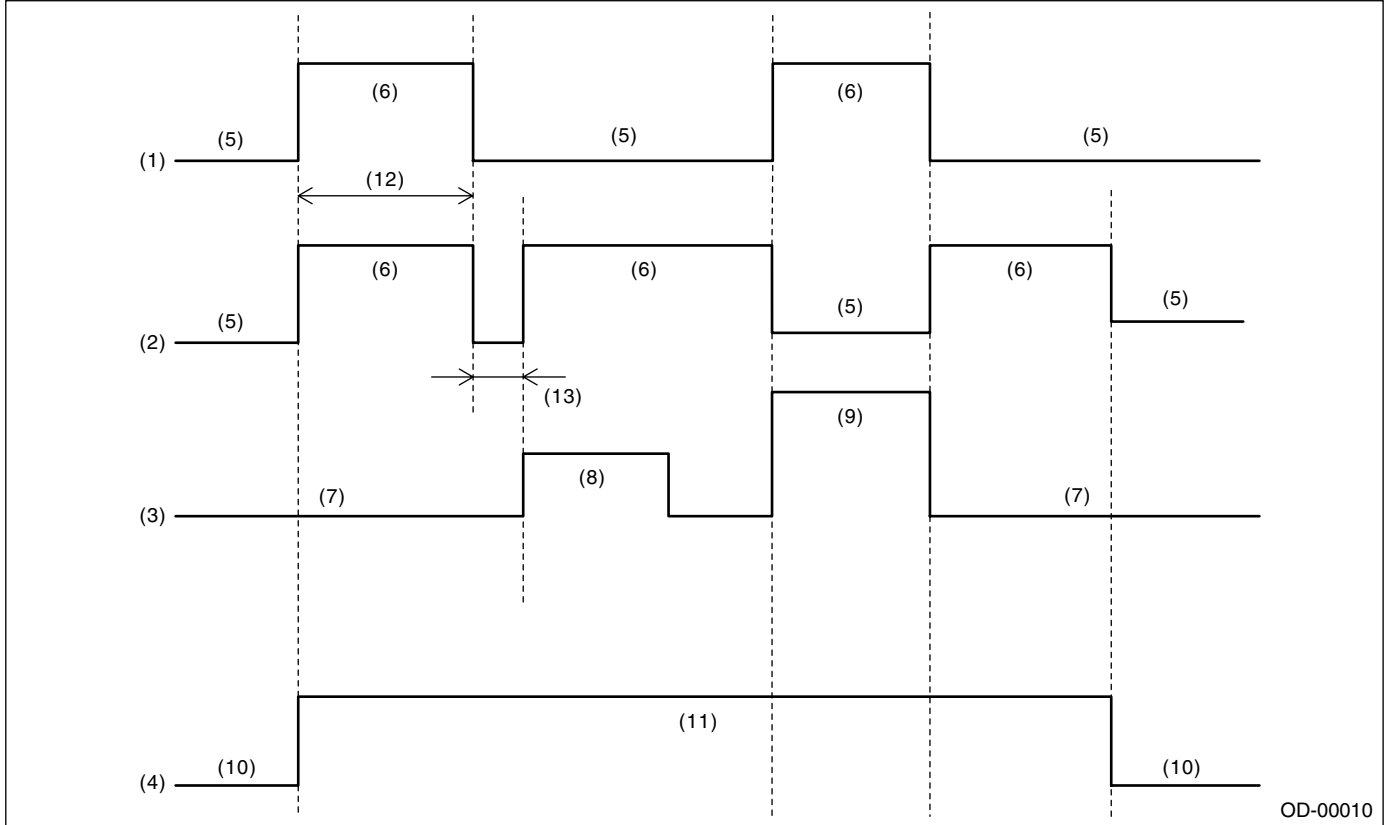

Step	Check	Yes	No
10 CHECK POWER SUPPLY CIRCUIT. 1) Disconnect connector (AB53) from vehicle harness. 2) Connect the test harness Z (AB53) to connector. 3) Turn the ignition switch to ON. (Engine OFF) 4) Measure the voltage between connector (2Z) in the test harness Z and chassis ground. Connector & terminal (2Z) No. 2 (+) — Chassis ground (-):	Is the voltage 10 V or more?	Go to step 11.	Repair or replace the vehicle harness.
11 CHECK HARNESS CONNECTOR BETWEEN OCCUPANT DETECTION CONTROL MODULE AND CHASSIS GROUND. 1) Turn the ignition switch to OFF. 2) Measure the resistance between connector (2Z) in the test harness Z and chassis ground. Connector & terminal (2Z) No. 1 — Chassis ground:	Is the resistance less than 10 Ω ?	Go to step 12.	Repair or replace the body harness.
12 CHECK POOR CONTACT IN CONNECTORS.	Is there poor contact in control module power supply, ground circuit and data link connector?	Replace the airbag harness.	Replace the seat cushion frame assembly. <Ref. to SE-9, REMOVAL, Front Seat.>

Passenger's Airbag ON/OFF Indicator Light Illumination Pattern

OCCUPANT DETECTION SYSTEM (DIAGNOSTICS)

7. Passenger's Airbag ON/OFF Indicator Light Illumination Pattern

A: INSPECTION

- | | | |
|--|---------------------|---------------------|
| (1) Passenger's airbag ON indicator light | (4) Ignition switch | (9) Adult |
| (2) Passenger's airbag OFF indicator light | (5) Light OFF | (10) OFF |
| (3) Occupant seating | (6) Light ON | (11) ON |
| | (7) Empty | (12) Approx. 6 sec. |
| | (8) Child | (13) Approx. 2 sec. |

NOTE:

After the ignition switch is ON, the passenger's airbag ON/OFF indicator light for both ON and OFF come on for 6 seconds then turn off for 2 seconds, and then either ON or OFF will be illuminated for occupants.

Read Diagnostic Trouble Code (DTC)

OCCUPANT DETECTION SYSTEM (DIAGNOSTICS)

8. Read Diagnostic Trouble Code (DTC)

A: OPERATION

For details about reading of DTCs, refer to the "SUBARU SELECT MONITOR". <Ref. to OD(diag)-11, Subaru Select Monitor.>

9. Inspection Mode

A: PROCEDURE

Recreate the circumstance by referring to the conditions described in the checklist.

CAUTION:

- If any damage is observed for vehicle appearance, repair or replace before performing inspection mode.
- If the airbag has been deployed, repair or replace before performing inspection mode.

Clear Memory Mode

OCCUPANT DETECTION SYSTEM (DIAGNOSTICS)

10. Clear Memory Mode

A: OPERATION

For details concerning DTC clear operation, refer to "Subaru Select Monitor". <Ref. to OD(diag)-11, Subaru Select Monitor.>

Diagnostic Procedure when Airbag Warning Light Illuminated

OCCUPANT DETECTION SYSTEM (DIAGNOSTICS)

11. Diagnostic Procedure when Airbag Warning Light Illuminated

A: INSPECTION

- When a problem has occurred to occupant detection system, the airbag warning light illuminates to notify the occurrence of malfunction.
- Read the DTC of airbag system, and perform the diagnosis of occupant detection system when the DTC of occupant detection system failure is displayed.

	Step	Check	Yes	No
1	CHECK AIRBAG WARNING LIGHT. Turn the ignition switch to ON to check if the airbag warning light illuminates.	Does the airbag warning light illuminates for 6 seconds then go off?	Finish the diagnosis.	Go to step 2.
2	CHECK DTC. Connect the Subaru Select Monitor to data link connector, and read the DTC of airbag system.	Is DTC displayed on Subaru Select Monitor?	Inspect using "Diagnosis procedure with Diagnostic Trouble Code (DTC)" for airbag system. <Ref. to AB(diag)-46, Diagnostic Chart with Trouble Code.>	Go to step 3.
3	CHECK DTC. Read the DTC of occupant detection system using Subaru Select Monitor.	Is the following DTC displayed on Subaru Select Monitor? / Adjustment / Inspection halt / ODS failure / Buckle Switch RH failure	Inspect using "Diagnosis procedure with Diagnostic Trouble Code (DTC)" for occupant detection system. <Ref. to OD(diag)-23, Diagnostic Procedure with Diagnostic Trouble Code (DTC).>	Repair or replace the harness between combination meter and airbag control module.

List of Diagnostic Trouble Code (DTC)

OCCUPANT DETECTION SYSTEM (DIAGNOSTICS)

12. List of Diagnostic Trouble Code (DTC)

A: LIST

DTC No.	Display	Contents of diagnosis	Index No.
29	29 ODS failure	<ul style="list-style-type: none"> • Occupant detection module grounding circuit is faulty. • Control module is faulty. • Load cell sensor is faulty. • Airbag harness is faulty. • Seat harness is faulty. 	<Ref. to OD(diag)-25, DTC 29 ODS FAILURE, Diagnostic Procedure with Diagnostic Trouble Code (DTC).>
37	37 Buckle Switch RH failure	<ul style="list-style-type: none"> • Buckle switch is shorted. • Buckle switch is open. • Seat harness is faulty. • Control module is faulty. 	<Ref. to OD(diag)-26, DTC 37 BUCKLE SWITCH RH FAILURE, Diagnostic Procedure with Diagnostic Trouble Code (DTC).>
29	29 Power supply failure	<ul style="list-style-type: none"> • Seat harness is faulty. • Airbag harness is faulty. • Control module is faulty. • Blown out fuse 	<Ref. to OD(diag)-27, DTC 29 POWER SUPPLY FAILURE, Diagnostic Procedure with Diagnostic Trouble Code (DTC).>
28	28 Adjustment / Inspection halt	<ul style="list-style-type: none"> • Calibration service is incomplete. • Inspection service has been interrupted. • Other diagnostic trouble code is entered. • Seat position is incorrect. • Seat installation is faulty. • Material is stuck around seat. • Adjustment weight is faulty. • Distortion of vehicle floor • Backrest frame assembly is faulty. • Seat cushion frame assembly is faulty. • Out of range for temperature in the vehicle while adjustment. 	<Ref. to OD(diag)-23, DTC 28 ADJUSTMENT / INSPECTION HALT, Diagnostic Procedure with Diagnostic Trouble Code (DTC).>

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

OCCUPANT DETECTION SYSTEM (DIAGNOSTICS)

13. Diagnostic Procedure with Diagnostic Trouble Code (DTC)

A: DTC 28 ADJUSTMENT / INSPECTION HALT

DETECTING CONDITION:

- Seat calibration is incomplete.
- A problem has occurred in the sensor or control module.
- Malfunction occurs on harness.

CAUTION:

If the system calibration or inspection service has been interrupted before completing, the indicator light of airbag system will come on and the DTC will be input.

Step	Check	Yes	No
1 PERFORM SYSTEM CALIBRATION. Perform the system calibration for system using with the Subaru Select Monitor. NOTE: For detail procedure, refer to "System Calibration". <Ref. to OD(diag)-12, SYSTEM CALIBRATION, OPERATION, Subaru Select Monitor.>	Is system calibration completed correctly?	Perform the clear memory mode. <Ref. to OD(diag)-11, Subaru Select Monitor.> Using Subaru Select Monitor, check that the DTC 28 is not output.	Go to step 2.
2 CHECK DTC. Connect the Subaru Select Monitor to data link connector, and read the DTC.	Is DTC except "DTC 28 Adjustment / Inspection halt" displayed on Subaru Select Monitor?	Inspect using "Diagnosis procedure with Diagnostic Trouble Code (DTC)". <Ref. to OD(diag)-23, Diagnostic Procedure with Diagnostic Trouble Code (DTC).>	Go to step 3.
3 CHECK SEAT. NOTE: Remove materials interrupting seat slide or heavy materials in back pocket.	Is there a problem on each part of seat? / Do reclining mechanism and slide mechanism operate smoothly and lock securely? / No transformation, crack and inclination are on each part of seat.	Go to step 4.	Replace problem parts. <Ref. to SE-9, Front Seat.>
4 CHECK SEAT POSITION.	Is the seat set in the same position as the system calibration procedure?	Go to step 5.	Adjust the seat position in system calibration procedure. <Ref. to OD(diag)-12, SYSTEM CALIBRATION, OPERATION, Subaru Select Monitor.>
5 CHECK WEIGHT FOR SYSTEM CALIBRATION.	Is weight for system calibration designated in special tools used?	Go to step 6.	Perform the system calibration using weight for system calibration designated as special tool.

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

OCCUPANT DETECTION SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
6 CHECK SERVICE ENVIRONMENT. Check that service environment (temperature in vehicle) is in the range of 0 — 40°C (32 — 104°F).	Is the temperature in vehicle in the range of specification?	Go to step 7.	Perform the system calibration after the compartment temperature is in the range of specification.
7 CHECK FLOOR PANEL. Check that floor panel at the seat installation has no distortion or damage.	Is there serious distortion or damage on the floor panel?	Go to step 8.	Perform the system calibration after repair for distortion or damage.
8 CHECK CONDITION OF BACKREST INSTALLATION. 1) Loosen the mounting bolt for seat hinge of backrest frame assembly. 2) Retighten to specified torque. <Ref. to SE-9, Front Seat.> 3) Perform the system calibration.	Is system calibration completed correctly?	Finish the diagnosis.	Go to step 9.
9 REPLACE BACKREST FRAME ASSEMBLY. Replace backrest frame assembly and perform the system calibration.	Is system calibration completed correctly?	Finish the diagnosis.	Go to step 10.
10 REPLACE SEAT CUSHION FRAME ASSEMBLY. Replace backrest frame assembly and perform the system calibration.	Is system calibration completed correctly?	Finish the diagnosis.	Go to step 11.
11 INSTALL SPACER KIT. 1) Remove the mounting bolt for seat cushion frame assembly. 2) Install the spacer between RH seat cushion frame assembly and chassis. 3) Using the attached bolt, tighten seat cushion frame assembly to specified torque. <Ref. to SE-9, Front Seat.> 4) Perform the system calibration.	Is system calibration completed correctly?	Finish the diagnosis.	Go to step 12.
12 INSTALL SPACER KIT. 1) Remove spacer and bolt installed in RH side. 2) Install the spacer between LH seat cushion frame assembly and chassis. 3) Using the attached bolt, tighten seat cushion frame assembly to specified torque. <Ref. to SE-9, Front Seat.> 4) Perform the system calibration.	Is the system calibration completed correctly?	Finish the diagnosis.	Perform diagnosis from step 1.

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

OCCUPANT DETECTION SYSTEM (DIAGNOSTICS)

B: DTC 29 ODS FAILURE

DETECTING CONDITION:

- Malfunction is occurred in load cell sensor.
- Malfunction is occurred in occupant detection control module.
- Malfunction is occurred in occupant detection system harness.

CAUTION:

Seat cushion frame assembly is a non-disassemble part.

	Step	Check	Yes	No
1	PERFORM SYSTEM CALIBRATION. <Ref. to OD(diag)-12, SYSTEM CALIBRATION, OPERATION, Subaru Select Monitor.>	Is the system calibration completed correctly?	Go to step 2.	Replace the seat cushion frame assembly. <Ref. to SE-9, REMOVAL, Front Seat.>
2	READ DTC. 1) Using Subaru Select Monitor, clear the memory. <Ref. to OD(diag)-12, CLEAR MEMORY MODE, OPERATION, Subaru Select Monitor.> 2) Read the DTC. <Ref. to OD(diag)-11, READ DIAGNOSTIC TROUBLE CODE (DTC), OPERATION, Subaru Select Monitor.>	Is DTC except DTC29 displayed on Subaru Select Monitor?	Perform the diagnosis according to DTC. <Ref. to OD(diag)-22, List of Diagnostic Trouble Code (DTC).>	Finish the diagnosis.

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

OCCUPANT DETECTION SYSTEM (DIAGNOSTICS)

C: DTC 37 BUCKLE SWITCH RH FAILURE

DETECTING CONDITION:

- Buckle switch circuit is shorted to ground.
- Buckle switch circuit is shorted to power supply.
- Buckle switch circuit is open.

WIRING DIAGRAM

OD-00011

Step	Check	Yes	No
1 CHECK BUCKLE SWITCH (RH). 1) Turn the ignition switch to OFF, disconnect the battery ground cable, and wait more than 20 seconds. 2) Disconnect the seat belt switch connector (R214), connect the connector (1Y) in the test harness Y to connector (AB55). 3) Connect the battery ground cable and turn the ignition switch to ON.	Does the airbag warning light illuminates for 6 seconds then go off?	Replace the buckle switch. <Ref. to SE-10, DISASSEMBLY, Front Seat.>	Replace the seat frame assembly. <Ref. to SE-9, REMOVAL, Front Seat.>

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

OCCUPANT DETECTION SYSTEM (DIAGNOSTICS)

D: DTC 29 POWER SUPPLY FAILURE

DETECTING CONDITION:

- No power is supplied to occupant detection control module.
- Power supply circuit harness is faulty.
- Battery voltage is reduced.

CAUTION:

Seat cushion frame assembly is a non-disassemble part.

WIRING DIAGRAM

OD-00012

Step	Check	Yes	No	
1	CHECK BATTERY.	Is the voltage more than 11 V?	Go to step 2.	Charge or replace the battery.

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

OCCUPANT DETECTION SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
2 CHECK HARNESS. 1) Turn the ignition switch to OFF, disconnect the battery ground cable, and wait more than 20 seconds. 2) Disconnect the connector (AB53) from body harness. 3) Connect the connector (1Z) in the test harness Z to the connector (AB53). 4) Connect the battery ground cable to battery. 5) Measure the voltage between connector (2Z) in the test harness Z and chassis ground. Connector & terminal (1Z) No. 1 (+) — Chassis ground (-):	Is the voltage more than 10 V?	Replace the seat cushion frame assembly. <Ref. to SE-9, REMOVAL, Front Seat.>	Go to step 3.
3 CHECK FUSE. 1) Turn the ignition switch to OFF. 2) Remove the fuse No. 7 and perform visual inspection.	Is the fuse No. 7 blown out?	Replace the fuse.	Repair or replace the body harness.

General Diagnostic Table

OCCUPANT DETECTION SYSTEM (DIAGNOSTICS)

14. General Diagnostic Table

A: INSPECTION

Symptom	Problem parts
Passenger's airbag ON/OFF indicator does not operate.	<ul style="list-style-type: none">• Load cell sensor is faulty.• Airbag ON/OFF indicator is faulty.• Condition of installation for passenger's seat is faulty.• Damage for passenger's seat• Damage for floor panel
Passenger's seat belt warning does not operate properly.	<ul style="list-style-type: none">• Buckle switch is faulty.• Buckle switch harness is faulty.• Occupant detection control module is faulty.• Passenger's seat control module harness is faulty.• Damage for passenger's seat
The airbag warning light comes on.	<ul style="list-style-type: none">• Combination meter is faulty.• Airbag control module is faulty.• Steering roll connector is faulty.• Each airbag module is faulty.

OCCUPANT DETECTION SYSTEM (DIAGNOSTICS)

General Description

SEAT BELT SYSTEM

1. General Description

A: COMPONENT

1. FRONT SEAT BELT

- | | |
|----------------------------|------------------------------|
| (1) Adjustable anchor ASSY | (4) Seat belt retractor |
| (2) Shoulder anchor | (5) Center pillar upper trim |
| (3) Outer seat belt ASSY | (6) Inner seat belt ASSY |

Tightening torque: N·m (kgf·m, ft·lb)

T1: 30 (3.1, 22)

T2: 38 (3.9, 28)

T3: 53 (5.4, 39)

2. REAR SEAT BELT (SEDAN MODEL)

SB-00147

- | | |
|------------------------------------|------------------------------|
| (1) Outer seat belt RH ASSY | (3) Outer seat belt LH ASSY |
| (2) Shoulder seat belt center ASSY | (4) Center seat belt LH ASSY |

Tightening torque: N·m (kgf·m, ft·lb)
T: 30 (3.1, 22)

General Description

SEAT BELT SYSTEM

3. REAR SEAT BELT (WAGON MODEL)

SB-00148

- | | |
|------------------------------------|------------------------------|
| (1) Outer seat belt RH ASSY | (5) Center seat belt LH ASSY |
| (2) Shoulder seat belt center ASSY | (6) Outer belt guide RH |
| (3) Outer seat belt LH ASSY | (7) Outer belt guide LH |
| (4) Center seat belt RH ASSY | |

Tightening torque: N·m (kgf·m, ft·lb)

T1: 30 (3.1, 22)

T2: 53 (5.4, 39.1)

B: CAUTION

- Before starting service, turn the ignition switch to OFF, disconnect the battery ground cable and wait for 20 seconds or more.
- The pretensioner system has a backup power source. The pretensioner might deploy if you do not wait for 20 seconds or more before starting work.
- Do not drop or apply any impact to the pretensioner.
- If oil, grease or water gets on the pretensioner, wipe it off immediately with a dry cloth.
- Do not expose the pretensioner to high temperature or flame.
- Do not allow current to flow through or voltage to reach the pretensioner. Do not use a circuit tester to check resistance of the pretensioner.

- Do not disassemble or attempt to repair the pretensioner. If it is dented, cracked or deformed, replace it with a new one.
- Do not use the airbag or pretensioner parts from other vehicles. Always replace the parts with new ones.
- When handling a seat belt with deployed pretensioner, wear gloves and goggles. Wash your hands afterwards.
- Do not reuse a seat belt with deployed pretensioner.
- If the material gets in your eyes or on your skin during deployment, wash it away with clean water, and then consult a doctor.

C: PREPARATION TOOL

1. GENERAL TOOL

TOOL NAME	REMARKS
TORX® T50	Used for removing and installing inner belt.

2. Pretensioner Connector

A: REMOVAL

1) Using a flat tip screwdriver, pry the push lock upward to unlock.

2) Pull out the connector to disconnect it from retractor assembly.

B: INSTALLATION

Connect the connector in the reverse order of disconnection. At this time, be sure to insert the push lock until a connecting sound is heard.

CAUTION:

- Be sure to insert the connector in until it is locked. Then pull on it gently to make sure that it is locked.
- Be sure to push the push lock in securely.

3. Inspection Locations After a Collision

A: INSPECTION

Check for the following, and replace with new parts if necessary.

- Center pillar lower garnish is discolored or cracked.
- Wire harness and connector are damaged.

Seat Belt Warning System

SEAT BELT SYSTEM

4. Seat Belt Warning System

A: WIRING DIAGRAM

<Ref. to WI-139, WIRING DIAGRAM, Seat Belt Warning System.>

B: INSPECTION

TROUBLE SYMPTOM:

- Driver's side seat belt warning light does not come on or go off.
- Warning buzzer does not beep.

	Step	Check	Yes	No
1	CHECK BODY INTEGRATED UNIT. 1) Connect the Subaru Select Monitor to data link connector. 2) Turn the ignition switch to ON. (engine OFF) 3) Turn the Subaru Select Monitor switch to ON. 4) Read the data of driver's seat belt switch using Subaru Select Monitor. <Ref. to LAN(diag)-14, OPERATION, Subaru Select Monitor.>	Is the seat belt switch display OFF?	Go to step 2.	Go to step 6.
2	CHECK SEAT BELT WARNING LIGHT. Read the data of driver's seat belt warning light using Subaru Select Monitor.	Is the seat belt warning light display ON?	Go to step 3.	Check the harness between combination meter and body integrated unit.
3	CHECK BODY INTEGRATED UNIT. 1) Connect the driver's seat belt. 2) Read the data of driver's seat belt switch using Subaru Select Monitor.	Is the seat belt switch display ON?	Go to step 4.	Go to step 6.
4	CHECK SEAT BELT WARNING LIGHT. Read the data of driver's seat belt warning light using Subaru Select Monitor.	Is the seat belt warning light display OFF? Also, is the seat belt warning light in the combination meter gone off?	Go to step 5.	Check the harness between ignition switch and body integrated unit.
5	CHECK SEAT BELT WARNING BUZZER. 1) Disconnect the driver's seat belt. 2) Turn the ignition switch to ON.	Does the buzzer beep?	Go to step 6.	Replace the body integrated unit.
6	CHECK DRIVER'S SEAT BELT BUCKLE SWITCH. 1) Connect the driver's seat belt. 2) Measure the voltage between connector (R8) and chassis ground. <i>Connector & terminal</i> <i>(R8) No. 1 (+) — Chassis ground (-):</i>	Is the voltage more than 10 V?	Go to step 7.	Repair the harness between driver's seat buckle switch and chassis ground.
7	CHECK DRIVER'S SEAT BELT BUCKLE SWITCH. 1) Disconnect the connector (R8) from driver's seat inner belt. 2) Measure the resistance between connector (R8) terminals and chassis ground. <i>Connector & terminal</i> <i>(R8) No. 1 — Chassis ground:</i> <i>(R8) No. 3 — Chassis ground:</i>	Is the resistance more than 1 MΩ?	Go to step 8.	Replace the driver's seat inner belt. <Ref. to SB-10, Front Seat Belt.>
8	CHECK BODY HARNESS. Measure the voltage between connector (R167) and chassis ground. <i>Connector & terminal</i> <i>(R167) No. 11 (+) — Chassis ground (-):</i>	Is the voltage more than 10 V? Also, does the seat belt warning light illuminate?	Go to step 9.	Repair or replace the driver's seat inner belt and body harness.

Seat Belt Warning System

SEAT BELT SYSTEM

Step	Check	Yes	No
9 CHECK BODY INTEGRATED UNIT. Measure the voltage between connector (i84) and chassis ground. <i>Connector & terminal (i84) No. 4 (+) — Chassis ground (-):</i>	Is the voltage more than 10 V?	Go to step 10.	Check the body integrated unit.
10 CHECK COMBINATION METER. Measure the voltage between connector (R167) and chassis ground. <i>Connector & terminal (R167) No. 20 (+) — Chassis ground (-):</i>	Is the voltage more than 10 V? Also, does the seat belt warning light illuminate?	Go to step 11.	Check the body integrated unit.
11 CHECK COMBINATION METER. Measure the voltage between connector (i10) and chassis ground. <i>Connector & terminal (i10) No. 9 (+) — Chassis ground (-):</i>	Is the voltage more than 10 V? Also, does the seat belt warning light illuminate?	Go to step 12.	Check the combination meter.
12 CHECK SEAT BELT WARNING SYSTEM. 1) Disconnect the driver's seat belt. 2) Turn the ignition switch to ON.	Does the seat belt warning buzzer beep and warning light blink for 6 seconds after turning the ignition switch to ON?	Go to step 13.	Replace the body integrated unit.
13 CHECK SEAT BELT WARNING SYSTEM. Wait for 6 seconds from the step 12 condition (seat belt warning buzzer beeps and warning light blinks).	Does the seat belt warning light repeat illuminating/ blinking every 15-seconds, and the warning buzzer beep?	Go to step 14.	Replace the body integrated unit.
14 CHECK SEAT BELT WARNING SYSTEM. Connect the driver's seat belt buckle in the step 13 condition (seat belt warning light repeat illuminating/ blinking every 15-seconds, and warning buzzer beeps).	Does the seat belt warning light go off and the buzzer stop?	Go to step 15.	Replace the body integrated unit.
15 CHECK SEAT BELT WARNING SYSTEM. Disconnect the driver's seat belt.	Does the seat belt warning light repeat illuminating/ blinking every 15-seconds?	Go to step 16.	Replace the body integrated unit.
16 CHECK SEAT BELT WARNING SYSTEM. 1) Lift-up the vehicle. NOTE: Raise all wheels off floor. 2) Start the engine, and set the vehicle speed to more than 15 km/h (9 MPH). NOTE: The speed difference between front and rear wheels may light the ABS or VDC warning light, but this indicates no malfunction. When diagnosis is finished, perform the ABS or VDC memory clearance procedure. <Ref. to ABS(diag)-15, OPERATION, Subaru Select Monitor.> or <Ref. to VDC(diag)-16, OPERATION, Subaru Select Monitor.>	Does the seat belt warning light repeat illuminating/ blinking every 15-seconds?	Go to step 17.	Replace the body integrated unit.
17 CHECK SEAT BELT WARNING SYSTEM. Connect the driver's seat belt in the step 16 condition.	Does the seat belt warning light go off and the buzzer stop?	Go to step 18.	Replace the body integrated unit.
18 CHECK SEAT BELT WARNING SYSTEM. Disconnect the driver's seat belt in the step 17 condition.	Does the seat belt warning light repeat illuminating/ blinking every 15-seconds?	Go to step 19.	Replace the body integrated unit.
19 CHECK SEAT BELT WARNING SYSTEM. Connect the driver's seat belt.	Does the seat belt warning light go off and the buzzer stop?	A temporary poor contact.	Replace the body integrated unit.

Front Seat Belt

SEAT BELT SYSTEM

5. Front Seat Belt

A: REMOVAL

1. OUTER SEAT BELT ASSEMBLY

- 1) Fold the backrest all the way forward, and then move the front seat all the way forward.
- 2) Turn the ignition switch to OFF, disconnect the battery ground cable from battery, and wait for more than 20 seconds before starting work.
- 3) Remove the seat belt anchor cover of passenger's seat to remove outer seat belt assembly of passenger's side.

- Manual seat

(A) Claw

- Power seat

(A) Claw

- 4) Remove the center pillar lower trim. <Ref. to EI-60, REMOVAL, Lower Inner Trim.>
- 5) Remove the center pillar upper trim. <Ref. to EI-61, REMOVAL, Upper Inner Trim.>

- 6) Remove the bolt, and remove the center pillar inner protector lower.

- 7) Remove the bolt, and then remove the shoulder anchor.

- 8) Remove the bolt, and then remove the adjustable anchor assembly.

- 9) Disconnect the pretensioner connector (A), and remove the bolt, and then remove the seat belt retractor.

- NOTE:**
Disconnect the tension reducer connector (B) for the seat belt retractor with tension reducer function.

CAUTION:

- Do not drop or apply any impact to the pretensioner.
- Since the pretensioner and bracket are integrated as a unit, do not disassemble them.

2. INNER SEAT BELT ASSEMBLY

- 1) Turn the ignition switch to OFF, disconnect the battery ground cable from battery, and wait for more than 20 seconds before starting work.
- 2) Remove the four bolts in the slide rail LH and RH.
- 3) Disconnect the seat belt warning light connector under the seat.
- 4) Remove the harness clips from slide rail.
- 5) Remove the TORX® bolt, and then remove the inner seat belt assembly.

B: INSTALLATION

1. OUTER SEAT BELT ASSEMBLY

Install in the reverse order of removal.

CAUTION:

- The parts of driver and passenger sides are not identical. Before installation, make sure that the correct part is used.
- Be careful not to twist the seat belts during installation.

Tightening torque:

<Ref. to SB-2, FRONT SEAT BELT, COMPONENT, General Description.>

2. INNER SEAT BELT ASSEMBLY

Install in the reverse order of removal.

CAUTION:

- Be sure to perform the system calibration for passenger detection system after passenger's seat installation. <Ref. to OD(diag)-12, SYSTEM CALIBRATION, OPERATION, Subaru Select Monitor.>

Failure to do so may cause improper activation of passenger's airbag.

- After driver's and passenger's inner seat belts installation, check that the seat belt buckle switch operates normally using Subaru Select Monitor on the {Status Data} of «Airbag System». <Ref. to AB(diag)-28, READ STATUS DATA, OPERATION, Subaru Select Monitor.>

Improper buckle switch function may cause airbag system malfunction. Inner seat belt assembly harness (1) must be routed securely as shown in the figure, since it may affect the performances of seat position sensor and occupant detection system.

- Driver's seat

- **Passenger's seat**

Tightening torque:

<Ref. to SB-2, FRONT SEAT BELT, COMPONENT, General Description.>

C: INSPECTION

1. OUTER SEAT BELT ASSEMBLY

Check for the following, and replace with new parts if necessary.

- Pretensioner is cracked or deformed.
- Seat belt is slackened, bent or worn. Seat belt is abnormally wound or extended.

2. INNER SEAT BELT ASSEMBLY

Check for the following, and replace with new parts if necessary.

- Inner seat belt assembly is deformed or damaged.
- Seat belt buckle cannot be engaged properly.

6. Rear Seat Belt

A: REMOVAL

1. OUTER SEAT BELT RH ASSEMBLY AND LH ASSEMBLY (SEDAN MODEL)

- 1) Remove the rear seat. <Ref. to SE-20, REMOVAL, Rear Seat.>
- 2) Remove the seat belt lower anchor bolt.

- 3) Remove the rear quarter trim. <Ref. to EI-62, SEDAN MODEL, REMOVAL, Rear Quarter Trim.>
- 4) Remove the bolt to remove outer seat belt assembly.

2. SHOULDER SEAT BELT CENTER ASSEMBLY (SEDAN MODEL)

- 1) Remove the rear seat cushion. <Ref. to SE-20, REMOVAL, Rear Seat.>
- 2) Remove the seat belt lower anchor bolt.

- 3) Remove the rear quarter trim. <Ref. to EI-62, REMOVAL, Rear Quarter Trim.>
- 4) Remove the rear shelf trim. <Ref. to EI-69, REMOVAL, Rear Shelf Trim.>

- 5) Remove the bolt to remove shoulder seat belt assembly.

3. CENTER SEAT BELT LH ASSEMBLY (SEDAN MODEL)

- 1) Remove the rear seat cushion. <Ref. to SE-20, REMOVAL, Rear Seat.>
- 2) Remove the bolt to remove center seat belt LH assembly.

4. OUTER SEAT BELT RH ASSEMBLY AND LH ASSEMBLY (WAGON MODEL)

- 1) Remove the luggage floor box. <Ref. to EI-73, REMOVAL, Luggage Floor Box.>
- 2) Remove the rear seat cushion and backrest shoulder. <Ref. to SE-20, SEDAN MODEL, REMOVAL, Rear Seat.>
- 3) Remove the rear quarter lower trim. <Ref. to EI-62, WAGON MODEL, REMOVAL, Rear Quarter Trim.>
- 4) Remove the bolt to remove outer seat belt retractor.

Rear Seat Belt

SEAT BELT SYSTEM

5) Remove the bolts to remove outer seat belt guide.

5. SHOULDER SEAT BELT CENTER ASSEMBLY (WAGON MODEL)

- 1) Remove the quarter rear pillar trim. <Ref. to EI-62, WAGON MODEL, REMOVAL, Rear Quarter Trim.>
- 2) Remove the cover (A) from roof trim, and then inset it to the inside of roof trim.

3) Remove the clips, and then lower the roof trim end.

CAUTION:

When removing the roof trim clip, do not pull the roof trim end backward with excessive force, otherwise roof trim may be damaged.

4) Remove the bolt to remove seat belt retractor.

6. CENTER SEAT BELT RH ASSEMBLY AND LH ASSEMBLY (WAGON MODEL)

- 1) Remove the rear seat cushion. <Ref. to SE-20, SEDAN MODEL, REMOVAL, Rear Seat.>
- 2) Remove the bolts, and then detach the center seat belt assembly.

B: INSTALLATION

1. OUTER SEAT BELT RH ASSEMBLY AND LH ASSEMBLY (SEDAN MODEL)

Install in the reverse order of removal.

CAUTION:

- During installation, make sure that the seat belts are not twisted.
- After installation, make sure that the seat belts are smoothly extended and wound.

2. SHOULDER SEAT BELT CENTER ASSEMBLY (SEDAN MODEL)

Install in the reverse order of removal.

CAUTION:

- During installation, make sure that the seat belts are not twisted.
- After installation, make sure that the seat belts are smoothly extended and wound.

3. CENTER SEAT BELT LH ASSEMBLY (SEDAN MODEL)

Install in the reverse order of removal.

CAUTION:

During installation, make sure that the seat belts are not twisted.

4. OUTER SEAT BELT RH ASSEMBLY AND LH ASSEMBLY (WAGON MODEL)

Install in the reverse order of removal.

CAUTION:

- During installation, make sure that the seat belts are not twisted.
- After installation, make sure that the seat belts are smoothly extended and wound.

5. SHOULDER SEAT BELT CENTER ASSEMBLY (WAGON MODEL)

Install in the reverse order of removal.

CAUTION:

- After seat belt guide installation, make sure that the seat belts are wound.

- During installation, make sure that the seat belts are not twisted.
- After installation, make sure that the seat belts are smoothly extended and wound.

6. CENTER SEAT BELT RH ASSEMBLY AND LH ASSEMBLY (WAGON MODEL)

Install in the reverse order of removal.

CAUTION:

During installation, make sure that the seat belts are not twisted.

C: INSPECTION

1. OUTER SEAT BELT RH ASSEMBLY AND LH ASSEMBLY (SEDAN MODEL)

Check for the following, and replace with new parts if necessary.

- Seat belt is slackened, bent or worn. Seat belt is abnormally wound or extended.

2. SHOULDER SEAT BELT CENTER ASSEMBLY (SEDAN MODEL)

Check for the following, and replace with new parts if necessary.

- Seat belt is slackened, bent or worn. Seat belt is abnormally wound or extended.

3. CENTER SEAT BELT LH ASSEMBLY (SEDAN MODEL)

Check for the following, and replace with new parts if necessary.

- Inner belt is deformed or damaged.
- Seat belt buckle cannot be engaged properly.

4. OUTER SEAT BELT RH ASSEMBLY AND LH ASSEMBLY (WAGON MODEL)

Check for the following, and replace with new parts if necessary.

- Seat belt is slackened, bent or worn. Seat belt is abnormally wound or extended.

5. SHOULDER SEAT BELT CENTER ASSEMBLY (WAGON MODEL)

Check for the following, and replace with new parts if necessary.

- Seat belt is slackened, bent or worn. Seat belt is abnormally wound or extended.

6. CENTER SEAT BELT RH ASSEMBLY AND LH ASSEMBLY (WAGON MODEL)

Check for the following, and replace with new parts if necessary.

- Inner belt is deformed or damaged.
- Seat belt buckle cannot be engaged properly.

Rear Seat Belt

SEAT BELT SYSTEM

General Description

LIGHTING SYSTEM

1. General Description

A: SPECIFICATION

Headlight	Halogen type low beam		12 V — 55 W
	Halogen type high beam		12 V — 60 W
Front turn signal, parking, front side marker light			12 V — 27/8 W
Front fog light	OUTBACK		12 V — 51 W
	Except for OUTBACK		12 V — 55 W
Side turn signal light			12 V — 2.7 W (LED)
Rear combination light	Stop/tail light		12 V — 21/5 W
	Turn signal light		12 V — 21 W
	Wagon	Rear side marker light	12 V — 5 W
Back-up light	Sedan		12 V — 16 W
	Wagon		12 V — 16 W
License plate light			12 V — 5 W
High-mounted stop light	Sedan		12 V — 21 W
	Wagon		12 V — 1.3 W (LED)
Room light			12 V — 8 W
Spot map light			12 V — 8 W
Luggage room light			12 V — 13 W
Trunk room light			12 V — 5 W
Glove box light			12 V — 1.4 W
Door step light			12 V — 3.5 W

B: CAUTION

- Before removing or installing parts, always disconnect the battery ground cable from battery. When replacing the audio, control module and other parts provided with memory functions, record the memory contents before disconnecting the battery ground cable. Otherwise, the memory will be erased.
- Reassemble the parts in the reverse order of disassembly procedure unless otherwise indicated.
- Adjust parts to the given specifications.
- Connect the connectors securely during reassembly.

- After reassembly, make sure functional parts operate smoothly.

WARNING:

- **The air bag system wiring harness is routed near electrical parts and switches. Air bag system wiring harnesses and connectors are yellow. Do not use the electrical test equipment on these circuits.**
- **Be careful not to damage the air bag system wiring harness when servicing electrical parts and switches.**

C: PREPARATION TOOL

1. GENERAL TOOL

TOOL NAME	REMARKS
Circuit tester	Used for measuring resistance and voltage.

2. Headlight and Tail Light System

A: WIRING DIAGRAM

1. HALOGEN TYPE HEADLIGHT

<Ref. to WI-141, WIRING DIAGRAM, Headlight System.>

2. CLEARANCE LIGHT AND ILLUMINATION LIGHT

<Ref. to WI-147, WIRING DIAGRAM, Clearance Light and Illumination Light System.>

B: INSPECTION

1. HEADLIGHT SWITCH

<Ref. to LI-9, INSPECTION, Combination Switch (Light).>

2. HEADLIGHT RELAY

Measure the resistance between headlight relay terminals when connecting terminal No. 4 to battery positive terminal and terminal No. 3 to battery ground terminal.

Current	Terminal No.	Standard
Flow	1 and 2	Less than 1 Ω
No flow		More than 1 MΩ

3. TAIL AND ILLUMINATION RELAY

Measure the resistance between tail and illumination relay terminals when connecting terminal No. 4 to battery positive terminal and terminal No. 3 to battery ground terminal.

Current	Terminal No.	Standard
Flow	1 and 2	Less than 1 Ω
No flow		More than 1 MΩ

3. Front Fog Light System

A: WIRING DIAGRAM

1. FRONT FOG LIGHT

<Ref. to WI-144, WIRING DIAGRAM, Front Fog Light System.>

B: INSPECTION

1. FRONT FOG LIGHT SWITCH

Measure the resistance between front fog light switch terminals.

<Ref. to LI-9, INSPECTION, Combination Switch (Light).>

2. FRONT FOG LIGHT RELAY

Measure the resistance between front fog light relay terminals when connecting terminal No. 4 to battery positive terminal and terminal No. 3 to battery ground terminal.

Current	Terminal No.	Standard
Flow	1 and 2	Less than 1 Ω
No flow		More than 1 M Ω

4. Turn Signal Light and Hazard Light System

A: WIRING DIAGRAM

1. TURN SIGNAL LIGHT AND HAZARD LIGHT SYSTEM

<Ref. to WI-151, WIRING DIAGRAM, Turn Signal Light and Hazard Light System.>

B: INSPECTION

1. TURN SIGNAL SWITCH

<Ref. to LI-9, INSPECTION, Combination Switch (Light).>

2. HAZARD SWITCH

Measure the resistance between hazard switch terminals.

Switch position	Terminal No.	Standard
OFF	2 and 3	More than 1 MΩ
ON		Less than 1 Ω

3. TURN SIGNAL LIGHT AND HAZARD LIGHT MODULE

Connect the battery and turn signal light bulb to the module. The module is properly functioning if it blinks when power is supplied to the circuit.

Back-up Light System

LIGHTING SYSTEM

5. Back-up Light System

A: WIRING DIAGRAM

1. BACK-UP LIGHT

<Ref. to WI-145, WIRING DIAGRAM, Back-up Light System.>

B: INSPECTION

1. BACK-UP LIGHT SWITCH (MT MODEL)

Measure the resistance between back-up light switch terminals.

Switch position	Terminal No.	Standard
When shift lever is set in reverse position	1 and 2	Less than 1 Ω
Other positions		More than 1 M Ω

2. INHIBITOR SWITCH (4AT MODEL)

Measure the resistance between inhibitor switch terminals.

Switch position	Terminal No.	Standard
When the selector lever is in "R" range	1 and 2	Less than 1 Ω
Other positions		More than 1 M Ω

3. BACK-UP LIGHT RELAY (5AT MODEL)

Measure the resistance between back-up light relay terminals when connecting terminal No. 4 to battery positive terminal and terminal No. 3 to battery ground terminal.

Current	Terminal No.	Standard
Flow	1 and 2	Less than 1 Ω
No flow		More than 1 M Ω

NOTE:

Check other than back-up light relay. <Ref. to 4AT-48, INSPECTION, Inhibitor Switch.>

6. Stop Light System

A: WIRING DIAGRAM

1. STOP LIGHT

<Ref. to WI-146, WIRING DIAGRAM, Stop Light System.>

B: INSPECTION

1. STOP LIGHT SWITCH

Measure the resistance between stop light switch terminals.

(1) Model without cruise control

(2) Model with cruise control

Switch position	Terminal No.	Standard
When brake pedal is depressed	Model without cruise control: 1 and 2	Less than 1 Ω
When brake pedal is released	Model with cruise control: 2 and 3	More than 1 MΩ

Room Light System

LIGHTING SYSTEM

7. Room Light System

A: WIRING DIAGRAM

1. ROOM LIGHT

<Ref. to WI-153, WIRING DIAGRAM, Interior Light System.>

B: INSPECTION

1. DOOR SWITCH

Measure the resistance between door switch terminals.

Switch position	Terminal No.	Standard
When door is opened	1 and 3	Less than 1 Ω
When door is closed		More than 1 MΩ

2. REAR GATE LATCH SWITCH

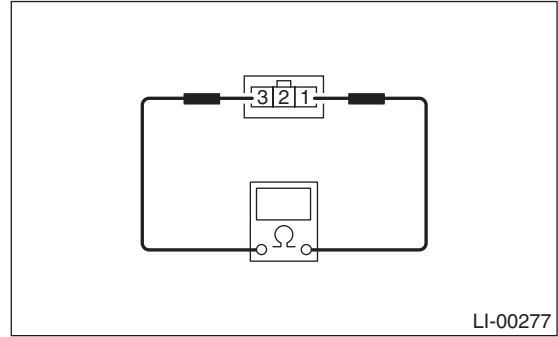

Measure the resistance between rear gate latch switch terminals.

Switch position	Terminal No.	Standard
When rear gate is opened	1 and 2	Less than 1 Ω
When rear gate is closed		More than 1 MΩ

3. TRUNK ROOM LIGHT SWITCH

Measure the resistance between trunk room light switch terminals.

Switch position	Terminal No.	Standard
When trunk lid is opened	1 and 3	Less than 1 Ω
When trunk lid is closed		More than 1 MΩ

8. Combination Switch (Light)

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Remove the screws and remove the steering column cover (upper and lower).

- 3) Disconnect the connector from combination switch.
- 4) Remove the screws which secure switch, then remove the combination switch.

B: INSTALLATION

Install in the reverse order of removal.

C: INSPECTION

Measure the resistance between combination switch terminals.

1. LIGHTING SWITCH

Switch position	Terminal No.	Standard
OFF	—	More than 1 MΩ
Tail	14 and 16	Less than 1 Ω
Head	13, 14 and 16	Less than 1 Ω

2. DIMMER & PASSING SWITCH

Switch position	Terminal No.	Standard
Passing	7, 8 and 16	Less than 1 Ω
Low beam	17 and 16	Less than 1 Ω
High beam	7 and 16	Less than 1 Ω

3. TURN SIGNAL SWITCH

Switch position	Terminal No.	Standard
Left	1 and 2	Less than 1 Ω
Neutral	—	More than 1 MΩ
Right	2 and 3	Less than 1 Ω

4. FRONT FOG LIGHT

Switch position	Terminal No.	Standard
OFF	—	More than 1 MΩ
ON	10 and 11	Less than 1 Ω

Combination Base Switch Assembly

LIGHTING SYSTEM

9. Combination Base Switch Assembly

A: REMOVAL

- 1) Remove the driver's airbag module. <Ref. to AB-16, REMOVAL, Driver's Airbag Module.>
- 2) Remove the steering wheel. <Ref. to PS-14, REMOVAL, Steering Wheel.>
- 3) Remove the screws and remove the steering column lower cover.

- 4) Remove the combination switch. <Ref. to LI-9, REMOVAL, Combination Switch (Light).> <Ref. to WW-6, REMOVAL, Combination Switch (Wiper).>
- 5) Remove the four screws and remove the roll connector.
- 6) Remove the three screws.

- 7) Disconnect the connector and remove the combination base switch assembly.

B: INSTALLATION

- 1) Install in the reverse order of removal.
- 2) Before installing steering wheel, be sure the direction of roll connector is adjusted with steering. <Ref. to AB-25, ADJUSTMENT, Roll Connector.>

C: INSPECTION

1. COMBINATION BASE SWITCH ASSEMBLY

Inspect the combination base switch assembly and roll connector for crack or deformation. If any damage is found, replace with a new one.

2. PARKING SWITCH

Measure the resistance between parking switch terminals.

Switch position	Terminal No.	Standard
OFF	2 and 4	Less than 1 Ω
ON	1 and 4	Less than 1 Ω

10. Headlight Assembly

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Remove the air intake duct. (When removing the headlight RH)

- 3) Remove the front grille. <Ref. to EI-24, REMOVAL, Front Grille.>
- 4) Remove the front bumper. <Ref. to EI-30, REMOVAL, Front Bumper.>
- 5) Disconnect each harness connector.
- 6) Remove the 5 bolts, disengage the clip, and then detach the headlight assembly.

B: INSTALLATION

Install in the reverse order of removal.

C: ADJUSTMENT

1. HEADLIGHT AIMING

NOTE:

Aiming of this headlight can be adjusted only in the vertical direction. It cannot be adjusted in the horizontal direction.

CAUTION:

Turn off the light before adjusting headlight beam level. If the light is necessary to check aiming, do not turn on for more than two minutes.

NOTE:

Before checking the headlight beam level, be sure of the following:

- The area around the headlight has not sustained any accident, damage or other type of deformation.
- Vehicle is parked on a level surface.
- The inflation pressure of tires is correct.
- Vehicle's fuel tank is fully filled.

1) Bounce the vehicle several times to normalize the suspension.

2) Make certain that someone is seated in the driver's seat.

3) Turn the headlights on and then adjust the low beam pattern.

Headlight Assembly

LIGHTING SYSTEM

NOTE:

Adjust the headlight aiming by turning the adjusting screw (A).

(A) Bulb center marking

(B) 3 m (10 ft)

H mm (in)				h mm (in) at 3 m (10 ft)
Sedan		Wagon		
Except for OUTBACK	OUTBACK	Except for OUTBACK	OUTBACK	21 (0.83)
640 (25.20)	707 (27.83)	637 (25.08)	707 (27.83)	

11. Headlight Bulb

A: REMOVAL

1. HIGH BEAM AND LOW BEAM

CAUTION:

- Because the halogen bulb operates at a high temperature, dirt and oil on the bulb surface reduces the bulb's service life. Hold the flange portion when replacing the bulb. Never touch the glass portion.
- Do not leave the headlight without a bulb for a long time. Dust, moisture, etc. entering the headlight may affect its performance.

- 1) Disconnect the ground cable from battery.
- 2) Remove the air intake duct. (When removing the headlight bulb RH).

- 3) Remove the battery cover. (When removing the headlight bulb LH).
- 4) Tilt the washer tank filler neck. (When removing the headlight bulb LH).
- 5) Disconnect the harness connector.
- 6) Remove the bulb assembly (A) to remove high beam. To remove the low beam, remove the back cover (B), and then go to Step 7.

- 7) Remove the light bulb retaining spring (A) to remove bulb.

B: INSTALLATION

Install in the reverse order of removal.

C: INSPECTION

- 1) Visually check the bulb for blow out.
- 2) Check the bulb specification.
<Ref. to LI-2, SPECIFICATION, General Description.>
- 3) If NG, replace the bulb with a new one.

12. Front Turn Signal Light Bulb

A: REMOVAL

1) When removing the turn signal light bulb, fully turn the steering wheels to opposite direction from desired turn signal light bulb.

- (1) Turn the steering wheel fully.
- (2) Mud guard
- (3) Front turn signal light

2) Turn the mud guard inward.

3) Turn the socket (A) from wheel arch part, and then remove the front turn signal light bulb.

CAUTION:

For 5AT model, remove the turn signal light bulb LH from engine compartment with removing battery, because it can not be removed from wheel arch part.

B: INSTALLATION

Install in the reverse order of removal.

C: INSPECTION

- 1) Visually check the bulb for blow out.
- 2) Check the bulb specification.
<Ref. to LI-2, SPECIFICATION, General Description.>
- 3) If NG, replace the bulb with a new one.

13. Parking Light Bulb

A: SPECIFICATION

The parking light bulb is integrated into front turn signal light bulb as a unit; therefore, refer to "Front Turn Signal Light Bulb" for removal procedure.
<Ref. to LI-14, REMOVAL, Front Turn Signal Light Bulb.>

14. Front Side Marker Light Bulb

A: SPECIFICATION

The front marker light bulb is integrated into front turn signal light bulb as a unit; therefore, refer to "Front Turn Signal Light Bulb" for removal procedure. <Ref. to LI-14, REMOVAL, Front Turn Signal Light Bulb.>

15. Front Fog Light Assembly

A: REMOVAL

1. EXCEPT FOR OUTBACK MODEL

- 1) Disconnect the ground cable from battery.
- 2) Remove the front fog light cover (A).

- 3) Disengage the two clips, and then turn over the lower mud guard.

- 4) Disconnect the harness connector.
- 5) Remove the mounting bolts, and then detach the fog light assembly by pulling it.

2. OUTBACK MODEL

- 1) Disconnect the ground cable from battery.

- 2) Remove the two clips, and then turn over the lower mud guard.

- 3) Disconnect the harness connector.
- 4) Remove the mounting nuts and clips, and then detach the fog light assembly by pulling it.

B: INSTALLATION

Install in the reverse order of removal.

16. Front Fog Light Bulb

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Disengage the two clips, and then turn over the lower mud guard.

- 3) Disconnect the harness connector.
- 4) Remove the back cover.

- 5) Remove the spring retainer then detach the fog light bulb.

B: INSTALLATION

Install in the reverse order of removal.

C: INSPECTION

- 1) Visually check the bulb for blow out.
- 2) Check the bulb specification. <Ref. to LI-2, SPECIFICATION, General Description.>
- 3) If NG, replace the bulb with a new one.

17.Side Turn Signal Light Assembly

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Remove the scalp caps. <Ref. to GW-18, REPLACEMENT, Scalp Cap.>
- 3) Remove the mirror. <Ref. to GW-21, REPLACEMENT, Outer Mirror.>
- 4) Disconnect the harness connector, remove the 3 mounting screws and then remove the side turn signal light assembly.

B: INSTALLATION

Install in the reverse order of removal.

C: INSPECTION

- 1) Install the side turn signal light assembly and check that it blinks normally.
- 2) If it does not blink normally, replace the side turn signal light assembly with a new one.

NOTE:

Since LED (Light Emitting Diode) is used for side turn signal light, replace the side turn signal light assembly when the LED is powered off.

18. Rear Combination Light Assembly

A: REMOVAL

1. SEDAN MODEL

- 1) Disconnect the ground cable from battery.
- 2) Remove the trunk room side trim. <Ref. to EI-70, REMOVAL, Trunk Room Trim.>
- 3) Remove the four nuts, and then detach the rear combination light after disconnecting the connector.

2. WAGON MODEL

- 1) Disconnect the ground cable from battery.
- 2) Remove the clips.

- 3) While pressing the portion (A), insert your finger or flat-tip screwdriver wrapped with tape into the clearance (B) to remove pawls in the order of (C), (D), (E), and remove the rear combination cover.

- 4) Remove the two bolts, and then detach the rear combination light by pulling it to the rear side of vehicle.

- 5) Remove the rear combination light after turning the socket of tail/stop light bulb and rear turn signal light bulb to remove the bulbs.

B: INSTALLATION

Install in the reverse order of removal.

19. Tail/Stop Light Bulb

A: REMOVAL

1. SEDAN MODEL

- 1) Remove the trunk side trim cover.
- 2) Turn the socket and remove the bulb.

2. WAGON MODEL

- 1) Remove the rear combination light assembly.
<Ref. to LI-20, WAGON MODEL, REMOVAL, Rear Combination Light Assembly.>
- 2) Turn the socket and remove the bulb.

B: INSTALLATION

Install in the reverse order of removal.

C: INSPECTION

- 1) Visually check the bulb for blow out.
- 2) Check the bulb specification. <Ref. to LI-2, SPECIFICATION, General Description.>
- 3) If NG, replace the bulb with a new one.

20.Rear Turn Signal Light Bulb

A: REMOVAL

1. SEDAN MODEL

- 1) Remove the trunk side trim cover.
- 2) Turn the socket and remove the bulb.

2. WAGON MODEL

- 1) Remove the rear combination light assembly.
<Ref. to LI-20, WAGON MODEL, REMOVAL, Rear Combination Light Assembly.>
- 2) Turn the socket and remove the bulb.

B: INSTALLATION

Install in the reverse order of removal.

C: INSPECTION

- 1) Visually check the bulb for blow out.
- 2) Check the bulb specification. <Ref. to LI-2, SPECIFICATION, General Description.>
- 3) If NG, replace the bulb with a new one.

21.Rear Side Marker Light Bulb

A: REMOVAL

1. SEDAN MODEL

Bulb is not equipped for sedan model, since it is reflex reflector type.

2. WAGON MODEL

- 1) Remove the rear combination light assembly. <Ref. to LI-20, WAGON MODEL, REMOVAL, Rear Combination Light Assembly.>
- 2) Turn the socket and remove the bulb.

B: INSTALLATION

Install in the reverse order of removal.

C: INSPECTION

- 1) Visually check the bulb for blow out.
- 2) Check the bulb specification. <Ref. to LI-2, SPECIFICATION, General Description.>
- 3) If NG, replace the bulb with a new one.

22. Back-up Light Assembly

A: REMOVAL

1. SEDAN MODEL

Remove the rear combination light. <Ref. to LI-20, REMOVAL, Rear Combination Light Assembly.>

2. WAGON MODEL

1) Remove the rear gate trim. <Ref. to EI-68, REMOVAL, Rear Gate Trim.>

2) Disconnect the harness connectors and remove the rear gate garnish. <Ref. to EI-75, REMOVAL, Rear Gate Garnish.>

3) Remove the mounting nuts and detach the back-up light assembly.

B: INSTALLATION

Install in the reverse order of removal.

23.Back-up Light Bulb

A: REMOVAL

1. SEDAN MODEL

- 1) Remove the trunk side trim cover.
- 2) Turn the socket and remove the bulb.

2. WAGON MODEL

- 1) Remove the bulb inspection cover of rear gate trim.
- 2) Turn the socket and remove the bulb.

B: INSTALLATION

Install in the reverse order of removal.

C: INSPECTION

- 1) Visually check the bulb for blow out.
- 2) Check the bulb specification. <Ref. to LI-2, SPECIFICATION, General Description.>
- 3) If NG, replace the bulb with a new one.

24. License Plate Light Assembly

A: REMOVAL

1. SEDAN MODEL

- 1) Remove the trunk lid garnish. <Ref. to EI-74, REMOVAL, Trunk Lid Garnish.>
- 2) Remove the trunk lid trim. <Ref. to EI-70, TRUNK LID TRIM, REMOVAL, Trunk Room Trim.>
- 3) Turn and remove the bulb socket (A). Disengage the clip (B) and remove the license plate light assembly.

B: INSTALLATION

Install in the reverse order of removal.

25. License Plate Light

A: REMOVAL

1. SEDAN MODEL

- 1) Remove the trunk lid trim. <Ref. to EI-70, TRUNK LID TRIM, REMOVAL, Trunk Room Trim.>
- 2) Turn and remove the bulb socket (A).

- 3) Remove the bulb.

2. WAGON MODEL

- 1) Remove the license plate light mounting screw (A) and then remove the lens (B).

- 2) Remove the bulb.

B: INSTALLATION

Install in the reverse order of removal.

C: INSPECTION

- 1) Visually check the bulb for blow out.
- 2) Check the bulb specification. <Ref. to LI-2, SPECIFICATION, General Description.>
- 3) If NG, replace the bulb with a new one.

High-mounted Stop Light

26.High-mounted Stop Light

A: REMOVAL

1. SEDAN MODEL

- 1) Disconnect the ground cable from battery.
- 2) Push the high-mounted stop light backward of the vehicle (1), raise the rear portion of it (2) and remove the clips to remove it.

- 3) Remove the harness from clamp.

- (1) Harness
- (2) Clamp

- 4) Disengage two claws (A), pull out the high-mounted stop light from the cover and remove the claw (B).

- 5) Disengage three claws and remove the lens (A).

- 6) Remove the bulb.

2. WAGON MODEL

- 1) Disconnect the ground cable from battery.
- 2) Detach the roof spoiler. <Ref. to EI-40, REMOVAL, Roof Spoiler.>
- 3) Remove the nuts (A), then detach the high-mounted stop light.

B: INSTALLATION

Install in the reverse order of removal.

C: INSPECTION

1. SEDAN MODEL

- 1) Visually check the bulb for blow out.
- 2) Check the bulb specification. <Ref. to LI-2, SPECIFICATION, General Description.>
- 3) If NG, replace the bulb with a new one.

2. WAGON MODEL

- 1) Install the high-mounted stop light to test if it illuminates normally.
- 2) If the high-mounted stop light does not illuminate, replace it with a new one.

NOTE:

Since LED (Light Emitting Diode) is used for the high-mounted stop light of wagon model, replace the high-mounted stop light assembly when the LED is powered off.

27. Spot Map Light

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Remove the lens (A) and spot map light mounting screws (B).

- Model with sunroof

- Model without sunroof

- 3) Disconnect the harness connectors and remove the spot map light.

B: INSTALLATION

Install in the reverse order of removal.

C: INSPECTION

1. SPOT MAP LIGHT BULB

- 1) Visually check the bulb for blow out.
- 2) Check the bulb specification. <Ref. to LI-2, SPECIFICATION, General Description.>
- 3) If NG, replace the bulb with a new one.

2. SPOT MAP LIGHT SWITCH

Measure the resistance between spot map light switch terminals.

Switch position	Terminal No.	Standard
OFF	—	More than 1 MΩ
ON	1 and 2	18±5.4 Ω

28. Room Light

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Remove the lens (A) and mounting screws (B).

- 3) Disconnect the harness connector and remove the room light.

B: INSTALLATION

Install in the reverse order of removal.

C: INSPECTION

1. ROOM LIGHT BULB

- 1) Visually check the bulb for blow out.
- 2) Check the bulb specification. <Ref. to LI-2, SPECIFICATION, General Description.>
- 3) If NG, replace the bulb with a new one.

2. ROOM LIGHT SWITCH

Measure the resistance between room light switch terminals.

Switch position	Terminal No.	Standard
OFF	—	More than 1 MΩ
ON	1 and 3	1.5±0.5 Ω
DOOR	2 and 3	1.5±0.5 Ω

29. Luggage Room Light

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Remove luggage room light body (A).

- 3) Disconnect the harness connector and remove the lens.

B: INSTALLATION

Install in the reverse order of removal.

C: INSPECTION

1. LUGGAGE ROOM LIGHT BULB

- 1) Visually check the bulb for blow out.
- 2) Check the bulb specification. <Ref. to LI-2, SPECIFICATION, General Description.>
- 3) If NG, replace the bulb with a new one.

2. LUGGAGE ROOM LIGHT SWITCH

Measure the resistance between luggage room light switch terminals.

Switch position	Terminal No.	Standard
OFF	—	More than 1 MΩ
ON	1 and 2	1.5±0.5 Ω
DOOR	2 and 3	1.5±0.5 Ω

Trunk Room Light

LIGHTING SYSTEM

30. Trunk Room Light

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Turn the trunk room light counterclockwise to 60° to remove it and disconnect the harness connector.

- 3) Remove the bulb (A).

B: INSTALLATION

Install in the reverse order of removal.

C: INSPECTION

1. TRUNK ROOM LIGHT BULB

- 1) Visually check the bulb for blow out.
- 2) Check the bulb specification. <Ref. to LI-2, SPECIFICATION, General Description.>
- 3) If NG, replace the bulb with a new one.

2. TRUNK LID SWITCH (TRUNK ROOM LIGHT SWITCH)

Measure the resistance between trunk lid switch terminals.

Trunk lid position	Terminal No.	Standard
Close	1 and 3	More than 1 MΩ
Open		1.5±0.5 Ω

31. Glove Box Light

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Remove the glove box. <Ref. to EI-51, REMOVAL, Glove Box.>
- 3) Disconnect the harness connector.
- 4) Remove the glove box light.

B: INSTALLATION

Install in the reverse order of removal.

C: INSPECTION

- 1) Visually check the bulb for blow out.
- 2) Check the bulb specification.
<Ref. to LI-2, SPECIFICATION, General Description.>
- 3) If NG, replace the bulb with a new one.

32. Door Step Light

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Remove the lens (A), and then remove the door step light bulb.

- 3) Remove the front door trim. <Ref. to EI-48, REMOVAL, Door Trim.>
- 4) Disconnect the harness connector.
- 5) Remove the mounting screw from rear side of trim and remove the door step light.

B: INSTALLATION

Install in the reverse order of removal.

C: INSPECTION

- 1) Visually check the bulb for blow out.
- 2) Check the bulb specification.
<Ref. to LI-2, SPECIFICATION, General Description.>
- 3) If NG, replace the bulb with a new one.

33. Ignition Switch Illumination

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Remove the screws and detach the upper column cover and lower column cover.

- 3) Disconnect the ignition switch illumination connector (A).

C: INSPECTION

- 4) Turn the ignition switch illumination connector to left and disconnect it.

- (A) Ignition switch illumination connector
- (B) Ignition switch illumination
- (C) Immobilizer antenna connector

B: INSTALLATION

Install in the reverse order of removal.

Step	Check	Yes	No
1 CHECK IGNITION SWITCH ILLUMINATION. Make sure the ignition switch illumination illuminates when driver's side door is open.	Does the ignition switch illumination illuminate?	Ignition switch illumination is normal.	Go to step 2.
2 CHECK IGNITION SWITCH ILLUMINATION. Make sure the ignition switch illumination blinks when ignition switch is turned to ON.	Does the ignition switch illumination blink?	Check the function setting of body integrated unit. <Ref. to LAN(diag)-2, Basic Diagnostic Procedure.>	Check the ignition switch illumination circuit. <Ref. to SL-21, CHECK IGNITION SWITCH ILLUMINATION, INSPECTION, Keyless Entry System.>

General Description

WIPER AND WASHER SYSTEMS

1. General Description

A: SPECIFICATION

Front wiper motor	Input	12 V — 72 W or less
Rear wiper motor	Input	12 V — 42 W or less
Front washer motor	Pump type	Centrifugal
	Input	12 V — 36 W or less
Rear washer motor	Pump type	Centrifugal
	Input	12 V — 36 W or less

B: COMPONENT

1. FRONT WIPER

- (1) Wiper rubber
- (2) Wiper blade ASSY
- (3) Wiper arm

- (4) Wiper link ASSY
- (5) Wiper motor ASSY

Tightening torque: N·m (kgf-m, ft-lb)

T1: 6.0 (0.61, 4.4)

T2: 20 (2.0, 14.5)

2. REAR WIPER (WAGON MODEL)

WW-00167

- | | |
|----------------------|----------------------|
| (1) Wiper rubber | (4) Wiper arm cover |
| (2) Wiper blade ASSY | (5) Cap |
| (3) Wiper arm | (6) Wiper motor ASSY |

Tightening torque: N-m (kgf-m, ft-lb)

T1: 7.5 (0.77, 6.0)

T2: 8.0 (0.82, 5.9)

General Description

WIPER AND WASHER SYSTEMS

3. WASHER TANK

WW-00289

- | | |
|---------------------|------------------------|
| (1) Washer nozzle | (5) Front washer motor |
| (2) Washer hose | (6) Rear washer motor |
| (3) Washer tank | (7) Grommet |
| (4) Washer tank cap | (8) Washer motor cover |

Tightening torque: N·m (kgf·m, ft·lb)
T: 6.0 (0.61, 4.4)

C: CAUTION

- Connect the connectors and hoses securely during reassembly.
- After reassembly, make sure functional parts operate smoothly.
- Be careful that wiring harnesses of airbag system pass near electrical parts and switches.
- Wiring harnesses and connectors of all airbag system are yellow color. Do not use a tester equipment on these circuits.
- Care must be taken when connecting the piping hose so that no bending, jamming, etc. are caused.
- Even if a little oil or grease such as silicon oil gets in the tank and washer passages, an oil film is easily formed on the glass, causing the wiper to chatter and judder, therefore, be careful not to let this happen.

2. Wiper and Washer System

A: WIRING DIAGRAM

1. WIPER AND WASHER (FRONT)

<Ref. to WI-157, WIRING DIAGRAM, Front Wiper and Washer System.>

2. WIPER AND WASHER (REAR)

<Ref. to WI-158, WIRING DIAGRAM, Rear Wiper and Washer System.>

B: INSPECTION

Symptom	Repair order
Wiper and washers do not operate.	(1) Wiper fuse (Front: F/B No. 30, Rear: F/B No. 23) (2) Combination switch (3) Wiper motor assembly (4) Wiring harness (5) Body integrated unit (rear wiper only)
Wipers do not operate in LO or HI.	(1) Combination switch (2) Wiper motor assembly (3) Wiring harness
Wipers do not operate in INT.	(1) Combination switch (2) Wiper motor assembly (3) Wiring harness (4) Body integrated unit (rear wiper only)
Washer motor does not operate.	(1) Washer switch (2) Washer motor (3) Wiring harness
Wipers do not operate when washer switch is ON.	(1) Wiper motor assembly (2) Wiring harness
Washer fluid spray does not operate properly.	(1) Washer motor (2) Washer hose and nozzle

Combination Switch (Wiper)

WIPER AND WASHER SYSTEMS

3. Combination Switch (Wiper)

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Remove the driver's airbag module. <Ref. to AB-16, REMOVAL, Driver's Airbag Module.>
- 3) Remove the steering wheel. <Ref. to PS-14, REMOVAL, Steering Wheel.>
- 4) Remove the screw to remove steering column cover (upper and lower).

- 5) Disconnect the connector from combination switch.
- 6) Remove the three screws, and pull out the combination base switch assembly toward you.

- 7) Remove the switch securing screw to remove combination switch.

B: INSTALLATION

Install in the reverse order of removal.

C: INSPECTION

1. COMBINATION SWITCH

- 1) Inspect the continuity between each connector terminal.

	Switch position	Terminal No.	Standard
Front	OFF	7 and 16	Less than 1 Ω
	INT	7 and 16	Less than 1 Ω
	LO	7 and 17	Less than 1 Ω
	HI	8 and 17	Less than 1 Ω
	Washer ON	2 and 11	Less than 1 Ω
Rear	Washer ON	2 and 12	Less than 1 Ω
	OFF	—	More than 1 MΩ
	INT	2 and 13	Less than 1 Ω
	ON	2 and 10	Less than 1 Ω
	Washer ON	2 and 12 12 and 10 2 and 10	Less than 1 Ω

- 2) If continuity is not as specified, replace the switch.

2. FRONT WIPER

1) Check with Subaru Select Monitor

Step	Check	Yes	No
1 CHECK INPUT SIGNAL TO BODY INTEGRATED UNIT. When the front wiper switch is operated, check the input signal using Subaru Select Monitor. 1) Connect the Subaru Select Monitor to data link connector. 2) Turn the ignition switch to ON. 3) Select {Body Integrated Unit} from the main menu. 4) Select {Current Data Display & Save}. 5) When the front wiper switch is set to LO or HI, check the input signal.	Is the input signal normal?	End.	Replace the body integrated unit. <Ref. to SL-54, Body Integrated Unit.>

2) Intermittent operation inspection

- (1) Turn the wiper switch to INT.
- (2) Adjust the intermittent control switch to MAX.
- (3) Apply the battery voltage to switch terminal No. 16 and 2.
- (4) Measure the voltage between combination switch terminals.

Terminals

No. 7 — No. 2:

- (A) Switch position
- (B) Voltage
- (C) MIN.
- (D) MAX.

- (E) Non-intermittent type
- (F) 12 V
- (G) 0 V

- (H) Approx. 2 sec.
- (I) 16±6 sec.
- (J) 3±1 sec.

3) If operation is not as specified, replace the switch.

Combination Switch (Wiper)

WIPER AND WASHER SYSTEMS

3. REAR WIPER

1) Check with Subaru Select Monitor

Step	Check	Yes	No
1 CHECK INPUT OF REAR WIPER. Check the input from body integrated unit using Subaru Select Monitor. 1) Connect the Subaru Select Monitor to data link connector. 2) Turn the ignition switch to ON. 3) Select {Body Integrated Unit} from the main menu. 4) Select {Current Data Display & Save}. 5) Check the input of rear wiper switch.	Is the input normal?	Go to step 2.	Check the rear wiper switch. <Ref. to WW-6, INSPECTION, Combination Switch (Wiper).>
2 CHECK OUTPUT OF BODY INTEGRATED UNIT. When the rear wiper switch is operated, check the output using Subaru Select Monitor. 1) Turn the ignition switch to ON. 2) Operate the rear wiper switch to set to each position of ON and INT. 3) At this time, check the output of body integrated unit.	When it is set to ON, is ON output continuously? When it is set to INT, is ON/OFF output repeatedly? (INT OFF time (when vehicle parked): 12 seconds)	Check the rear wiper motor. <Ref. to WW-18, INSPECTION, Rear Wiper Motor.>	Replace the body integrated unit. <Ref. to SL-54, Body Integrated Unit.>

2) Rear wiper motor circuit check

Step	Check	Yes	No
1 CHECK POWER SUPPLY CIRCUIT OF REAR WIPER MOTOR. 1) Disconnect the harness connector of rear wiper motor. 2) Turn the ignition switch to ACC. 3) Measure the voltage between the rear wiper motor harness connector terminal and chassis ground. Connector & terminal (D43) No. 1 (+) — Chassis ground (-):	Is the voltage more than 10 V?	Go to step 2.	<ul style="list-style-type: none"> • Check the fuse (No. 23 in fuse & relay box). • Check the fusible link (No. 6 in main fuse box).
2 CHECK GROUND CIRCUIT OF REAR WIPER MOTOR. 1) Turn the ignition switch to OFF. 2) Measure the resistance between the rear wiper motor harness connector terminal and chassis ground. Connector & terminal (D43) No. 3 — Chassis ground:	Is the resistance less than 10 Ω ?	Go to step 3.	Repair the open circuit of rear wiper motor ground cable.
3 CHECK HARNESS BETWEEN BODY INTEGRATED UNIT AND REAR WIPER MOTOR. 1) Turn the ignition switch to OFF. 2) Disconnect the harness connector of body integrated unit. 3) Disconnect the harness connector of rear wiper motor. 4) Measure the resistance between the harness connector terminals of body integrated unit and rear wiper motor. Connector & terminal (B280) No. 1 — (D43) No. 2: (B280) No. 8 — (D43) No. 4:	Is the resistance less than 10 Ω ?	Go to step 4.	Repair the open circuit of harness between body integrated unit and rear wiper motor.

Combination Switch (Wiper)

Step	Check	Yes	No
4 CHECK OPERATION OF REAR WIPER MOTOR. 1) Remove the rear wiper motor. 2) Check the rear wiper motor. <Ref. to WW-18, INSPECTION, Rear Wiper Motor.>	Does the rear wiper motor rotate normally?	End.	Replace the rear wiper motor.

NOTE:

Rear wiper intermittent time (AT model only)

Select lever position (AT model only)	Vehicle speed (km/h (MPH))	Intermittent stopping time (sec.)
Rev	—	Continuous operation
Except reverse mode	80 — (50 —)	3
	50 — 80 (31 — 50)	6
	20 — 50 (12 — 31)	9
	0 — 20 (0 — 12)	12

4. Wiper Blade

A: REMOVAL

CAUTION:

When replacing wiper blades or etc., be sure to stand up the driver side wiper arm first, then passenger side wiper arm next. Also, when putting the wiper arms back, be sure to start with passenger side first, then driver side next. Doing this in the reverse order may result in damage of passenger side wiper arm by hitting with driver side wiper blade.

1. FRONT

While pushing the locking clip (A) up, pull out the blade from arm to the arrow direction.

2. REAR

Turn the blade in the direction of arrow (A) and remove it from arm.

- (A) Turn the wiper blade.
- (1) Wiper arm
- (2) Wiper blade
- (3) Installing part of wiper blade

B: INSTALLATION

- 1) Install in the reverse order of removal.
- 2) Confirm that the clip is locked securely.

C: DISASSEMBLY

1. METAL TYPE

Pull side (A) of the wiper rubber stopper and remove the rubber from blade assembly.

2. RESIN TYPE

Pull the wiper rubber top slightly from the stopper (A) and pull out fully.

D: ASSEMBLY

1. METAL TYPE

1) Insert the wiper rubber onto blade so that the stopper is in the position shown in the figure.

2) Make sure the wiper rubber is securely fastened to the pull stopper (A).

2. RESIN TYPE

1) Insert the wiper rubber through the claw B.

2) Insert the wiper rubber until its top end protrudes approx. 20 mm (0.79 in) from stopper D.

3) Insert the wiper rubber into the claw A.

E: INSPECTION

1) When the wiper does not perform well, inspect the followings:

- Make sure the movable part of the wiper blade assembly moves smoothly.
- Make sure the wiper rubber is not deformed or damaged.

2) If damaged, replace with new one.

5. Washer Tank and Motor

A: REMOVAL

- 1) Open the hood.
- 2) Disconnect the ground cable from battery.
- 3) Remove the front bumper. <Ref. to EI-30, REMOVAL, Front Bumper.>
- 4) Remove the clip holding washer water supply tap.

- 5) Remove the two bolts and one nut, hose, connector and washer motor cover, and then remove the washer tank.

B: INSTALLATION

Install in the reverse order of removal.

Tightening torque:

6.0 N·m (0.61 kgf·m, 4.4 ft·lb)

C: DISASSEMBLY

Pull out the washer motor from tank.

D: ASSEMBLY

- 1) Assemble in the reverse order of disassembly.
- 2) Confirm that water does not leak from installation area of motor.

E: INSPECTION

Apply battery voltage to the connector terminal of the washer motor and make sure the motor operates.

Front Wiper Arm

WIPER AND WASHER SYSTEMS

6. Front Wiper Arm

A: REMOVAL

CAUTION:

When replacing wiper blades or etc., be sure to stand up the driver side wiper arm first, then passenger side wiper arm next. Also, when putting the wiper arms back, be sure to start with passenger side first, then driver side next. Doing this in the reverse order may result in damage of passenger side wiper arm by hitting with driver side wiper blade.

- 1) Open the hood.
- 2) Remove the cap.
- 3) Remove the nut to remove wiper arm.

B: INSTALLATION

- 1) Install in the reverse order of removal.
- 2) Operate the wiper once.
- 3) Align the wiper blade to ceramic print point mark (A) of front window panel.

Tightening torque:

Refer to "COMPONENT" of "General Description".

<Ref. to WW-2, FRONT WIPER, COMPONENT, General Description.>

C: ADJUSTMENT

Operate the wiper once. Align the wiper blade to ceramic print point mark (A) of front window panel.

7. Front Wiper Motor and Link

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Remove the cowl panel. <Ref. to EI-39, REMOVAL, Cowl Panel.>
- 3) Disconnect the connector of wiper motor assembly.
- 4) Remove the bolt to remove wiper assembly.

NOTE:

Wiper motor and wiper link can not be disassembled, because those are assembly part.

B: INSTALLATION

Install in the reverse order of removal.

Tightening torque:

Refer to "COMPONENT" of "General Description".

<Ref. to WW-2, FRONT WIPER, COMPONENT, General Description.>

C: INSPECTION

- 1) When the battery is connected to the terminal of connectors, confirm that the wiper motor operates at low speed.

- 2) When the battery is connected to the terminal of connectors, confirm that the wiper motor operates at high speed.

- 3) Connect the battery to terminals of connector, and remove the terminal connection with wiper motor rotated at low speed, and stop the wiper motor through operation.

- 4) Connect the battery and confirm that the wiper motor stops at automatic stop position after the wiper motor operates at low speed again.

Front Washer Nozzle

WIPER AND WASHER SYSTEMS

8. Front Washer Nozzle

A: REMOVAL

- 1) Remove the front hood insulator. <Ref. to EB-13, FRONT HOOD INSULATOR, REMOVAL, Front Hood.>
- 2) Hold the pawl of washer nozzle (A) toward the arrow direction, and remove the washer nozzle.

- 3) Remove the washer hose from washer nozzle.

B: INSTALLATION

- 1) Install in the reverse order of removal.
- 2) Adjust the washer nozzle position. <Ref. to WW-16, ADJUSTMENT, Front Washer Nozzle.>

C: INSPECTION

- Make sure the nozzle and hose are not clogged.
- Make sure the hose is not bent.

D: ADJUSTMENT

- 1) Turn the wiper switch to OFF position.
- 2) While the vehicle is at standstill, adjust the washer injection position as shown in the figure.

Injection position:

A: 250 mm (9.84 in)

B: 435 mm (17.13 in)

- (1) Nozzle

Injection angle should be adjusted with 0.5 mm (0.020 in) thickness steel scale. Use maximum thickness of 0.5 mm steel scale, because the injection slit width of washer nozzle is 0.6 mm (0.024 in). Adjusting with a flat tip driver may damage the injection slit and cause the faulty injection.

- (1) Inside of washer nozzle injection
- (2) 0.6 mm (0.024 in)
- (3) Steel scale
- (4) Max. 0.5 mm (0.020 in)

9. Rear Wiper Arm

A: REMOVAL

- 1) Detach the wiper arm cover (A).
- 2) Remove the nut (B) to remove wiper arm.

B: INSTALLATION

- 1) Install in the reverse order of removal.
- 2) Operate the rear wiper once.
- 3) Align the blade with the marking (A) of glass.

Tightening torque:

Refer to "COMPONENT" of "General Description".

<Ref. to WW-3, REAR WIPER (WAGON MODEL), COMPONENT, General Description.>

C: ADJUSTMENT

- 1) Operate the rear wiper once.
- 2) Align the blade with the marking (A) of glass.

10.Rear Wiper Motor

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Remove the rear wiper arm. <Ref. to WW-17, REMOVAL, Rear Wiper Arm.>
- 3) Remove the rear gate lower trim. <Ref. to EI-68, REMOVAL, Rear Gate Trim.>
- 4) Disconnect the harness connector of wiper motor assembly.
- 5) Remove the bolts to remove wiper motor assembly (A).

B: INSTALLATION

- 1) Install in the reverse order of removal.
- 2) Be sure that the pivot cap with the arrow mark facing up, as shown in the figure.

Tightening torque:

Refer to "COMPONENT" of "General Description".

<Ref. to WW-3, REAR WIPER (WAGON MODEL), COMPONENT, General Description.>

C: INSPECTION

- 1) Connect the battery to wiper motor connector and confirm that wiper motor operates.

- 2) Connect the battery to terminals of connector, and remove the terminal connection with wiper motor rotated, and stop the wiper motor through operation.

- 3) Connect the battery and confirm that the wiper motor stops at automatic stop position after the wiper motor operates at low speed again.

11.Rear Washer

A: REMOVAL

- 1) Detach the roof spoiler. <Ref. to EI-40, REMOVAL, Roof Spoiler.>
- 2) Remove the washer hose from washer nozzle.
- 3) Push the pawl of nozzle from the reverse side of roof spoiler with a flat tip screwdriver or equivalent, and remove the washer nozzle.

B: INSTALLATION

Install in the reverse order of removal.

C: INSPECTION

- Make sure the nozzle and hose are not clogged.
- Make sure the hose is not bent.
- While the vehicle is at standstill, make sure the washer injection position as shown in the figure.

NOTE:

Washer injection position can not be adjusted.

- (1) Nozzle
- (A) 70 mm (2.76 in)
- (B) 70°

1. General Description

A: CAUTION

- Before disassembling or reassembling parts, always disconnect the battery ground cable. When replacing the audio, control unit, and other parts provided with memory functions, record the memory contents before disconnecting the battery ground cable. Otherwise, the memory will be erased.
- Reassemble the parts in the reverse order of disassembly unless otherwise indicated.
- Adjust parts to the given specifications.
- Connect the connectors securely during reassembly.
- After reassembly, make sure the functional parts operate smoothly.

B: PREPARATION TOOL

1. GENERAL TOOL

TOOL NAME	REMARKS
Circuit tester	Used for measuring resistance and voltage.
Conductive silver composition (DUPONT No. 4817 or equivalent)	Used for repairing antenna wire.

2. Audio System

A: WIRING DIAGRAM

<Ref. to WI-160, WIRING DIAGRAM, Audio System.>

B: INSPECTION

Symptom	Repair order
No power coming in. (No display and no sound from speakers)	(1) Check the fuse and power supply for audio. (2) Check the audio ground. (3) Remove the audio and repair it.
A specific speaker does not operate.	(1) Check the speaker. (2) Check the output circuit between audio and speaker.
Audio generates noise with engine running.	(1) Check the audio ground. (2) Check the generator. (3) Check the ignition coil. (4) Remove the audio and repair it.
AM and FM modes are weak or noisy.	(1) Check the antenna. (2) Check the antenna amplifier. (3) Check the noise suppressor. (4) Check the audio ground. (5) Remove the audio and repair it.

3. Front Accessory Power Supply Socket System

A: WIRING DIAGRAM

<Ref. to WI-162, WIRING DIAGRAM, Front Accessory Power Supply Socket System.>

4. Audio

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Remove the console box. <Ref. to EI-53, REMOVAL, Console Box.>
- 3) Remove the console front panel. <Ref. to EI-54, REMOVAL, Center Console.>
- 4) Remove the console side garnish. <Ref. to EI-54, REMOVAL, Center Console.>

- (A) Console front panel
(B) Console side garnish

- 5) Remove the screws, and slightly pull the audio out from center console.

- 6) Disconnect the harness connector and antenna feeder cord, and then remove the audio.

B: INSTALLATION

Install in the reverse order of removal.

5. Front Speaker

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Remove the front door trim. <Ref. to EI-48, REMOVAL, Door Trim.>
- 3) Remove the front speaker mounting screws.

- 4) Disconnect the harness connector and remove front speaker.

B: INSTALLATION

Install in the reverse order of removal.

6. Tweeter

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Remove the front door trim. <Ref. to EI-48, REMOVAL, Door Trim.>
- 3) Remove the tweeter mounting screws.

- 4) Disconnect the harness connector and remove tweeter.

B: INSTALLATION

Install in the reverse order of removal.

7. Rear Speaker

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Remove the rear door trim. <Ref. to EI-48, REMOVAL, Door Trim.>
- 3) Remove the rear speaker mounting screws.

- 4) Disconnect the harness connector and remove rear speaker.

B: INSTALLATION

Install in the reverse order of removal.

8. Woofer

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Remove the hooks (A) and detach woofer cover.
<Ref. to EI-62, REMOVAL, Rear Quarter Trim.>

- 3) Remove the quarter lower trim. <Ref. to EI-62, REMOVAL, Rear Quarter Trim.>
- 4) Remove the woofer bracket mounting clips (A) and screws, and then remove the woofer bracket.

- 5) Disconnect the harness connector and detach woofer.

B: INSTALLATION

Install in the reverse order of removal.

9. Antenna

A: INSPECTION

Measure the resistance between antenna terminal and each antenna wire.

If an antenna wire is OK, resistance will be less than 1 Ω . If an antenna wire is broken, resistance will be more than 1 M Ω .

NOTE:

When checking the continuity, wind a piece of aluminum foil around the tip of tester probe and press the foil against wire with your finger.

- (A) Tester probe
- (B) Aluminum foil
- (C) Antenna wire

To locate the broken point, move the probe along antenna wire.

B: REPAIR

1) Clean the antenna wire and surrounding area with a cloth dampened by alcohol.

2) Paste a thin masking film on the glass along broken wire.

3) Apply conductive silver composition (DUPONT No. 4817) on the broken portion with a drawing pen.

- (A) Broken portion
- (B) Masking film
- (C) Conductive silver composition

4) Dry out the deposited portion.

5) After repair has been completed, measure the resistance in repaired wire.

10. Antenna Amplifier

A: REMOVAL

1. SEDAN MODEL

- 1) Disconnect the ground cable from battery.
- 2) Remove the rear quarter trim. <Ref. to EI-62, SEDAN MODEL, REMOVAL, Rear Quarter Trim.>
- 3) Disconnect the harness connectors and terminals.
- 4) Remove the curtain airbag module. <Ref. to AB-20, REMOVAL, Curtain Airbag Module.>
- 5) Remove the screw and detach antenna amplifier.

2. WAGON MODEL

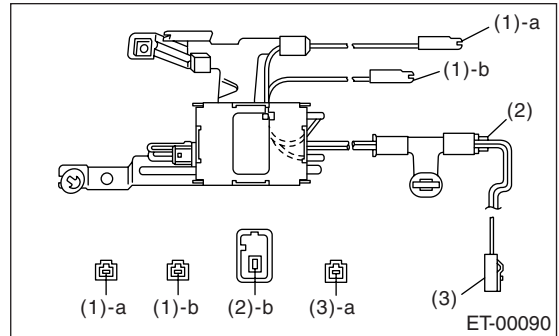

- 1) Disconnect the ground cable from battery.
- 2) Remove the rear gate trim. <Ref. to EI-68, REMOVAL, Rear Gate Trim.>
- 3) Disconnect the harness connectors and terminals.
- 4) Remove the screw and detach antenna amplifier.

C: INSPECTION

Measure the resistance of antenna amplifier.

- Sedan model

- Wagon model

Terminal No.	Standard
(1)-a and Amplifier body	More than 10 kΩ
(1)-b and Amplifier body	More than 10 kΩ
(2)-b and Amplifier body	More than 10 kΩ
(3)-a and Amplifier body	More than 10 kΩ

B: INSTALLATION

Install in the reverse order of removal.

11.Noise Suppressor

A: REMOVAL

1. SEDAN MODEL

- 1) Disconnect the ground cable from battery.
- 2) Remove the rear quarter trim. <Ref. to EI-62, SEDAN MODEL, REMOVAL, Rear Quarter Trim.>
- 3) Remove the curtain airbag module. <Ref. to AB-20, REMOVAL, Curtain Airbag Module.>
- 4) Disconnect the harness connector from noise suppressor.
- 5) Remove the harness clip.
- 6) Remove the screw and detach noise suppressor.

2. WAGON MODEL

- 1) Disconnect the ground cable from battery.
- 2) Remove the rear gate trim. <Ref. to EI-68, REMOVAL, Rear Gate Trim.>
- 3) Disconnect the harness connector from noise suppressor.
- 4) Remove the screws and detach noise suppressor.

B: INSTALLATION

Install in the reverse order of removal.

12. Front Accessory Power Supply Socket

A: REMOVAL

1. FRONT

- 1) Disconnect the ground cable from battery.
- 2) Remove the console front panel. <Ref. to EI-54, REMOVAL, Center Console.>
- 3) Disconnect the harness connector, and remove the accessory power supply socket.

2. REAR

- 1) Disconnect the ground cable from battery.
- 2) Remove the console box. <Ref. to EI-53, REMOVAL, Console Box.>
- 3) Disconnect the harness connector, and remove the accessory power supply socket.

B: INSTALLATION

Install in the reverse order of removal.

13. Steering Satellite Switch

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Set the tire to the straight-ahead position.
- 3) Remove the airbag module. <Ref. to AB-16, REMOVAL, Driver's Airbag Module.>

WARNING:

With the airbag module equipped, always refer to "Airbag System" when performing the airbag module repair service. <Ref. to AB-16, INSPECTION, Driver's Airbag Module.>

- 4) Remove the steering wheel. <Ref. to PS-14, REMOVAL, Steering Wheel.>
- 5) Remove the cover from steering wheel.
- 6) Remove each one of satellite switch mounting screw from the LH and RH side.

- 7) Remove the satellite switch.

B: INSTALLATION

Install in the reverse order of removal.

C: INSPECTION

	Step	Check	Yes	No
1	MUTE SWITCH CONTINUITY CHECK. 1) Press the mute switch. 2) Measure the resistance between satellite switch connector terminals. Terminals No. 1 — No. 2:	Is the resistance approx. 22 Ω ?	Go to step 2.	Replace the satellite switch.
2	VOLUME SWITCH CONTINUITY CHECK. 1) Press the volume switch. 2) Measure the resistance between satellite switch connector terminals. Terminals No. 1 — No. 2: Volume up No. 1 — No. 2: Volume down	Is the resistance approx. 90 Ω ? (Volume up) Is the resistance approx. 200 Ω ? (Volume down)	Go to step 3.	Replace the satellite switch.
3	MODE SWITCH CONTINUITY CHECK. 1) Press the mode switch. 2) Measure the resistance between satellite switch connector terminals. Terminals No. 1 — No. 2:	Is the resistance approx. 360 Ω ?	Go to step 4.	Replace the satellite switch.
4	SEEK SWITCH CONTINUITY CHECK. 1) Press the seek switch. 2) Measure the resistance between satellite switch connector terminals. Terminals No. 1 — No. 2: Seek up No. 1 — No. 2: Seek down	Is the resistance approx. 690 Ω ? (Seek up) Is the resistance approx. 1.5 k Ω ? (Seek down)	Go to step 5.	Replace the satellite switch.
5	CHECK SATELLITE SWITCH INSULATION. 1) Not to operate the satellite switch. 2) Measure the resistance between satellite switch connector terminals. Terminals No. 1 — No. 2:	Is the resistance approx. 4.7 k Ω ?	Satellite switch is normal.	Replace the satellite switch.

Steering Satellite Switch

ENTERTAINMENT

1. General Description

A: CAUTION

- Before disassembling or reassembling parts, always disconnect the battery ground cable from battery. When replacing audio, control module, and other parts provided with memory functions, record memory contents before disconnecting the battery ground cable. Otherwise, the memory will be erased.
- Reassemble in reverse order of disassembly, unless otherwise indicated.
- Adjust parts to the given specifications.
- Connect the connectors securely during reassembly.
- After reassembly, make sure functional parts operate smoothly.

B: PREPARATION TOOL

1. GENERAL TOOLS

TOOL NAME	REMARKS
Circuit tester	Used for measuring resistance and voltage.
TORX® BIT T30	Used for removing and installing driver's airbag module.

2. Horn System

A: WIRING DIAGRAM

1. HORN

<Ref. to WI-164, WIRING DIAGRAM, Horn System.>

B: INSPECTION

1. HORN RELAY

Measure the horn relay resistance between terminals (indicated in the table below) when connecting the terminal No. 4 to battery positive terminal and terminal No. 3 to battery ground terminal.

Current	Terminal No.	Standard
Flow	1 and 2	Less than 1 Ω
No Flow		More than 1 M Ω

3. Horn

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Remove the two clips and turn up the lower mud guard RH.

- 3) Remove the horn bracket mounting bolt (A).
- 4) Disconnect the harness connector and remove the horn assembly (B).

B: INSTALLATION

Install in the reverse order of removal.

C: INSPECTION

With 12 V direct current supplied between horn terminals, check that the horn sounds properly.

4. Horn Switch

A: REMOVAL

CAUTION:

Before servicing, be sure to read the notes in AB section for proper handling of driver's airbag module. <Ref. to AB-5, CAUTION, General Description.>

NOTE:

Horn switch is a unit with the driver's airbag module.

- 1) Disconnect the ground cable from battery.
- 2) Remove the driver's airbag module. <Ref. to AB-16, REMOVAL, Driver's Airbag Module.>

B: INSTALLATION

Install in the reverse order of removal.

C: INSPECTION

Measure the resistance between horn switch terminal and airbag module bracket.

- (1) Airbag module bracket
- (2) Horn switch terminal

Switch position	Terminal No.	Resistance
When horn switch is pushed	Horn switch terminal and airbag module bracket	Less than 1 Ω
When horn switch is not pushed		More than 1 M Ω

Horn Switch

COMMUNICATION SYSTEM

General Description

GLASS/WINDOWS/MIRRORS

1. General Description

Tightening torque: N-m (kgf-m, ft-lb)

T1: 1.9 (0.19, 1)

B: CAUTION

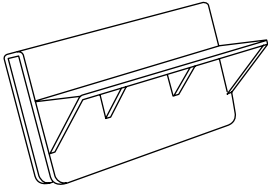

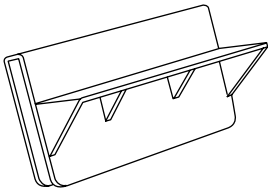

- When electrical connectors are disconnected, always conduct an operational check after connecting them again.
- Avoid impact and damage to the glass.

General Description

GLASS/WINDOWS/MIRRORS

C: PREPARATION TOOL

1. SPECIAL TOOL

ILLUSTRATION	TOOL NUMBER	DESCRIPTION	REMARKS
 <p>ST61299AE000</p>	61299AE000	SPACER	Used for adjusting the upper end position of front door glass. (Glass thickness: 5 mm (0.197 in))
 <p>ST61299AE010</p>	61299AE010	SPACER	Used for adjusting the upper end position of rear door glass. (Glass thickness: 4 mm (0.157 in))

2. GENERAL TOOL

TOOL NAME	REMARKS
Circuit tester	Used for checking voltage and continuity.
Piano wire	Used for removing the window glass.
Windshield glass knife	Used for removing the window glass.

Power Window System

GLASS/WINDOWS/MIRRORS

2. Power Window System

A: WIRING DIAGRAM

<Ref. to WI-165, Power Window System.>

B: INSPECTION

Symptom	Repair order
All power windows do not operate.	(1) Fuse (SBF-4) (2) Power window circuit breaker (3) Power window relay (4) Wiring harness (5) Body integrated unit
One window does not operate.	(1) Power window main switch (2) Power window sub switch (3) Power window motor (4) Wiring harness
"Window Lock" does not operate.	Power window main switch

3. Power Window Control Switch

A: REMOVAL

1. MAIN SWITCH

- 1) Disconnect the ground cable from battery.
- 2) Remove the front door trim. <Ref. to EI-48, REMOVAL, Door Trim.>
- 3) Disconnect the harness connector.
- 4) Remove the screws from the reverse side of front door trim to remove the power window main switch.

2. SUB SWITCH

- 1) Disconnect the ground cable from battery.
- 2) Remove the door trim. <Ref. to EI-48, REMOVAL, Door Trim.>
- 3) Disconnect the connector.
- 4) Remove the screws from the reverse side of door trim to remove the power window sub switch.

B: INSTALLATION

1. MAIN SWITCH

Install in the reverse order of removal.

2. SUB SWITCH

Install in the reverse order of removal.

C: INSPECTION

1. MAIN SWITCH

Measure switch resistance.

	Switch position	Terminal No.	Standard
Driver's seat	UP	10 and 2, 7 and 1	Less than 1 Ω
	OFF	2 and 7, 1 and 2	Less than 1 Ω
	DOWN	10 and 1, 7 and 2	Less than 1 Ω
	AUTO DOWN	10 and 1, 7 and 2	Less than 1 Ω

	Switch position	Terminal No.	Standard
Passenger's seat	UP	10 and 14, 7 and 11	Less than 1 Ω
	OFF	7 and 14, 7 and 11	Less than 1 Ω
	DOWN	10 and 11, 7 and 14	Less than 1 Ω

Power Window Control Switch

GLASS/WINDOWS/MIRRORS

	Switch position	Terminal No.	Standard
Rear seat RH	UP	10 and 13, 7 and 12	Less than 1 Ω
	OFF	7 and 13, 7 and 12	Less than 1 Ω
	DOWN	10 and 12, 7 and 13	Less than 1 Ω

	Switch position	Terminal No.	Standard
Rear seat LH	UP	10 and 8, 7 and 9	Less than 1 Ω
	OFF	7 and 8, 7 and 9	Less than 1 Ω
	DOWN	9 and 10, 7 and 8	Less than 1 Ω

Replace the main switch if faulty.

2. SUB SWITCH

Measure switch resistance.

	Switch position	Terminal No.	Standard
Passenger's seat and rear	UP	2 and 3, 4 and 5	Less than 1 Ω
	OFF	1 and 2, 4 and 5	Less than 1 Ω
	DOWN	1 and 2, 3 and 4	Less than 1 Ω

Replace the sub switch if faulty.

4. Front Door Glass

A: REMOVAL

- 1) Remove the front door trim. <Ref. to EI-48, REMOVAL, Door Trim.>
- 2) Remove the sealing cover. <Ref. to EB-20, REMOVAL, Front Sealing Cover.>
- 3) Remove the outer mirror assembly. <Ref. to GW-19, REMOVAL, Outer Mirror Assembly.>
- 4) Remove the clip (A), and remove the front end of weather strip.

- 5) Remove the gusset.

- 6) Remove the stabilizer.

- 7) Remove the clips (A), and remove the rear end of weather strip.

- 8) Remove the screw (A) from the rear end of weather strip outer to remove weather strip outer.

- 9) Remove the screws to remove guide assembly.
- 10) Operate the power window switch to move glass to position shown in the figure, and then remove the two nuts through service holes.

Front Door Glass

GLASS/WINDOWS/MIRRORS

11) Remove the door glass.

CAUTION:

- Since the gear may be disengaged, do not turn regulator in the closing direction after removal of the glass.
- Avoid impact and damage to the glass.

B: INSTALLATION

1) Install in the reverse order of removal.

CAUTION:

Make sure that glass stay is placed securely in sash.

2) Adjust the front door glass. <Ref. to GW-12, ADJUSTMENT, Front Door Glass.>

Tightening torque:

Refer to "COMPONENT" of "General Description". <Ref. to GW-4, FRONT DOOR GLASS, COMPONENT, General Description.>

C: ADJUSTMENT

NOTE:

Before adjustment, ensure that all adjusting bolts of stabilizer, upper stopper and sash are loose and door glass is raised so that it is in contact with weather strip.

- 1) Temporarily tighten one adjusting bolt on one side of rear sash at the midpoint of slotted hole in the inner panel.
- 2) Temporarily tighten the regulator B-channel in a position at the top of slotted hole.
- 3) Lower the door glass 10 — 15 mm (0.39 — 0.59 in) from fully closed position. While applying outward pressure of 45.0 ± 5.0 N (4.5 ± 0.5 kgf, 9.9 ± 1.1 lb) (F) to upper edge of glass above midpoint of two outer stabilizers, press the inner stabilizer at pres-

sure of 25 ± 5 N (2.5 ± 0.5 kgf, 5.5 ± 1.1 lb) to the glass, then secure it.

- (1) Fully closed position
- (2) Stabilizer
- (3) 10 — 15 mm (0.39 — 0.59 in)

4) For adjustment of clearance between front glass and center pillar cover, loosen the nuts (A), and move the glass sash back and forward until clearance becomes the value shown.

- (1) Adjust a line parallel
- (2) Sash
- (3) Inner panel

- (1) 11 mm (0.433 in)

5) To adjust the upper end and lower end of center pillar, loosen the stopper bolt (A) or nut (B) securing door sash, move the stopper position until the clearance between center pillar cover is equal.

CAUTION:
Perform the measurement of clearance between center pillar at less than 50 mm (1.969 in) from upper end of window glass.

- (1) Glass
- (2) Center pillar cover
- (3) Check point
- (4) 50 mm (1.969 in)
- (5) 11 mm (0.433 in)

6) Adjust so that the upper and lower ends of center pillar are the same size.

- (A) Glass tilts too far rearward
- (B) Glass tilts too far forward
- (1) Narrow
- (2) Wide
- (3) Stopper adjusting direction

Front Door Glass

GLASS/WINDOWS/MIRRORS

7) After adjusting the clearance between center pillar, up and down the glass several times to check glass contact to stopper when glass is fully closed. Adjust it to contact the front and rear stopper simultaneously.

- (1) Narrow
- (2) Wide
- (3) When the stopper of door sash (front) contacts first
- (4) When the stopper of door sash (rear) contacts first
- (5) Raise B channel
- (6) Lower B channel

8) For glass stroke adjustment, install the ST to glass, close the door, and raise the glass with regulator until positional relationship between glass and weather strip becomes as shown. And secure the glass so that the upper stopper correctly touches the glass holder.

ST 61299AE000 SPACER (Glass thickness: 5 mm (0.197 in) for front door glass)

- (1) 3.2 — 4.8 mm (0.126 — 0.189 in)
- (2) When reusing weather strip: 5.5 mm (0.217 in)
When replacing weather strip: 3.0 mm (0.118 in)
- (3) ST

For preventing wind noise, adjust the glass at the position where tip of gusset is raised up a little.

- (A) 0 — 1.5 mm (0 — 0.059 in)

9) After stabilizer adjustment, carry out the glass cohesion adjustment. First, visually ensure the positional relationship between retainer & molding and glass of the roof side, and then begin with rear sash adjustment. Install the ST to glass and adjust two adjusting bolts alternately step by step to obtain dimensions shown below (cross-section A).

NOTE:

If two nuts are loosened at the same time, the sash moves back and forth. Therefore, when one nut is adjusted, secure the other.

10) Make the same adjustment of two adjusting bolts of rear sash.

ST 61299AE000 SPACER (Glass thickness: 5 mm (0.197 in) for front door glass)

- (1) 3.2 — 4.8 mm (0.126 — 0.189 in)
- (2) When reusing weather strip: 5.5 mm (0.217 in)
When replacing weather strip: 3.0 mm (0.118 in)
- (3) ST

NOTE:

Do not tilt the sash bracket to inner panel during adjustment. Otherwise smooth regulator operation cannot be achieved.

- (1) Sash bracket
- (2) Rear sash
- (3) Adjust a line parallel
- (4) Sash
- (5) Inner panel

11) Make adjustment of front sash in the same manner as that of rear sash.

NOTE:

Although front and rear sashes must, as a rule, be adjusted in the same manner, in some door installation, the adjustment in a different manner may be required. However, adjustment of one sash to the maximum amount and the other to the minimum amount is not permitted. Such adjustment may result in application of excessive load to regulator.

12) After adjustments, tighten the nuts.

13) After adjustment of the glass, close the door. If there is a gap between outer lip of gusset and glass surface, adjust the gap with adjusting bolt (A) in lower fitting part of gusset to prevent generation of wind noise.

14) During adjustment, loosen the other three clamping bolts.

15) After adjustment, tighten the bolts and nuts.

5. Front Regulator and Motor Assembly

A: REMOVAL

- 1) Remove the door glass. <Ref. to GW-11, REMOVAL, Front Door Glass.>
- 2) Disconnect the motor connector.
- 3) Remove the four bolts and two nuts to remove regulator assembly.

- 4) Remove the screws to remove motor assembly.

NOTE:

When removing the motor assembly, secure the arm correctly, because the regulator arm moves in the force of balancing spring.

B: INSTALLATION

- 1) Install in the reverse order of removal.
- 2) Adjust the front door glass. <Ref. to GW-12, ADJUSTMENT, Front Door Glass.>

Tightening torque:

Refer to "COMPONENT" of "General Description". <Ref. to GW-4, FRONT DOOR GLASS, COMPONENT, General Description.>

C: INSPECTION

- 1) Make sure that the power window motor rotates properly when the battery voltage is applied to the terminals of motor connector.
- 2) Change polarity of battery connection to terminals to ensure that the motor rotates in reverse direction.

6. Remote Control Mirror System

A: WIRING DIAGRAM

<Ref. to WI-170, Remote Control Mirror System.>

B: INSPECTION

Symptom	Repair order
All function does not operate.	(1) Fuse (F/B No. 6) (2) Mirror switch (3) Wiring harness
One side of the mirror motor does not operate.	(1) Mirror switch (2) Mirror motor (3) Wiring harness
Mirror heater does not operate.	(1) Mirror switch (2) Mirror heater (3) Wiring harness

7. Scalp Cap

A: REPLACEMENT

1. MODEL WITH SIDE TURN SIGNAL LIGHT

- 1) Remove the mirror. <Ref. to GW-21, REPLACEMENT, Outer Mirror.>
- 2) Press-in the upper side clips (A) from inside of door mirror.

- 3) Pull the scalp cap forward of door mirror, remove the upper side clips (A) and lower side hooks (B), and then remove the scalp cap.

- 4) Insert the lower hooks (B) of scalp cap to door mirror and push the upper clips (A) in.

- 5) Install the scalp cap securely.

CAUTION:

Do not remove the scalp cap forcibly. The lower hooks may be damaged.

2. MODEL WITHOUT SIDE TURN SIGNAL LIGHT

- 1) Remove the mirror. <Ref. to GW-21, REPLACEMENT, Outer Mirror.>
- 2) Press-in the clips (A) from inside of door mirror.

- 3) Pull the scalp cap forward of door mirror, and then remove the scalp cap.

- 4) Mate the backside clip (A) of scalp cap with the clip hole of the outer mirror to install, and then push the scalp cap in.

- 5) Install the scalp cap securely.

8. Outer Mirror Assembly

A: REMOVAL

1) Remove the mirror gusset cover.

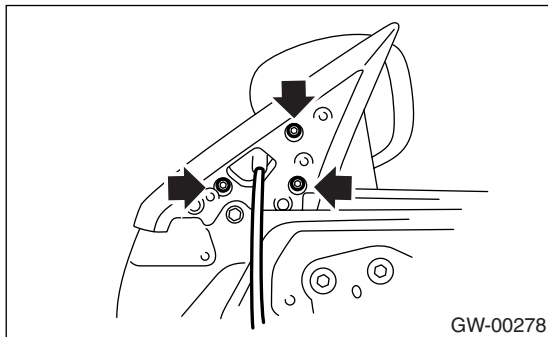

(1) Hook

2) Remove the door trim. <Ref. to EI-48, REMOVAL, Door Trim.>

3) Disconnect the mirror connector.

4) Remove the screws to remove mirror assembly.

B: INSTALLATION

Install in the reverse order of removal.

Outer Mirror Assembly

GLASS/WINDOWS/MIRRORS

C: INSPECTION

Check that the rearview mirror moves properly when the battery voltage is applied to terminals.

- Model with side turn signal light

Switch position	Terminal No.
OFF	—
UP	6 (+) and 3 (-) or 8 (-)
DOWN	3 (+) or 8 (+) and 6 (-)
LEFT	7 (+) and 3 (-) or 8 (-)
RIGHT	3 (+) or 8 (+) and 7 (-)

- Model without side turn signal light

Switch position	Terminal No.
OFF	—
UP	4 (+) and 2 (-) or 6 (-)
DOWN	2 (+) or 6 (+) and 4 (-)
LEFT	5 (+) and 6 (-) or 2 (-)
RIGHT	6 (+) or 2 (+) and 5 (-)

Replace the outer mirror assembly if defective.

9. Outer Mirror

A: REPLACEMENT

- 1) Face the mirror upward.
- 2) Use a flat tip screwdriver to remove clip (A).
- 3) Lift the lower mirror up to remove hooks (B).

- 4) Disconnect the mirror heater connector from the end of mirror. (Model with mirror heater)

- 5) Catch the hooks (B) and install clips (A).

CAUTION:

- When removing the mirror, be careful not to damage the back side of mirror with a flat tip screwdriver.
- When installing the mirror, insert the hook and clip securely.

10. Remote Control Mirror Switch

A: REMOVAL

- 1) Remove the instrument panel lower cover. <Ref. to EI-50, REMOVAL, Instrument Panel Lower Cover.>
- 2) Disconnect the connector.

- 3) Remove the remote control mirror switch from instrument panel lower cover.

B: INSTALLATION

Install in the reverse order of removal.

C: INSPECTION

1. REMOTE CONTROL MIRROR SWITCH

Move the remote control mirror switch to each position and check continuity between terminals.

- Change over switch R

Switch position	Terminal No.	Standard
OFF	—	More than 1 MΩ
UP	10 and 12, 15 and 14	Less than 1 Ω
DOWN	10 and 15, 12 and 14	Less than 1 Ω
LEFT	10 and 11, 15 and 14	Less than 1 Ω
RIGHT	10 and 15, 11 and 14	Less than 1 Ω

- Change over switch L

Switch position	Terminal No.	Standard
OFF	—	More than 1 MΩ
UP	10 and 8, 15 and 14	Less than 1 Ω
DOWN	10 and 15, 8 and 14	Less than 1 Ω
LEFT	10 and 9, 15 and 14	Less than 1 Ω
RIGHT	10 and 15, 9 and 14	Less than 1 Ω

Replace the remote control mirror switch if defective.

Rear Door Glass

GLASS/WINDOWS/MIRRORS

11. Rear Door Glass

A: REMOVAL

- 1) Remove the rear door trim. <Ref. to EI-48, REMOVAL, Door Trim.>
- 2) Remove the sealing cover. <Ref. to EB-24, REMOVAL, Rear Sealing Cover.>
- 3) Remove the stabilizer.

- 4) Remove the clips (A), and remove the front end and rear end of weather strip.

- 5) Loosen the two screws to remove weather strip outer.

- 6) Operate the power window switch to move the glass to position shown in the figure, and then remove the two nuts through service holes.

- 7) Remove the rear sash retaining nuts (A) and move rear sash (B) backward.

- 8) Remove the door glass.

CAUTION:

- Since the gear may be disengaged, do not turn regulator in the closing direction after removal of the glass.
- Avoid impact and damage to the glass.

B: INSTALLATION

1) Install in the reverse order of removal.

CAUTION:

Make sure that glass stay is placed securely in sash.

2) Adjust the rear door glass. <Ref. to GW-25, ADJUSTMENT, Rear Door Glass.>

Tightening torque:

Refer to “COMPONENT” of “General Description”. <Ref. to GW-5, REAR DOOR GLASS, COMPONENT, General Description.>

C: ADJUSTMENT

NOTE:

The rear door glass, as a rule, should be adjusted in the same manner as front door glass, although they are different in dimension. <Ref. to GW-12, ADJUSTMENT, Front Door Glass.>

1) Adjust the glass position using the following dimensions as a guide line.

(1) 11 mm (0.433 in)

NOTE:

- If dimensions are smaller than the given dimensions, glass may get caught in weather strip during lifting/lowering operation and may not be fully open.
- After adjustment, move the glass up and down to check whether it is caught.

2) Install the ST to glass and adjust the glass adhesion to the value shown.

ST 61299AE010 SPACER (Glass thickness: 4 mm (0.157 in) for rear door glass)

- (1) 3.2 — 4.8 mm (0.126 — 0.189 in)
- (2) When reusing weather strip: 5.5 mm (0.217 in)
When replacing weather strip: 5.0 mm (0.197 in)
- (3) ST

NOTE:

- If rear glass adhesion is higher than necessary, glass may get caught in weather strip of center pillar corner, resulting in early wear of weather strip. Care should be taken for adjustment.
- After adjustment, move the glass up and down to check whether it is caught.

Rear Regulator and Motor Assembly

GLASS/WINDOWS/MIRRORS

12. Rear Regulator and Motor Assembly

A: REMOVAL

- 1) Remove the rear door glass. <Ref. to GW-24, REMOVAL, Rear Door Glass.>
- 2) Remove the nut (A) to remove front sash.

- 3) Disconnect the motor connector.
- 4) Remove the four bolts and two nuts to remove regulator assembly.

- 5) Remove the screws to remove motor assembly.

B: INSTALLATION

- 1) Install in the reverse order of removal.
- 2) Adjust the rear door glass. <Ref. to GW-25, ADJUSTMENT, Rear Door Glass.>

Tightening torque:

Refer to "COMPONENT" of "General Description". <Ref. to GW-5, REAR DOOR GLASS, COMPONENT, General Description.>

C: INSPECTION

- 1) Make sure that the power window motor rotates properly when the battery voltage is applied to the terminals of motor connector.
- 2) Change polarity of battery connection to terminals to ensure that the motor rotates in reverse direction.

13. Windshield Glass

A: REMOVAL

1. USING WINDSHIELD GLASS KNIFE

- 1) Remove the cowl panel. <Ref. to EI-39, REMOVAL, Cowl Panel.>
- 2) Remove the molding.
- 3) Tape the body side of the circumference of windshield glass for protection.
- 4) Apply sufficient amount of soapy water to the adhesive part.
- 5) Insert the windshield glass knife into adhesive part.
- 6) While holding the knife edge and windshield glass edge at a right angle, move the windshield glass knife in parallel to the windshield glass edge along face and edge of windshield glass to cut the adhesive part.

NOTE:

- Do not twist windshield glass knife.
- Cutting of adhesive part shall be started with wider gap between windshield glass and body.

- (1) Windshield glass knife
- (2) Tape for protection
- (3) Locating pin

- Because the locating pins are bonded to the corners of glass, use piano wire to cut the pin.

- (1) Locating pin
- (2) Body panel
- (3) Windshield glass

2. USING PIANO WIRE

- 1) Remove the cowl panel. <Ref. to EI-39, REMOVAL, Cowl Panel.>
- 2) Remove the molding.
- 3) Tape the body side of the circumference of windshield glass for protection.
- 4) Make a hole in the adhesive part using drill or knife.
- 5) Pass the piano wire through the hole, and attach securely both the wire ends to pieces of wood.

- 6) Pull the wire ends alternately to cut off the adhesive part.

CAUTION:

- Do not tightly pull the piano wire against the windshield glass edge.
- Be careful not to damage interior and exterior parts.
- When removal is made with area close to instrument panel, place a protection plate over it. Pay particular attention to the removal.
- Do not cross piano wires. Otherwise they may be cut.

Windshield Glass

GLASS/WINDOWS/MIRRORS

B: INSTALLATION

- 1) Clean the external circumference of windshield glass with alcohol or white gasoline.
- 2) Remove the adhesive layer on the body using cutter knife to obtain smooth face of 2 mm (0.08 in) thick.

CAUTION:

Be careful not to damage the body and paint surface.

- (1) Adhesive
- (2) 2 mm (0.08 in)
- (3) Dam rubber
- (4) Glass

- 3) Clean the body with alcohol or white gasoline to eliminate cutting power, dust and dirt completely from body.
- 4) Install the dam rubber.
- 5) Fit molding mark (B) to notch (A) of glass side and install the molding to entire perimeter of glass.

- 6) Apply two types of primers to the adhesive layer of glass using sponge.

Glass primer:

**Dow Automotive
ESSEX U-401, U-402**

- 7) Apply primer to the adhesive layer of body.

Painted surface primer:

**Dow Automotive
ESSEX U-413**

NOTE:

- Primer once attached to the painted surface of the body and internal trim is hard to wipe off. Mask the circumference of such area.
- Let primer dry for about ten minutes before installing the glass.
- Do not touch the surface coated with primer.

- (1) Application of primer
- (2) Glass side
- (3) Body side

- 8) Cut off the cartridge nozzle tip as shown and set it in sealant gun.

- (1) 10 mm (0.39 in)
- (2) 15 mm (0.59 in)

9) Apply adhesive to the glass end surface as shown.

Adhesive:

**Dow Automotive
ESSEX U-400HV or equivalent**

(1) 9 — 12 mm (0.35 — 0.47 in)

10) Fit the locating pins, and install windshield glass using suction rubber cup.

- 11) Lightly press the windshield glass for tight fit.
- 12) Make flush the adhesive surface juttred out using spatula.
- 13) After completion of all work, allow the vehicle to stand for about 24 hours.

NOTE:

- When door is opened/closed after glass is bonded, always lower the door glass and then open/close it carefully.
- Move the vehicle slowly.
- For minimum drying time and vehicle standing time before driving after bonding, follow instructions or instruction manual from the adhesive manufacturer.

14) After curing of adhesive, pour the water on external surface of vehicle to check that there are no water leaks.

NOTE:

When a vehicle is returned to the user, tell him or her that the vehicle should not be subjected to heavy impact for at least three days.

15) Install the cowl panel. <Ref. to EI-39, INSTALLATION, Cowl Panel.>

14. Rear Gate Glass

A: REMOVAL

- 1) Remove the rear wiper motor. <Ref. to WW-18, REMOVAL, Rear Wiper Motor.>
- 2) Disconnect the electrical connectors from rear defogger terminal.
- 3) Remove the glass in the same procedure as for windshield glass. <Ref. to GW-27, REMOVAL, Windshield Glass.>

B: INSTALLATION

- 1) Apply adhesive in the same procedure as for windshield glass. <Ref. to GW-28, INSTALLATION, Windshield Glass.>
- 2) Insert the glass clip pin into rear gate hole, and after pushing on the area around the clip pin to secure it, push lightly all around the area to seal it.
- 3) About one hour after installation, conduct a leak test.

NOTE:

- When door is opened/closed after glass is bonded, always lower the door glass and then open/close it carefully.
 - Move the vehicle slowly.
 - For minimum drying time and vehicle standing time before driving after bonding, follow instructions or instruction manual from the adhesive manufacturer.
 - When a vehicle is returned to the user, tell him or her that the vehicle should not be subjected to heavy impact for at least three days.
- 5) Connect the rear defogger terminals.
 - 6) Install the rear wiper. <Ref. to WW-18, INSTALLATION, Rear Wiper Motor.>

- (1) Upside
- (2) Molding
- (3) Glass
- (4) Adhesive
- (5) Downside
- (6) Glass
- (7) Molding
- (8) Adhesive

- 4) After completion of all work, allow the vehicle to stand for about 24 hours.

15. Rear Window Glass

A: REMOVAL

- 1) Disconnect the electrical connectors from rear defogger terminal.
- 2) Remove the glass in the same procedure as for windshield glass. <Ref. to GW-27, REMOVAL, Windshield Glass.>

B: INSTALLATION

- 1) Bond the dam rubber.

- (1) Locating pin (bonded)
- (2) Dam rubber
- (3) 11 mm (0.433 in)
- (4) 4 mm (0.157 in)
- (5) Rear window glass
- (6) 40 mm (1.575 in)

- 2) Install the glass in the same procedure as for windshield glass. <Ref. to GW-28, INSTALLATION, Windshield Glass.>
- 3) Connect the connector to the rear defogger and antenna terminals.
- 4) After completion of all work, allow the vehicle to stand for about 24 hours.

NOTE:

- When door is opened/closed after glass is bonded, always lower the door glass and then open/close it carefully.
- Move the vehicle slowly.

- For minimum drying time and vehicle standing time before driving after bonding, follow instructions or instruction manual from the adhesive manufacturer.

- 5) After curing of adhesive, pour the water on external surface of vehicle to check that there are no water leaks.

NOTE:

When a vehicle is returned to the user, tell him or her that the vehicle should not be subjected to heavy impact for at least three days.

Rear Window Defogger System

GLASS/WINDOWS/MIRRORS

16.Rear Window Defogger System

A: WIRING DIAGRAM

<Ref. to WI-169, Rear Defogger System.>

B: INSPECTION

Symptom	Repair order
Rear window defogger does not operate.	(1) Fuse (M/B No. 10) (F/B No. 22) (2) Rear defogger relay (3) Defogger switch (4) Rear defogger condenser (5) Defogger wire (6) Wiring harness (7) Body integrated unit

NOTE:

Rear window defogger system can be customized on the Subaru Select Monitor.

System name	Initial setting	Customize setting
Rear window defogger timer	OFF after 15 min.	Repeat 15 min. operation and 2 min. stop.

17.Rear Window Defogger

A: INSPECTION

1. WITH SUBARU SELECT MONITOR

CAUTION:

Check that the rear window defogger timer is in initial setting or customize setting before inspection.

Step	Check	Yes	No
1 CHECK INPUT SIGNAL TO BODY INTEGRATED UNIT. When the rear window defogger switch is operated, check the input signal using Subaru Select Monitor. 1) Connect the Subaru Select Monitor to data link connector. 2) Turn the ignition switch to ON. 3) Select {Body Integrated Unit} from «Main Menu». 4) Select {Current Data Display & Save}. 5) When the rear window defogger switch is set to ON, check the input signal.	After rear defogger switch is set to ON, does it turn to OFF in 15 minutes? Or does it repeat 15 minutes operation and 2 minutes stop?	END.	Replace the body integrated unit. <Ref. to SL-54, REMOVAL, Body Integrated Unit.>

2. HEAT WIRE INSPECTION

CAUTION:

When wiping stain on glass off with cloth, use a dry and soft cloth and move it along the heat wire to avoid damage to the heat wire.

- 1) Turn the ignition switch to ON.
- 2) Turn the defogger switch to ON.
- 3) Wrap the tips of tester probe with aluminum foil to avoid damage to heat wire.

- (1) Tester probe
- (2) Aluminum foil
- (3) Heat wire
- (4) Push

4) Measure the voltage at heat wire center with DC voltmeter.

Standard voltage:
Approx. 6 V

(1) Center of heat wire

Voltage	Criteria
Approx. 6 V	Normal Operation
Approx. 12 V or 0 V	Broken

NOTE:

- If the measured value is 12 volts, heat wire is open between heat wire center and positive (+) terminal of tester probe.
- If zero volt, heat wire is open between wire center and ground.

5) Connect the tester probe of positive lead of voltmeter to positive terminal of heat wire and move tester probe of negative lead along the heat wire up to the negative terminal end. If voltage changes from zero to several volts during movement of tester probe, heat wire is open at the voltage change point.

Rear Window Defogger

GLASS/WINDOWS/MIRRORS

B: REPAIR

- 1) Clean the broken portion with alcohol or white gasoline.
- 2) Mask both side of wire with thin film.
- 3) Apply the conductive silver composition (DUPONT No. 4817) to the broken portion.

- (1) Broken portion
- (2) Thin film
- (3) Broken wire
- (4) Conductive silver composition (DUPONT No. 4817)

- 4) After repair, check the wire.

18.Rear Quarter Glass

A: REMOVAL

Remove the glass in the same procedure as for windshield glass. <Ref. to GW-27, REMOVAL, Windshield Glass.>

- (1) Locating pin
- (2) Dam rubber

B: INSTALLATION

1) Install the dam rubber.

- (1) Dam rubber
- (2) Molding
- (3) 10.5 mm (0.413 in) (constant)
- (4) Ceramic terminal

2) Cut out the nozzle head and apply adhesive to the glass end surface as shown.

- (1) Locating pin
- (2) Dam rubber
- (3) Adhesive
- (4) Molding
- (5) 8 — 10 mm (0.31 — 0.39 in)
- (6) 15 mm (0.59 in)
- (7) 10 mm (0.39 in)

3) Install the glass in the same procedure as for windshield glass. <Ref. to GW-28, INSTALLATION, Windshield Glass.>

4) After completion of all work, allow the vehicle to stand for about 24 hours.

NOTE:

- When door is opened/closed after glass is bonded, always lower the door glass and then open/close it carefully.
- Move the vehicle slowly.
- For minimum drying time and vehicle standing time before driving after bonding, follow instructions or instruction manual from the adhesive manufacturer.

5) After curing of adhesive, pour the water on external surface of vehicle to check that there are no water leaks.

NOTE:

When a vehicle is returned to the user, tell him or her that the vehicle should not be subjected to heavy impact for at least three days.

19.Sun Roof Glass

A: REMOVAL

<Ref. to SR-5, REMOVAL, Glass Lid.>

B: INSTALLATION

<Ref. to SR-6, INSTALLATION, Glass Lid.>

C: ADJUSTMENT

<Ref. to SR-6, ADJUSTMENT, Glass Lid.>

20. Rearview Mirror

A: REMOVAL

- 1) Remove the TORX[®] screw (1).
- 2) Slide the rearview mirror (2) to the upper side of windshield glass (3), and remove the rearview mirror (2) from button (4).

CAUTION:

- Be careful not to damage the mirror surface.
- Be careful not to damage the windshield glass.

B: INSTALLATION

Install in the reverse order of removal.

Tightening torque:

Refer to "Component" of "Description".

<Ref. to GW-6, MIRROR, COMPONENT, General Description.>

CAUTION:

When tightening the mounting TORX[®] screw, be sure to observe the tightening torque. Otherwise, the mount may be damaged.

C: INSPECTION

Check that the mirror is not damaged.
Check that the spring is not damaged.

Wiper Deicer System

GLASS/WINDOWS/MIRRORS

21. Wiper Deicer System

A: WIRING DIAGRAM

<Ref. to WI-159, Wiper Deicer System.>

B: INSPECTION

Symptom	Repair order
Wiper deicer does not operate.	(1) Fuse (F/B No. 4, 9) (2) Wiper deicer relay (3) Wiper deicer switch (4) Wiring harness (5) Body integrated unit

Refer to “Rear Window Defogger” for inspection.

<Ref. to GW-33, INSPECTION, Rear Window Defogger.>

NOTE:

Wiper deicer system can be customized on the Subaru Select Monitor.

System name	Initial setting	Customize setting
Wiper deicer timer	OFF after 15 min.	Continuous operation*

*: When one of following items is occurred, finish the continuous operation and goes to OFF after 15 min.

- Ambient temperature that is more than 5°C (41°F) continues for 10 sec.
- Malfunction occurs on ambient temperature sensor
- Vehicle speed that is below 15 km/h (9 MPH) continues 15 min.
- Malfunction occurs on CAN communication

C: REPAIR

Refer to “Rear Window Defogger” for repair.

<Ref. to GW-34, REPAIR, Rear Window Defogger.>

22. Wiper Deicer Switch

A: REMOVAL

- 1) Remove the instrument panel lower cover. <Ref. to EI-50, REMOVAL, Instrument Panel Lower Cover.>
- 2) Disconnect the harness connector and remove the wiper deicer switch.

B: INSTALLATION

Install in the reverse order of removal.

C: INSPECTION

1. WITH SUBARU SELECT MONITOR

CAUTION:

Check that the wiper deicer timer is in initial setting or customize setting before inspection.

Step	Check	Yes	No
1 CHECK INPUT SIGNAL TO BODY INTEGRATED UNIT. When the wiper deicer switch is operated, check the input signal using Subaru Select Monitor. 1) Connect the Subaru Select Monitor to data link connector. 2) Turn the ignition switch to ON. 3) Select {Body Integrated Unit} from «Main Menu». 4) Select {Current Data Display & Save}. 5) When the wiper deicer switch is set to ON, check the input signal.	After the wiper deicer switch is set to ON, does it turn to OFF in 15 minutes? Or does it operates continuously?	END.	Replace the body integrated unit. <Ref. to SL-54, REMOVAL, Body Integrated Unit.>

Wiper Deicer Switch

GLASS/WINDOWS/MIRRORS

2. CHECK SWITCH

Remove the wiper deicer switch and measure the switch resistance.

Switch position	Terminal No.	Standard
OFF	1 and 2	More than 1 M Ω
ON		Less than 1 Ω

Replace the wiper deicer switch if faulty.

General Description

BODY STRUCTURE

1. General Description

A: PREPARATION TOOL

TOOL NAME	REMARKS
Tram tracking gauge	Used for measuring dimension.
Tape measure	Used for measuring dimension.

2. Datum Dimensions

A: MEASUREMENT

NOTE:

- Using a tram tracking gauge, measure all the dimensions.
- When using a tape measure, carefully measure dimensions without letting the tape measure sag or twist.
- Measure the linear dimensions between cores of holes.
- Suffixes “RH” and “LH” indicate right-hand and left-hand.

(1) Tram tracking gauge

- Measure at the center of the circle around the outside of the body panel.

- (1) Datum point
- (2) Body panel
- (3) Outside

1. CENTER STRUCTURE

NOTE:

- The longitudinal dimensions are projected dimensions.
- The height dimensions are the vertical distances from the gauge point on the assumed horizontal line through the side sill flange joint (bending angle point).
- Diagonal dimensions are the actual dimensions between reference points. The values in brackets are projected dimensions for reference.

B: CAUTION

- Be careful not to damage the meters and instrument panel.
- Be careful not to damage the meter glass.
- Make sure the electrical connector is connected securely.
- After installation, make sure that each meter operates normally.
- Use gloves to avoid damage and getting fingerprints on the glass surface and meter surfaces.
- Do not apply an excessive force on the printed circuit.
- Do not drop or otherwise apply impact.
- When the combination meter of model with immobilizer has been replaced, be sure to perform the registration procedure of immobilizer.

C: PREPARATION TOOL

1. GENERAL TOOL

TOOL NAME	REMARKS
Circuit tester	Used for measuring resistance and voltage.

2. Combination Meter System

A: WIRING DIAGRAM

1. COMBINATION METER

<Ref. to WI-171, WIRING DIAGRAM, Combination Meter System.>

B: INSPECTION

1. SELF-DIAGNOSIS

The self-diagnosis (checking of each meter, warning light, indicator, illumination, LCD, buzzer sound) of combination meter can be performed in the following procedure.

1) Connect the diagnostic connector (A) near the fuse & relay box.

2) Turn the ignition switch to ON.

3) While meter indicator needle deflecting, press the odo/trip meter knob twice.

NOTE:

When odo/trip meter knob is pressed only once, display mode is shifted to DTC display mode. <Ref. to IDI-11, DTC DISPLAY MODE, INSPECTION, Combination Meter System.>

When the self-diagnosis function is operated, the checking of warning light, indicator, and LCD display is performed, hereafter, every pressing the odo/trip meter knob, the operation check is performed in the order of meter, illumination and buzzer. <Ref. to IDI-4, LIST OF SELF-DIAGNOSIS MODE OPERATION, INSPECTION, Combination Meter System.> To cancel the self-diagnosis mode, set the ignition switch to OFF or disconnect the diagnosis connector.

NOTE:

When the engine starts during diagnosis, the self-diagnosis mode is not cancelled, however, once the vehicle starts driving, the self-diagnosis mode is cancelled automatically for safety.

Combination Meter System

INSTRUMENTATION/DRIVER INFO

2. LIST OF SELF-DIAGNOSIS MODE OPERATION

Speedometer, tachometer, fuel gauge, water temperature gauge	Microcomputer running type warning light, indicator light	AT select lever position indicator light	Odo/Trip indicator	SPORT shift indicator	Illumination (indicator needle, plate, ring, LCD)	Buzzer (SPORT shift buzzer)
Step 0. Processing to self-diagnosis mode						
Operating initial operation	Initial illuminating	Normal	Normal	Initial illuminating	Initial illuminating	Not beep.
Step 1-1. Check each indication after initial operation						
Repeat the sweep operation (After holding on lowest position for one second, reaches to highest position within 5 seconds, and after holding on highest position for one second, reaches to lowest position within 5 seconds).	Light ON	With the highest brightness, illuminate the position sequentially at a cycle of 1.5 seconds.	Perform the segment check. For the illumination order, refer to the illumination order table.	Perform the segment check. For the illumination order, refer to the illumination order table.	Light at the highest brightness.	Not beep.
Step 1-2. Press the trip knob (trip knob input is not accepted till the meter indicator needle reaches the highest position): sweep complete, AT select lever position indicator display is set						
After completing sweep in step 1-1, back to lowest position.	Light ON	Keep the position indicated when the trip knob is pressed.	Underbar “_” is displayed.	“1” is displayed.	Light at the highest brightness.	Not beep.
Step 2-1. Press the trip knob, and hold it: Check each meter						
All meters are moved simultaneously in every 0.5 sec. from the lowest position to highest position. Speedometer/Tachometer: Approx. 5 degrees at every movement. Water temperature gauge/Fuel gauge: Approx. 2 degrees at every movement.	Light OFF	Keep the position indicated that set in step 1-2.	Display the current meter directing angle on odometer. Ex.) Display “135054” when Speedometer/Tachometer: 135 degree, Water temperature gauge/Fuel gauge: 54 degree.	“▼2” is displayed.	Light at the highest brightness.	Not beep.
Step 2-2. Release the trip knob: Specifying the meter directing position						
Stop at directing position when the trip knob is released.	Light OFF	Keep the position indicated that specified at step 1-2.	Display the current meter directing angle on odometer.	“2” is displayed.	Light at the highest brightness.	Not beep.
Step 3-1. Press the trip knob, and hold it: Check illumination						

Combination Meter System

INSTRUMENTATION/DRIVER INFO

Speedometer, tachometer, fuel gauge, water temperature gauge	Microcomputer running type warning light, indicator light	AT select lever position indicator light	Odo/Trip indicator	SPORT shift indicator	Illumination (indicator needle, plate, ring, LCD)	Buzzer (SPORT shift buzzer)
Keep the position that specified at step 2-2.	Light OFF	Varying from the highest brightness (ILL6) to the lowest luminance (ILL1) every second. After reaching at ILL1, repeat it from ILL6.	Illumination brightness is displayed. (From ILL6 to ILL1)	"▼3" is displayed.	Varying from the highest brightness (ILL6) to the lowest luminance (ILL1) every second. After reaching at ILL1, repeat it from ILL6.	Not beep.
Step 3-2. Release the trip knob: Specifying the illumination brightness						
Keep the position that specified at step 2-2.	Light OFF	Keep the brightness at the time when the trip knob is released.	Display the brightness at the time when the trip knob is released.	"3" is displayed.	Keep the brightness at the time when the trip knob is released.	Not beep.
Step 4-1. Press the trip knob: Check the beeping of SPORT shift buzzer (AT model)						
All meter indicator needle returns to lowest position.	Light OFF	Light at the highest brightness. Keep the position indicated that set in step 1-2.	Illumination brightness is displayed.	"▲▼8" is displayed. Blinks with buzzer.	Light at the highest brightness.	SPORT shift buzzer beeps.
Step 4-2. Press the trip knob: Check the VDC indicator light (Model with VDC)						
All meter indicator needle returns to lowest position.	VDC warning light and VDC operation indicator light blink.	Light at the highest brightness. Keep the position indicated that set in step 1-2.	Illumination brightness is displayed.	"4" is displayed.	Light at the highest brightness.	Not beep.
Step 5. Press the trip knob: Complete the self-diagnosis 1 cycle						
All meter indicator needle returns to lowest position, and go back to step 1 after completion.						

• **Illuminating order table**

Illuminating order	1	2	3	4	5	6	7	8	9	10	11	
Trip meter A/B	AB	A	B	A	B	A	B	A	B	A	B	Go back to 1 and repeat

Combination Meter System

INSTRUMENTATION/DRIVER INFO

3. SYMPTOM CHART

Symptom	Repair order	Reference
Combination meter assembly does not operate.	(1) Power supply (2) Ground circuit (3) Combination meter	<Ref. to IDI-7, CHECK POWER SUPPLY AND GROUND CIRCUIT, INSPECTION, Combination Meter System.>
Speedometer does not operate.	(1) ABSCM or VDCCM (2) Harness (3) Combination meter	<Ref. to IDI-7, CHECK ABSCM OR VDCCM, INSPECTION, Combination Meter System.>
Tachometer does not operate.	(1) ECM (2) Harness (3) Combination meter	<Ref. to IDI-8, CHECK ENGINE CONTROL MODULE, INSPECTION, Combination Meter System.>
Fuel gauge does not operate.	(1) Communication circuit (2) Fuel level sensor (3) Harness (4) Combination meter	<Ref. to IDI-9, CHECK FUEL LEVEL SENSOR., INSPECTION, Combination Meter System.>
Water temperature gauge does not operate.	(1) Communication circuit (2) Engine coolant temperature sensor (3) Harness (4) Combination meter	<Ref. to IDI-10, CHECK ENGINE COOLANT TEMPERATURE SENSOR., INSPECTION, Combination Meter System.>
Error display is shown on the odo/trip meter.	Communication circuit	<Ref. to IDI-11, COMMUNICATION ERROR DISPLAY, INSPECTION, Combination Meter System.>

CAUTION:

When measuring the voltage and resistance of each control module or sensor, use a tapered pin with a diameter of less than 0.64 mm (0.025 in) in order to avoid poor contact. Do not insert the pin of more than 2 mm (0.08 in) in diameter.

Combination Meter System

INSTRUMENTATION/DRIVER INFO

4. CHECK POWER SUPPLY AND GROUND CIRCUIT

Step	Check	Yes	No
1 CHECK POWER SUPPLY FOR COMBINATION METER. 1) Remove the combination meter. <Ref. to IDI-15, REMOVAL, Combination Meter.> 2) Disconnect the combination meter harness connector. 3) Turn the ignition switch to ON. 4) Measure the voltage between combination meter connector and chassis ground. Connector & terminal <i>(i10) No. 3, No. 4 (+) — Chassis ground (-):</i>	Is the voltage more than 10 V?	Go to step 2.	Check the harness for open or short between the ignition switch and combination meter.
2 CHECK POWER SUPPLY FOR COMBINATION METER. Measure the voltage between combination meter connector and chassis ground. Connector & terminal <i>(i10) No. 1, No. 2 (+) — Chassis ground (-):</i>	Is the voltage more than 10 V?	Go to step 3.	Check the harness for open or short between the fuse and combination meter.
3 CHECK GROUND CIRCUIT OF COMBINATION METER. 1) Turn the ignition switch to OFF. 2) Measure the resistance of harness between combination meter connector and chassis ground. Connector & terminal <i>(i10) No. 11, No. 12 — Chassis ground:</i>	Is the resistance less than 10 Ω ?	Replace the meter case assembly.	Repair the wiring harness.

5. CHECK ABSCM OR VDCCM

Step	Check	Yes	No
1 CHECK VEHICLE SPEED SIGNAL. 1) Lift up the vehicle and support it with rigid racks. 2) Drive the vehicle faster than 10 km/h (6 MPH). Warning: Be careful not to get caught in the running wheels. 3) Measure the voltage between combination meter connector and chassis ground. Connector & terminal <i>(i10) No. 19 (+) — Chassis ground (-):</i>	Is the voltage less than 1 V \leftrightarrow 5 V or more?	Replace the meter case assembly.	Go to step 2.
2 CHECK HARNESS BETWEEN ABSCM OR VDCCM AND COMBINATION METER. 1) Turn the ignition switch to OFF. 2) Disconnect the connector from ABSCM or VDCCM and combination meter. 3) Measure the resistance between ABSCM or VDCCM harness connector and combination meter harness connector. Connector & terminal Model without VDC <i>(B301) No. 23 — (i10) No. 19:</i> Model with VDC <i>(B310) No. 36 — (i10) No. 19:</i>	Is the resistance less than 10 Ω ?	Model without VDC: Check the ABSCM. <Ref. to ABS(diag)-2, Basic Diagnostic Procedure.> Model with VDC: Check the VDCCM. <Ref. to VDC(diag)-2, Basic Diagnostic Procedure.>	Repair the wiring harness.

Combination Meter System

INSTRUMENTATION/DRIVER INFO

6. CHECK ENGINE CONTROL MODULE

Step	Check	Yes	No
<p>1</p> <p>CHECK ECM SIGNAL.</p> <p>1) Start the engine.</p> <p>2) Measure the voltage between ECM connector and chassis ground.</p> <p>Connector & terminal (B134) No. 23 (+) — Chassis ground (-):</p>	<p>Is the voltage more than 0 ←→ 14 V?</p>	<p>Go to step 2.</p>	<p>Check the ECM. <Ref. to EN(H4SO)(diag)-2, Basic Diagnostic Procedure.> <Ref. to EN(H4SO U5)(diag)-2, Basic Diagnostic Procedure.> <Ref. to EN(H4DOTC)(diag)-2, Basic Diagnostic Procedure.> <Ref. to EN(H6DO)(diag)-2, Basic Diagnostic Procedure.></p>
<p>2</p> <p>CHECK HARNESS BETWEEN COMBINATION METER AND ECM.</p> <p>1) Turn the ignition switch to OFF.</p> <p>2) Disconnect the connector from ECM and combination meter.</p> <p>3) Measure the resistance between ECM harness connector and combination meter harness connector.</p> <p>Connector & terminal (B134) No. 23 — (i10) No. 20:</p>	<p>Is the resistance less than 10 Ω?</p>	<p>Replace the meter case assembly.</p>	<p>Repair the wiring harness.</p>

Combination Meter System

INSTRUMENTATION/DRIVER INFO

7. CHECK FUEL LEVEL SENSOR.

Step	Check	Yes	No
1 CHECK COMMUNICATION ERROR DISPLAY. 1) Set the ignition switch to ON. 2) Check that the error code is displayed in odo/trip meter.	Is the error code "Er xx" displayed in odo/trip meter?	Check the communication circuit. <Ref. to IDI-11, COMMUNICATION ERROR DISPLAY, INSPECTION, Combination Meter System.>	Go to step 2.
2 CHECK FUEL LEVEL SENSOR. 1) Remove the fuel level sensor. <Ref. to FU(H4SO)-51, REMOVAL, Fuel Level Sensor.> <Ref. to FU(H4SO U5)-60, REMOVAL, Fuel Level Sensor.> <Ref. to FU(H4DOTC)-56, REMOVAL, Fuel Level Sensor.> <Ref. to FU(H6DO)-51, REMOVAL, Fuel Level Sensor.> 2) Measure the resistance between fuel level sensor terminals when the float is in FULL or EMPTY position. Terminals No. 1 — No. 4:	Is the resistance 1.0 — 3.0 Ω (FULL) or 31 — 33 Ω (EMPTY)?	Go to step 3.	Replace the fuel level sensor.
3 CHECK FUEL SUB LEVEL SENSOR. 1) Remove the fuel sub level sensor. <Ref. to FU(H4SO)-52, REMOVAL, Fuel Sub Level Sensor.> <Ref. to FU(H4SO U5)-61, REMOVAL, Fuel Sub Level Sensor.> <Ref. to FU(H4DOTC)-57, REMOVAL, Fuel Sub Level Sensor.> <Ref. to FU(H6DO)-52, REMOVAL, Fuel Sub Level Sensor.> 2) Measure the resistance between fuel sub level sensor terminals when the float is in FULL or EMPTY position. Terminals No. 1 — No. 2:	Is the resistance 1.0 — 3.0 Ω (FULL) or 61 — 63 Ω (EMPTY)?	Go to step 4.	Replace the fuel sub level sensor.
4 CHECK HARNESS BETWEEN FUEL SUB-LEVEL SENSOR AND BODY INTEGRATED UNIT. 1) Disconnect the connector from body integrated unit. 2) Measure the resistance between fuel sub level sensor harness connector terminal and body integrated unit harness connector terminal. Connector & terminal (R59) No. 1 — (B281) No. 19:	Is the resistance less than 10 Ω?	Go to step 5.	Repair the wiring harness.
5 CHECK HARNESS BETWEEN FUEL LEVEL SENSOR AND FUEL SUB LEVEL SENSOR. Measure the resistance between fuel level sensor harness connector terminal and fuel sub level sensor harness connector terminal. Connector & terminal (R58) No. 1 — (R59) No. 2:	Is the resistance less than 10 Ω?	Go to step 6.	Repair the wiring harness.

Combination Meter System

INSTRUMENTATION/DRIVER INFO

Step	Check	Yes	No
6 CHECK FUEL LEVEL SENSOR GROUND CIRCUIT. Measure the resistance between fuel level sensor harness connector terminal and chassis ground. <i>Connector & terminal (R58) No. 4 — Chassis ground:</i>	Is the resistance less than 10 Ω ?	Replace the meter case assembly.	Repair the wiring harness.

8. CHECK ENGINE COOLANT TEMPERATURE SENSOR.

Step	Check	Yes	No
1 CHECK COMMUNICATION ERROR DISPLAY. 1) Set the ignition switch to ON. 2) Check that the error code is displayed in odo/trip meter.	Is the error code "Er xx" displayed in odo/trip meter?	Check the communication circuit. <Ref. to IDI-11, COMMUNICATION ERROR DISPLAY, INSPECTION, Combination Meter System.>	Go to step 2.
2 CHECK ENGINE COOLANT TEMPERATURE SENSOR. Check the engine coolant temperature sensor. <Ref. to EN(H4SO)(diag)-2, Basic Diagnostic Procedure.> <Ref. to EN(H4SO U5)(diag)-2, Basic Diagnostic Procedure.> <Ref. to EN(H4DOTC)(diag)-2, Basic Diagnostic Procedure.> <Ref. to EN(H6DO)(diag)-2, Basic Diagnostic Procedure.>	Is the engine coolant temperature sensor OK?	Replace the meter case assembly.	Replace the engine coolant temperature sensor.

9. COMMUNICATION ERROR DISPLAY

When the following error code is displayed in the odometer/trip meter, inspect the communication circuit since the communication malfunction is generated between each control module. <Ref. to LAN(diag)-2, Basic Diagnostic Procedure.>

Error code	Remarks
------------	---------

Er IU	Malfunction in integrated unit
Er —	Simultaneous malfunction of high/low speed CAN communication
Er HC	Malfunction of high-speed CAN communication
Er LC	Malfunction of low-speed CAN communication
Er EG	EGI Communication malfunction
Er TC	TCM Communication malfunction
Er Ab	ABSCM/VDCCM Communication malfunction
Er SP	ABSCM/VDCCM DTC information, vehicle speed pulse malfunction
Er SS	Wheel speed data malfunction

10.DTC DISPLAY MODE

When DTC display mode is operated, {ECM}, {TCM}, {ABSCM/VDCCM} is displayed repeatedly in this order by pressing the odometer/trip meter button. DTC is displayed in the following table according to type of control module, receiving DTC, DTC detected, No DTC. If CAN communication is broken down, “-----” is displayed.

Control module	Condition	Display
ECM	Receiving DTC	Trip “A” + “P (blinking)”
	DTC detected	Trip “A” + “Pxxxx”
	No DTC	Trip “A” + “P----”
TCM	Receiving DTC	Trip “B” + “P (blinking)”
	DTC detected	Trip “B” + “Pxxxx”
	No DTC	Trip “B” + “P----”
ABSCM/VDCCM	Receiving DTC	Trip “A” + “C (blinking)”
	DTC detected	Trip “A” + “Cxxxx”
	No DTC	Trip “A” + “C----”
When CAN communication is broken down.	—	“-----”

3. Clock System

A: WIRING DIAGRAM

1. CLOCK

<Ref. to WI-175, WIRING DIAGRAM, Clock System.>

B: INSPECTION

1. SYMPTOM CHART

Symptom	Repair order	Reference
No display is shown.	(1) Power supply (2) Clock body	<Ref. to IDI-13, CHECK POWER SUPPLY AND GROUND CIRCUIT, INSPECTION, Clock System.>
Illumination does not illuminate.	(1) Illumination power supply (2) Clock body	<Ref. to IDI-13, CHECK ILLUMINATION CIRCUIT, INSPECTION, Clock System.>
Brightness does not change even when bright switch is pressed.	(1) Bright switch (2) Clock body	<Ref. to IDI-13, CHECK BRIGHT CIRCUIT, INSPECTION, Clock System.>
"Acc" or "ign" is displayed.	ACC or ignition power supply	<Ref. to IDI-14, CHECK ACC OR IGNITION POWER SUPPLY, INSPECTION, Clock System.>
"Err" is displayed in all items.	(1) Communication circuit between combination meter and clock (2) Clock body	<Ref. to IDI-14, CHECK COMMUNICATION CIRCUIT, INSPECTION, Clock System.>
"Err" is displayed when a specified item is selected.	Communication circuit between combination meter and each control module	<Ref. to IDI-11, COMMUNICATION ERROR DISPLAY, INSPECTION, Combination Meter System.>

2. CHECK POWER SUPPLY AND GROUND CIRCUIT

Step	Check	Yes	No
1 CHECK CLOCK POWER SUPPLY. 1) Disconnect the clock harness connector. 2) Measure the voltage between clock harness connector and chassis ground. Connector & terminal <i>(i59) No. 10 (+) — Chassis ground (-):</i>	Is the voltage more than 10 V?	Go to step 2.	Check the harness for open or short between fuse and clock.
2 CHECK CLOCK GROUND CIRCUIT. 1) Turn the ignition switch to OFF. 2) Measure the resistance between clock harness connector and chassis ground. Connector & terminal <i>(i59) No. 6 — Chassis ground:</i>	Is the resistance less than 10 Ω ?	Replace the clock body.	Repair the wiring harness.

3. CHECK ILLUMINATION CIRCUIT

Step	Check	Yes	No
1 CHECK ILLUMINATION CIRCUIT POWER SUPPLY. 1) Turn the ignition switch to OFF. 2) Disconnect the clock harness connector. 3) Turn the ignition switch and lighting switch to ON. 4) Measure the voltage between clock harness connector and chassis ground. Connector & terminal <i>(i59) No. 1 (+) — Chassis ground (-):</i>	Is the voltage more than 10 V?	Replace the clock body.	Check the harness for open or short between fuse and clock.

4. CHECK BRIGHT CIRCUIT

Step	Check	Yes	No
1 CHECK BRIGHT CIRCUIT POWER SUPPLY. 1) Turn the ignition switch to OFF. 2) Disconnect the clock harness connector. 3) Turn the ignition switch to ON. 4) Measure the voltage between clock harness connector and chassis ground. Connector & terminal <i>(i59) No. 2 (+) — Chassis ground (-):</i>	Is the voltage more than 10 V?	Replace the clock body.	Go to step 2.
2 CHECK HARNESS BETWEEN CLOCK AND BODY INTEGRATED UNIT. 1) Turn the ignition switch to OFF. 2) Disconnect harness connector of body integrated unit. 3) Measure the resistance between clock harness connector and body integrated unit harness connector. Connector & terminal <i>(i59) No. 2 — (i84) No. 30:</i>	Is the resistance less than 10 Ω ?	Replace the body integrated unit.	Repair the wiring harness.

Clock System

INSTRUMENTATION/DRIVER INFO

5. CHECK ACC OR IGNITION POWER SUPPLY

Step	Check	Yes	No
1 CHECK ACC POWER SUPPLY. 1) Turn the ignition switch to OFF. 2) Disconnect the clock harness connector. 3) Turn the ignition switch to ACC. 4) Measure the voltage between clock harness connector and chassis ground. Connector & terminal <i>(i59) No. 9 (+) — Chassis ground (-):</i>	Is the voltage more than 10 V?	Go to step 2.	Check the open circuit in harness between fuse and clock.
2 CHECK THE IGNITION POWER SUPPLY. 1) Turn the ignition switch to ON. 2) Measure the voltage between clock harness connector and chassis ground. Connector & terminal <i>(i59) No. 8 (+) — Chassis ground (-):</i>	Is the voltage more than 10 V?	Replace the clock body.	Check the open circuit in harness between fuse and clock.

6. CHECK COMMUNICATION CIRCUIT

Step	Check	Yes	No
1 CHECK THE HARNESS BETWEEN CLOCK AND COMBINATION METER. 1) Turn the ignition switch to OFF. 2) Disconnect the harness of clock and combination meter. 3) Measure the resistance between harness connectors of clock and combination meter. Connector & terminal <i>(i59) No. 5 — (i10) No. 18:</i>	Is the resistance less than 10 Ω ?	Go to step 2.	Repair the wiring harness.
2 CHECK COMMUNICATION ERROR DISPLAY. 1) Connect all the disconnected connectors. 2) Turn the ignition switch to ON. 3) Check that the error code is displayed in odo/trip meter.	Is the error code "Er xx" displayed in odo/trip meter?	Check the communication circuit. <Ref. to IDI-11, COMMUNICATION ERROR DISPLAY, INSPECTION, Combination Meter System.>	Replace the clock body.

4. Combination Meter

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Set the tilt steering at the lowest position.
- 3) Remove the instrument panel lower cover. <Ref. to EI-50, REMOVAL, Instrument Panel Lower Cover.>
- 4) Remove the screws of combination meter (one for upper side, two for lower side) and pull tilting the meter toward you.

- 5) Disconnect the connector in the rear side of combination meter to remove meter.

CAUTION:

- Be careful not to damage the meter or instrument panel.
- Pay particular attention to avoid damaging the meter glass.

B: INSTALLATION

Install in the reverse order of removal.

CAUTION:

- Make sure the electrical connector is connected securely.
- Make sure that each meter operates normally.
- When the combination meter of model with immobilizer has been replaced, be sure to perform the registration procedure of immobilizer.

Combination Meter

INSTRUMENTATION/DRIVER INFO

C: DISASSEMBLY

CAUTION:

- Use gloves to avoid damage and getting fingerprints on the glass surface and meter surfaces.
- Be careful not to apply excessive force to the trip knob.
- Be sure not to touch the meter indicator needle.

Remove the pawl (A), and then detach the meter glass assembly (B) and meter panel assembly (C) from meter case assembly (D).

1. BULB REPLACEMENT

LEDs are used for all of warning lights and indicator lights of combination meters, replace the meter case assembly if faulty.

D: ASSEMBLY

Assemble in the reverse order of disassembly.

5. Speedometer

A: SPECIFICATION

Since the meter case assembly cannot be disassembled, do not remove or inspect the speedometer alone. (Do not remove the cover on the back side.)

6. Tachometer

A: SPECIFICATION

Since the meter case assembly cannot be disassembled, do not remove or inspect the tachometer alone. (Do not remove the cover on the back side.)

7. Fuel Gauge

A: SPECIFICATION

Since the meter case assembly cannot be disassembled, do not remove or inspect the fuel gauge alone. (Do not remove the cover on the back side.)

8. Water Temperature Gauge

A: SPECIFICATION

Since the meter case assembly cannot be disassembled, do not remove or inspect the water temperature gauge alone. (Do not remove the cover on the back side.)

9. Clock

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Remove the center air vent grille. <Ref. to AC-46, REMOVAL, Air Vent Grille.>
- 3) Loosen the screws, and then remove the clock (B) from center air vent grille (A).

B: INSTALLATION

Install in the reverse order of removal.

General Description

SEATS

B: CAUTION

- Be sure to perform the system calibration for occupant detection system after seat installation, when the passenger seat has been removed or even one installing bolt for front passenger seat has been loosened. <Ref. to OD(diag)-12, SYSTEM CALIBRATION, OPERATION, Subaru Select Monitor.> Failure to do so may cause improper activation of passenger's airbag.
- Never disassemble the seat cushion frame assembly and slide rail, remove the occupant detection control module and each load cell sensor, or disconnect the harness connector, since the occupant detection control module, each load cell sensor and harness of occupant detection system (passenger's seat only) are installed as seat frame assembly.
- When removing the front seat from a vehicle equipped with side airbag, follow cautions given in the airbag section. <Ref. to AB-5, CAUTION, General Description.>

C: PREPARATION TOOL

1. GENERAL TOOL

TOOL NAME	REMARKS
Long nose pliers	Used for removing the hog ring.
Hog ring pliers	Used for installing the hog ring.
TORX® T50	Used for removing and installing the inner seat belt.

2. Front Seat

A: REMOVAL

CAUTION:

The airbag system is fitted with a backup power source. After disconnecting the battery ground cable, the airbag may deploy if you do not wait for 20 seconds before starting the repair of airbag system.

1. DRIVER'S SEAT

- 1) Remove the headrest.
- 2) Tilt the backrest forward, and move the seat forward.
- 3) Remove the rear bolt cover, and remove the two bolts at the rear side of slide rail.
- 4) Move the seat backward, and remove the two bolts at the front side of slide rail.
- 5) Disconnect the ground cable from battery, and wait for more than 20 seconds before starting work.
- 6) Disconnect the connector under the seat.
 - Seat belt buckle switch connector
 - Seat position sensor connector
 - Side airbag connector
 - Seat heater connector (Model with seat heater)
 - Power seat connector (Model with power seat)

- 7) Remove the seat from vehicle.

2. PASSENGER'S SEAT

CAUTION:

• Be sure to perform the system calibration for occupant detection system after seat installation, when the passenger seat has been removed or even one installing bolt for front passenger seat has been loosened. <Ref. to OD(diag)-12, SYSTEM CALIBRATION, OPERATION, Subaru Select Monitor.> Failure to do so may cause improper activation of passenger's airbag.

• Never disassemble the seat cushion frame assembly and slide rail, remove the occupant detection control module and each load cell sensor, or disconnect the harness connector, since the occupant detection control module, each load cell sensor and harness of occupant detection system (passenger's seat only) are installed as seat frame assembly.

• If performing the removal of backrest, read the data of load cell sensor using Subaru Select Monitor before removing seat. <Ref. to OD(diag)-12, SENSOR DATA OUTPUT, OPERATION, Subaru Select Monitor.>

- 1) Remove the headrest.
- 2) Tilt forward the backrest, and move the seat forward.
- 3) Remove the rear bolt cover, and remove the bolt at the rear side of slide rail.
- 4) Move the seat backward, remove the front bolt cover, and then remove the bolt at the front side of slide rail.
- 5) Remove the battery ground cable, and wait for more than 20 seconds before starting work.
- 6) Disconnect the all connector of connector holder in the seat cushion backside.

- Coupling connector of occupant detection control module
 - Side airbag connector
 - Seat harness connector
 - Power seat connector (Model with power seat)
 - Seat heater connector (Model with seat heater)
- 7) Remove the seatbelt anchor cover.

NOTE:

It is easy to work with the whole seat tilted backward.

Front Seat

SEATS

- Manual seat

(A) Claw

- Power seat

(A) Claw

8) Loosen the TORX® bolt to remove seatbelt anchor.

9) Remove the seat from vehicle.

B: INSTALLATION

Install in the reverse order of removal.

NOTE:

Tighten the slide rail installing bolt gradually in several steps to the specified torque in the order as shown in the figure.

CAUTION:

Be sure to perform the system calibration for occupant detection system after passenger's seat installation. <Ref. to OD(diag)-12, SYSTEM CALIBRATION, OPERATION, Subaru Select Monitor.> Failure to do so may cause improper activation of passenger's airbag.

Tightening torque:

Refer to "COMPONENT" of "General Description". <Ref. to SE-2, COMPONENT, General Description.>

C: DISASSEMBLY

1. DRIVER'S SEAT

- MANUAL SEAT

1) Remove the seat from vehicle. <Ref. to SE-9, REMOVAL, Front Seat.>

2) Remove the seat lifter cover using a flat tip screwdriver and loosen the inner bolt to remove seat lifter lever.

3) Remove the hook (A) and detach reclining lever cover.

4) Remove the screws (A) and clips (B), and then detach the seat side cover outside.

5) Loosen the screws to detach seat side cover inside.

6) Remove the TORX® bolt, and then remove the inner seat belt assembly.

7) Remove the two bolts from reclining hinge on each side.

8) Remove the clips and hooks, and then detach the backrest back cover.

9) Remove the lock clip, and then remove the lumbar support lever.

Front Seat

SEATS

10) Remove the hooks at the rear side of backrest.

11) Remove the hog rings (A) in the side airbag module installation side.

12) Remove the cover frame (A).

13) Remove the headrest lock bushing.

NOTE:

Push outside to remove it from the inside of seat.

14) Pull out the backrest frame assembly.

15) Remove the hog rings (A) on the front side of backrest, and then remove the backrest cover from backrest.

16) Remove the hooks (A), and then remove the seat cushion frame assembly.

17) Remove the hog rings (A), and then remove the seat cushion cover from seat cushion pad.

18) Remove the bolt of sliding adjustment bar and connecting wire.

19) Remove the bolts, and then remove the slide rail.

20) Remove the hooks and hog rings at the bottom of headrest, and then remove the headrest cover from headrest.

• POWER SEAT

1) Remove the seat from vehicle. <Ref. to SE-9, REMOVAL, Front Seat.>
2) Remove the seat switch knob.

3) Disconnect the connector of reclining motor from the back of seat cushion.

4) Remove the screw (A) and clips (B), and then disconnect the seat switch connector to remove seat side cover outside.

5) Remove the screw (A) and clip (B), and then remove the seat side cover inside.

6) Remove the TORX® bolt, and then remove the inner seat belt assembly.

Front Seat

SEATS

7) Remove the two bolts from the reclining hinge on each left and right side.

8) Remove the clips and hooks, and then detach the backrest back cover.

9) Remove the lock clip, and then remove the lumbar support lever.

10) Remove the hooks at the rear side of backrest.

11) Remove the hog rings (A) in the side airbag module installation side.

12) Remove the cover frame (A).

13) Remove the headrest lock bushing.

NOTE:

Push outside to remove it from the inside of seat.

14) Pull out the backrest frame assembly.

15) Remove the two bolts on each left and right side, and then remove the reclining motor assembly.

16) Remove the hog rings (A) on the front side of backrest, and then remove the backrest cover from backrest.

17) Remove the clip (A) and straps (B) on the back of seat cushion.

18) Remove the bolt (A) and hook (B) on left and right side, and then remove the seat cushion frame from seat rail assembly.

19) Remove the hooks (A), and then remove the seat cushion from seat cushion frame.

20) Remove the hog rings (A), and then remove the seat cushion cover from seat cushion pad.

21) Remove the hooks and hog rings at the bottom of headrest, and then remove the headrest cover from headrest.

2. PASSENGER'S SEAT

• MANUAL SEAT

CAUTION:

- Never disassemble the seat cushion frame assembly and slide rail, remove the occupant detection control module and each load cell sensor, or disconnect the harness connector, since the occupant detection control module, each load cell sensor and harness of occupant detection system (passenger's seat only) are installed as seat frame assembly.

Front Seat

SEATS

• If performing the removal of backrest, read the data of load cell sensor using Subaru Select Monitor before removing seat. <Ref. to OD(diag)-12, SENSOR DATA OUTPUT, OPERATION, Subaru Select Monitor.>

- 1) Remove the seat from vehicle.
- 2) Remove the reclining lever cover.

- 3) Remove the screw (A), clip (B) and claw (C), and then remove the seat side cover outside.

- 4) Remove the screw (A) and claw (B), and remove the seat side cover inside.

- 5) Remove the TORX® bolt to remove inner seat belt assembly.

- 6) Remove the two reclining hinge bolts from each RH and LR side.

- 7) Remove the seat cushion pad and cover from seat cushion frame assembly.

CAUTION:

Never disassemble the seat cushion frame assembly and slide rail, remove the occupant detection control module and each load cell sensor, or disconnect the harness connector, since the occupant detection control module, each load cell sensor and harness of occupant detection system (passenger's seat only) are installed as seat frame assembly.

8) Remove the hog rings (A), and then remove the seat cushion cover from seat cushion pad.

9) Refer to "DRIVER'S SEAT" for disassembly procedure of backrest and headrest.

• **POWER SEAT**

CAUTION:

• Never disassemble the seat cushion frame assembly and slide rail, remove the occupant detection control module and each load cell sensor, or disconnect the harness connector, since the occupant detection control module, each load cell sensor and harness of occupant detection system (passenger's seat only) are installed as seat frame assembly.

• If performing the removal of backrest, read the data of load cell sensor using Subaru Select Monitor before removing seat. <Ref. to OD(diag)-12, SENSOR DATA OUTPUT, OPERATION, Subaru Select Monitor.>

- 1) Remove the seat from vehicle.
- 2) Remove the screw (A), clip (B) and claw (C), disconnect the connector of power seat switch, and then remove the seat side cover outside.

3) Loosen the screw to remove seat side cover inside.

4) Remove the TORX® bolt to remove inner seat belt assembly.

5) Remove the two reclining hinge bolts from each RH and LH side.

6) Remove the seat cushion pad and cover from seat cushion frame assembly.

Front Seat

SEATS

CAUTION:

Never disassemble the seat cushion frame assembly and slide rail, remove the occupant detection control module and each load cell sensor, or disconnect the harness connector, since the occupant detection control module, each load cell sensor and harness of occupant detection system (passenger's seat only) are installed as seat frame assembly.

7) Remove the hog rings (A), and then remove the seat cushion cover from seat cushion pad.

8) Refer to "DRIVER'S SEAT" for disassembly procedure of backrest and headrest.

D: ASSEMBLY

CAUTION:

When the backrest cover is not installed securely, the side airbag module may not be deployed properly, therefore keep strictly to the following procedure.

- Be careful not to stain or damage the backrest cover during assembly.
- Always use new hog rings.
- Secure the hog ring using hog ring pliers.
- Install the hog rings to the specified points securely and make sure that no wrinkle or twisting on the backrest cover.

1. DRIVER'S SEAT

Assemble in the reverse order of disassembly.

NOTE:

- Install the inner seat belt in the procedure described in "Front Seat Belt". <Ref. to SB-11, INNER SEAT BELT ASSEMBLY, INSTALLATION, Front Seat Belt.>
- Install the backrest assembly and seat cushion assembly in the following procedure.

1) Temporarily tighten the four reclining hinge bolts.

2) Place the backrest in the most upright position. (For manual seat, ensure the reclining mechanism locked securely.)

3) Tighten the reclining hinge bolts (1) — (4) in two or three steps by gradually increasing the torque until they reach the specified torque.

(A) Vehicle inside

(B) Vehicle outside

2. PASSENGER'S SEAT

Assemble in the reverse order of disassembly.

1) Assemble the seat cushion in the reverse order of disassembly.

2) Assemble the backrest in the reverse order of disassembly.

3) When assembling the backrest assembly to seat cushion assembly, fill the gap in the front side of slide rail LH and the back side of slide rail RH with cloth in order to make the seat cushion assembly stable.

4) Temporarily tighten the reclining hinge bolt in the order of (1) — (4) but not to secure the seat back assembly.

(A) Vehicle inside

(B) Vehicle outside

5) Operate the reclining lever to place the backrest in the most upright position, and check the first lock of recliner.

6) Hold the seat cushion assembly securely, tighten the reclining hinge bolt to the specified torque in the order above.

CAUTION:

Do not touch the backrest assembly when tightening the reclining hinge bolt.

7) Assemble each harnesses, inner belt assembly and each covers in the reverse order of removal.

Tightening torque:

Refer to “COMPONENT” of “General Description”. <Ref. to SE-2, COMPONENT, General Description.>

E: INSPECTION

Check that no tear or fray on the backrest cover and seat cushion cover.

NOTE:

When the door side of backrest cover is torn or frayed, the side airbag may not be deployed properly. Replace it with new one in such a case.

3. Rear Seat

A: REMOVAL

1. SEDAN MODEL

1) Remove the two hooks while lifting up the rear seat cushion.

2) Remove the hook (A) by pushing it backward while lifting up the front side of seat cushion to detach seat cushion.

3) Remove the lower anchor bolt of rear center seat belt.

4) Remove the bolts which secure the bottom of backrest.

5) Remove the anchor part on backrest side from the hook on body side (A) while lifting up the backrest to detach it from vehicle.

2. WAGON MODEL

1) Disconnect the ground cable from battery.
2) Remove the two hooks while lifting up the rear seat cushion.

3) Remove the hook (A) by pushing it backward while lifting up the front side of seat cushion to detach seat cushion.

4) Remove the headrest, and then tilt the backrest forward.

5) Remove the luggage floor box. <Ref. to EI-73, REMOVAL, Luggage Floor Box.>

6) Remove the hinge assembly center bolts.

7) Remove the backrest from hinge assembly LH (hinge assembly RH).

NOTE:

The backrest cannot be detached when the hinge assembly side does not mate with the backrest pin position.

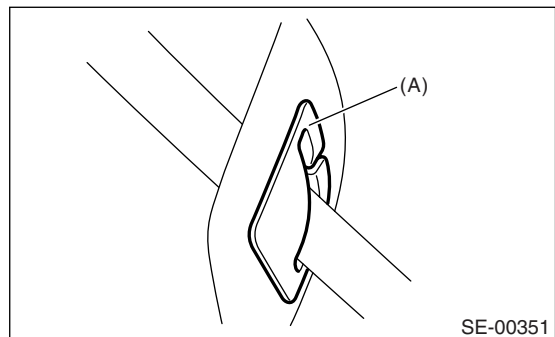

8) Remove the lower anchor bolt (A) of outer seat belt and backrest shoulder bolt (B).

9) Remove the backrest shoulder with lifting it up.

10) Remove the belt cover (A) from backrest shoulder cover, and then pull out the seat belt.

Rear Seat

SEATS

B: INSTALLATION

1. SEDAN MODEL

Install in the reverse order of removal.

NOTE:

- After installing the backrest, make sure that each seat belt operates normally.
- Make sure that they are secured on each hook of vehicle side.

Tightening torque:

Refer to “COMPONENT” of “General Description”. <Ref. to SE-6, REAR SEAT (SEDAN MODEL), COMPONENT, General Description.>

2. WAGON MODEL

Install in the reverse order of removal.

NOTE:

- After installing the backrest, make sure that each seat belt operates normally.
- Make sure that they are secured on each hook of vehicle side.

Tightening torque:

Refer to “COMPONENT” of “General Description”. <Ref. to SE-7, REAR SEAT (WAGON MODEL), COMPONENT, General Description.>

C: DISASSEMBLY

1. SEDAN MODEL

- 1) Remove the rear seat. <Ref. to SE-20, SEDAN MODEL, REMOVAL, Rear Seat.>
- 2) Remove the headrest.
- 3) Remove the nuts, and then detach the trunk through assembly.

- 4) Remove the hog rings (A) on the rear side of backrest.

- 5) Remove the hog rings (A) on the front side of backrest.

- 6) Remove both sides of armrest hinge covers, and loosen the screws to remove armrest.

- 7) Remove the hook, and then detach the center through cover.

8) Remove the hook, and then remove the armrest cover.

9) Remove the hook and hog ring, and then remove the headrest cover.

10) Remove the hog rings (A) on the rear side of seat cushion.

11) Remove the hog rings (A), and then remove the seat cushion cover.

2. WAGON MODEL

1) Remove the rear seat. <Ref. to SE-20, WAGON MODEL, REMOVAL, Rear Seat.>

2) Remove the hooks at the bottom of backrest assembly LH, and then turn over the backrest cover to remove the hog rings (A) and hooks (B).

3) Remove the hog rings (A) on the front side of backrest, and then remove the backrest cover.

4) Remove the bolts, and then remove the backrest latch.

5) Loosen the screws to remove the armrest from backrest assembly RH.

Rear Seat

SEATS

NOTE:

Armrest cannot be removed when backrest assembly RH side does not mate with armrest side pin position.

6) After this operation, refer to the step 2) to disassemble backrest assembly RH.

7) Remove the hook, and then remove the armrest cover.

8) Remove the hook and hog ring, and then remove the headrest cover.

9) Remove the hog rings (A) on the rear side of seat cushion.

10) Remove the hog rings (A), and then remove the seat cushion cover.

D: ASSEMBLY

Assemble in the reverse order of disassembly.

NOTE:

- Do not contaminate or damage the cover.
- While installing the hog rings, prevent the seat from getting wrinkled.

CAUTION:

- Always use new hog rings.
- Secure the hog ring using hog ring pliers.
- Install the hog rings to the specified points securely and be sure to prevent backrest cover from wrinkle or twisting.

E: INSPECTION

Check that no tear or fray on the seat cover.

4. Seat Heater System

A: REMOVAL

1. SEAT HEATER UNIT

- 1) Remove the front seats. <Ref. to SE-9, REMOVAL, Front Seat.>
- 2) Remove the backrest cover and seat cushion cover of front seat. <Ref. to SE-10, DISASSEMBLY, Front Seat.>
- 3) Remove the hog ring, and then remove the seat heater unit.

2. SEAT HEATER SWITCH

- 1) Remove the console box. <Ref. to EI-53, REMOVAL, Console Box.>
- 2) Remove the seat heater switch from console box.

B: INSTALLATION

Install in the reverse order of removal.

C: INSPECTION

1. WIRING DIAGRAM

<Ref. to WI-138, WIRING DIAGRAM, Power Seat System.>

2. SEAT HEATER UNIT

Disconnect the seat heater unit connector, and check the continuity between terminals of connector.

Connector & terminal

No. 1 — No. 3:

No. 1 — No. 4:

No. 3 — No. 4:

If no continuity exists, replace the seat heater unit with a new part.

3. SEAT HEATER SWITCH

• CHECK THERMISTOR OUTPUT VOLTAGE

- 1) Connect the battery to the connector.
Connector terminals No. 12 (+):
- 2) Measure the voltage between connector and chassis ground.

Connector & terminal:

LHD side seat

(C2) No. 8 (+) — Chassis ground (-):

RHD side seat

(C2) No. 6 (+) — Chassis ground (-):

If voltage is not 1.5 V or more, replace the seat heater switch.

• CHECK SWITCH OUTPUT VOLTAGE

- 1) Connect the battery to the connector.
Connector terminals No. 12 (+):
- 2) Measure the voltage between connector and chassis ground when turning the switch to other than OFF position.

Connector & terminal:

LHD side seat

(C2) No. 11 (+) — Chassis ground (-):

RHD side seat

(C2) No. 7 (+) — Chassis ground (-):

Seat Heater System

SEATS

If voltage does not change from 10 V or more to zero, replace the seat heater switch.

General Description

SECURITY AND LOCKS

B: CAUTION

- Before disassembling or reassembling parts, always disconnect the battery ground cable. When repairing the audio, control module, etc. which are provided with memory functions, record the memory contents before disconnecting the ground cable from battery. Otherwise, these contents are erased upon disconnection.
- Reassemble the parts in the reverse order of disassembly unless otherwise indicated.
- Adjust the parts to the specifications described in this manual if so designated.

- Connect the connectors securely during reassembly.
- After reassembly, ensure the functional parts operate smoothly.
- The air bag system wiring harness is routed near electrical parts and switches.
- Air bag system wiring harnesses and connectors are yellow. Do not use the electrical test equipment on these circuits.
- Be careful not to damage the airbag system wiring harness when servicing the ignition key cylinder.

C: PREPARATION TOOL

1. SPECIAL TOOL

ILLUSTRATION	TOOL NUMBER	DESCRIPTION	REMARKS
 ST-925580000	925580000	PULLER	Used for removing trim clip.

2. GENERAL TOOL

TOOL NAME	REMARKS
Circuit tester	Used for measuring resistance and voltage.
Drill	Used for replacing ignition key lock.
Clip remover	Used for removal of trim.
Clip clamp pliers	Used for removal of various clips and clamps.

2. Door Lock Control System

A: WIRING DIAGRAM

1. DOOR LOCK CONTROL

<Ref. to WI-182, WIRING DIAGRAM, Keyless Entry System.>

B: INSPECTION

1. SYMPTOM CHART

Symptom	Repair order	Reference
The door lock control system does not operate.	1. Check the fuse.	<Ref. to SL-7, CHECK FUSE, INSPECTION, Door Lock Control System.>
	2. Check the power supply and ground circuit for body integrated unit.	<Ref. to SL-8, CHECK POWER SUPPLY AND GROUND CIRCUIT, INSPECTION, Door Lock Control System.>
	3. Check the door lock switch and circuit.	<Ref. to SL-8, CHECK DOOR LOCK SWITCH, INSPECTION, Door Lock Control System.>
	4. Check the door lock actuator and circuit.	<Ref. to SL-9, CHECK DOOR LOCK ACTUATOR AND CIRCUIT, INSPECTION, Door Lock Control System.>
The door lock switch does not operate.	Check the door lock switch.	<Ref. to SL-8, CHECK DOOR LOCK SWITCH, INSPECTION, Door Lock Control System.>
A specific door lock actuator does not operate.	Check the door lock actuator and circuit.	<Ref. to SL-9, CHECK DOOR LOCK ACTUATOR AND CIRCUIT, INSPECTION, Door Lock Control System.>

2. CHECK FUSE

Step	Check	Yes	No
1 CHECK FUSE. Remove and visually check the fuse No. 3 (in the fuse and relay box) and No. 7 (in the fuse and relay box).	Is the fuse blown out?	Replace the fuse with a new one.	Check the power supply and ground circuit. <Ref. to SL-8, CHECK POWER SUPPLY AND GROUND CIRCUIT, INSPECTION, Door Lock Control System.>

Door Lock Control System

SECURITY AND LOCKS

3. CHECK POWER SUPPLY AND GROUND CIRCUIT

Step	Check	Yes	No
1 CHECK POWER SUPPLY. 1) Disconnect the harness connector of body integrated unit. 2) Measure the voltage between harness connector terminal and chassis ground. Connector & terminal <i>(i84) No. 34 (+) — Chassis ground (-):</i> <i>(B281) No. 2 (+) — Chassis ground (-):</i>	Is the voltage more than 10 V?	Go to step 2.	Check the harness for open or short circuit between body integrated unit and fuse.
2 CHECK GROUND CIRCUIT. Measure the resistance between harness connector terminal and chassis ground. Connector & terminal <i>(B280) No. 22 — Chassis ground:</i> <i>(B281) No. 8, 9 — Chassis ground:</i>	Is the resistance less than 10 Ω ?	The power supply and ground circuit are OK.	Repair the harness.

4. CHECK DOOR LOCK SWITCH

Step	Check	Yes	No
1 CHECK DOOR LOCK SWITCH. Check the input from door lock switch to body integrated unit using Subaru Select Monitor. 1) Connect the Subaru Select Monitor to data link connector. 2) Turn the ignition switch to ON. 3) Select {body integrated unit} from main menu. 4) Select {Current Data Display & Save}. 5) Check the input to body integrated unit by operating the door lock switch.	Is the normal input signal displayed when the door lock switch is moved to LOCK/UNLOCK?	The door lock switch is OK.	Go to step 2.
2 CHECK DOOR LOCK SWITCH CIRCUIT. 1) Disconnect the body integrated unit harness connector. 2) Measure the resistance between the harness connector terminal and chassis ground when moving the door lock switch to LOCK. Connector & terminal <i>(i84) No. 15 — Chassis ground:</i>	Is the resistance less than 10 Ω ?	Go to step 3.	Go to step 4.
3 CHECK DOOR LOCK SWITCH CIRCUIT. Measure the resistance between the harness connector terminal and chassis ground when the door lock switch is moved to UNLOCK. Connector & terminal <i>(i84) No. 29 — Chassis ground:</i>	Is the resistance less than 10 Ω ?	The door lock switch is OK.	Go to step 4.
4 CHECK DOOR LOCK SWITCH. 1) Disconnect the door lock switch harness connector. 2) Measure the resistance between the door lock switch terminals when moving the door lock switch to LOCK. Connector & terminal Driver's side: <i>(D7) No. 4 — No. 7:</i> Passenger's side: <i>(D125) No. 4 — No. 3:</i>	Is the resistance less than 1 Ω ?	Go to step 5.	Replace the door lock switch.

Door Lock Control System

Step	Check	Yes	No
5 CHECK DOOR LOCK SWITCH. Measure the resistance between the door lock switch terminals when moving the door lock switch to UNLOCK. <i>Connector & terminal</i> <i>Driver's side:</i> <i>(D7) No. 5 — No. 7:</i> <i>Passenger's side:</i> <i>(D125) No. 1 — No. 3:</i>	Is the resistance less than 1 Ω ?	Check the harness for open circuits or shorts between the body integrated unit and the door lock switch.	Replace the door lock switch.

5. CHECK DOOR LOCK ACTUATOR AND CIRCUIT

Step	Check	Yes	No
1 CHECK OUTPUT SIGNAL. Measure the voltage between the harness connector terminal and chassis ground of body integrated unit when moving the door lock switch to LOCK. <i>Connector & terminal</i> <i>(i84) No. 7 (+) — Chassis ground (-):</i>	Is the voltage more than 10 V?	Go to step 2.	Replace the body integrated unit. <Ref. to SL-54, Body Integrated Unit.>
2 CHECK OUTPUT SIGNAL. Measure the voltage between the harness connector terminal and chassis ground of body integrated unit when moving the door lock switch to UNLOCK. <i>Connector & terminal</i> <i>Driver's side:</i> <i>(i84) No. 23 (+) — Chassis ground (-):</i> <i>Except for driver's side:</i> <i>(i84) No. 8 (+) — Chassis ground (-):</i>	Is the voltage more than 10 V?	Go to step 3.	Replace the body integrated unit. <Ref. to SL-54, Body Integrated Unit.>
3 CHECK POWER WINDOW MAIN SWITCH OUTPUT SIGNAL. Measure the voltage between the harness connector terminal of power window main switch and chassis ground when moving the door lock switch to LOCK. <i>Connector & terminal</i> <i>(D7) No. 4 (+) — Chassis ground (-):</i>	Is the voltage more than 10 V?	Go to step 4.	Replace the power window main switch. <Ref. to GW-9, Power Window Control Switch.>
4 CHECK POWER WINDOW MAIN SWITCH OUTPUT SIGNAL. Measure the voltage between the harness connector terminal of power window main switch and chassis ground when moving the door lock switch to UNLOCK. <i>Connector & terminal</i> <i>(D7) No. 5 (+) — Chassis ground (-):</i>	Is the voltage more than 10 V?	Go to step 5.	Replace the power window main switch. <Ref. to GW-9, Power Window Control Switch.>
5 CHECK DOOR LOCK ACTUATOR. Check the door lock actuator. <ul style="list-style-type: none"> • Front Door Lock Actuator <Ref. to SL-36, Front Door Lock Actuator.> • Rear Door Lock Actuator <Ref. to SL-40, Rear Door Lock Actuator.> • Rear Gate Latch Lock Actuator <Ref. to SL-42, Rear Gate Latch Assembly.> 	Is the door lock actuator OK?	Check the harness for open or short circuit between body integrated unit and door lock actuator.	Replace the door lock actuator.

1. SYMPTOM CHART

Symptom	Repair order	Reference
None of the functions of keyless entry system operate.	1. Check the transmitter battery.	<Ref. to SL-14, CHECK TRANSMITTER BATTERY AND FUNCTION, INSPECTION, Keyless Entry System.>
	2. Check the fuse.	<Ref. to SL-15, CHECK FUSE, INSPECTION, Keyless Entry System.>
	3. Check the keyless entry control module.	<Ref. to SL-15, CHECK KEYLESS ENTRY CONTROL MODULE, INSPECTION, Keyless Entry System.>
	4. Check the power supply, ground circuit and registration connector circuit for the body integrated unit.	<Ref. to SL-16, CHECK BODY INTEGRATED UNIT POWER SUPPLY, GROUND CIRCUIT AND REGISTERED CONNECTOR CIRCUIT, INSPECTION, Keyless Entry System.>
	5. Check the key warning switch.	<Ref. to SL-18, CHECK KEY WARNING SWITCH, INSPECTION, Keyless Entry System.>
	6. Check the door switch.	<Ref. to SL-17, CHECK DOOR SWITCH, INSPECTION, Keyless Entry System.>
	7. Check the body integrated unit.	<Ref. to LAN(diag)-2, Basic Diagnostic Procedure.>
The transmitter cannot be registered.	1. Check the key warning switch.	<Ref. to SL-18, CHECK KEY WARNING SWITCH, INSPECTION, Keyless Entry System.>
	2. Check the door lock switch signal.	<Ref. to SL-20, CHECK DOOR LOCK SWITCH, INSPECTION, Keyless Entry System.>
	3. Check ignition switch.	<Ref. to SL-23, CHECK IGNITION SWITCH, INSPECTION, Keyless Entry System.>
	4. Check door switch.	<Ref. to SL-17, CHECK DOOR SWITCH, INSPECTION, Keyless Entry System.>
	5. Check the body integrated unit.	<Ref. to LAN(diag)-2, Basic Diagnostic Procedure.>

SECURITY AND LOCKS

Symptom	Repair order	Reference
Door lock or unlock does not operate. NOTE: If the door lock control system does not operate when using the door lock switch, check the door lock control system. <Ref. to SL-7, INSPECTION, Door Lock Control System.>	1. Check the transmitter battery.	<Ref. to SL-14, CHECK TRANSMITTER BATTERY AND FUNCTION, INSPECTION, Keyless Entry System.>
	2. Check the keyless entry control module.	<Ref. to SL-15, CHECK KEYLESS ENTRY CONTROL MODULE, INSPECTION, Keyless Entry System.>
	3. Check the key warning switch.	<Ref. to SL-18, CHECK KEY WARNING SWITCH, INSPECTION, Keyless Entry System.>
	4. Check the door switch.	<Ref. to SL-17, CHECK DOOR SWITCH, INSPECTION, Keyless Entry System.>
	5. Check the body integrated unit.	<Ref. to LAN(diag)-2, Basic Diagnostic Procedure.>
The panic alarm does not operate.	1. Check the transmitter battery and function.	<Ref. to SL-14, CHECK TRANSMITTER BATTERY AND FUNCTION, INSPECTION, Keyless Entry System.>
	2. Check the horn operation.	<Ref. to SL-22, CHECK HORN OPERATION, INSPECTION, Keyless Entry System.>
	3. Check the body integrated unit.	<Ref. to LAN(diag)-2, Basic Diagnostic Procedure.>
Trunk lid unlock does not operate. (Sedan model)	1. Check the transmitter battery.	<Ref. to SL-14, CHECK TRANSMITTER BATTERY AND FUNCTION, INSPECTION, Keyless Entry System.>
	2. Check the keyless entry control module.	<Ref. to SL-15, CHECK KEYLESS ENTRY CONTROL MODULE, INSPECTION, Keyless Entry System.>
	3. Check the key warning switch.	<Ref. to SL-18, CHECK KEY WARNING SWITCH, INSPECTION, Keyless Entry System.>
	4. Check the trunk lid lock actuator.	<Ref. to SL-20, CHECK TRUNK LID LOCK ACTUATOR, INSPECTION, Keyless Entry System.>
	5. Check the body integrated unit.	<Ref. to LAN(diag)-2, Basic Diagnostic Procedure.>
The buzzer chirp and hazard light do not operate.	1. Check the buzzer operation.	<Ref. to SL-22, CHECK KEYLESS BUZZER, INSPECTION, Keyless Entry System.>
	2. Check the hazard light operation.	<Ref. to SL-19, CHECK HAZARD LIGHT OPERATION, INSPECTION, Keyless Entry System.>
	3. Check the body integrated unit.	<Ref. to LAN(diag)-2, Basic Diagnostic Procedure.>
Room light does not operate.	1. Check the room light operation.	<Ref. to SL-19, CHECK ROOM LIGHT OPERATION, INSPECTION, Keyless Entry System.>
	2. Check the body integrated unit.	<Ref. to LAN(diag)-2, Basic Diagnostic Procedure.>

Keyless Entry System

SECURITY AND LOCKS

Symptom	Repair order	Reference
Ignition switch illumination does not operate.	1. Check the ignition switch illumination.	<Ref. to SL-21, CHECK IGNITION SWITCH ILLUMINATION, INSPECTION, Keyless Entry System.>
	2. Check the body integrated unit.	<Ref. to LAN(diag)-2, Basic Diagnostic Procedure.>

2. CHECK TRANSMITTER BATTERY AND FUNCTION

Step	Check	Yes	No
1 CHECK TRANSMITTER BATTERY. 1) Remove the battery from transmitter. <Ref. to SL-55, REMOVAL, Transmitter.> 2) Check the battery voltage. <Ref. to SL-55, INSPECTION, Transmitter.>	Is the voltage more than 2.5 V?	Go to step 2.	Replace the transmitter battery. <Ref. to SL-55, Transmitter.>
2 CHECK TRANSMITTER. Register the transmitter which operates normally on other vehicles to inspection target vehicle. <Ref. to SL-55, REGISTRATION OF TRANSMITTER WITH SUBARU SELECT MONITOR, REPLACEMENT, Transmitter.> 1) Close all the doors and rear gate of inspection target vehicle. 2) Using transmitter, lock and unlock the doors and rear gate of inspection target vehicle.	Is the inspection target vehicle operates lock and unlock normally?	Go to step 3.	Due to vehicle malfunction, continue the keyless entry system diagnosis.
3 CHECK TRANSMITTER. Register the transmitter of inspection target vehicle to another vehicle which operates keyless system normally. <Ref. to SL-55, REGISTRATION OF TRANSMITTER WITH SUBARU SELECT MONITOR, REPLACEMENT, Transmitter.>	Is the transmitter registered correctly?	Go to step 4.	Replace the transmitter. <Ref. to SL-55, REGISTRATION OF TRANSMITTER WITH SUBARU SELECT MONITOR, REPLACEMENT, Transmitter.>
4 CHECK TRANSMITTER. Check the registered transmitter. 1) Close all the doors and rear gate of the vehicle which operates keyless system normally. 2) Using transmitter, lock and unlock the doors and rear gate of vehicle.	Is the vehicle operates lock and unlock normally?	Transmitter is normal.	Replace the transmitter. <Ref. to SL-55, REGISTRATION OF TRANSMITTER WITH SUBARU SELECT MONITOR, REPLACEMENT, Transmitter.>

CAUTION:

Be sure to reset the transmitter, which is registered from other vehicle to inspection target vehicle, and the vehicle, to which is registered transmitter, to the condition of before inspection. (Register the transmitter to original condition.)

3. CHECK FUSE

Step	Check	Yes	No
1 CHECK FUSE. Remove and visually check the fuse No. 3 (in the fuse and relay box) and No. 7 (in the fuse and relay box).	Is the fuse blown out?	Replace the fuse with a new one.	Check the power supply and ground circuit. <Ref. to SL-16, CHECK BODY INTEGRATED UNIT POWER SUPPLY, GROUND CIRCUIT AND REGISTERED CONNECTOR CIRCUIT, INSPECTION, Keyless Entry System.>

4. CHECK KEYLESS ENTRY CONTROL MODULE

Step	Check	Yes	No
1 CHECK DIAGNOSTIC TROUBLE CODE (DTC) 1) Connect the Subaru Select Monitor to data link connector. 2) Turn the ignition switch to ON. 3) Select {Body integrated unit} from main menu. 4) Select the {Diagnostic Trouble Code}. 5) Check that the DTC is displayed.	Is DTC B0500 "Keyless UART com. Malfunction" displayed?	Go to step 2.	Keyless entry control module is normal.
2 CHECK POWER SUPPLY. 1) Disconnect the keyless entry control module harness connector. 2) Measure the voltage between the harness connector terminal and chassis ground. <i>Connector & terminal (i96) No. 4 (+) — Chassis ground (-):</i>	Is the voltage more than 10 V?	Go to step 3.	Check the harness for open circuits and shorts between the keyless entry control module and fuse.
3 CHECK GROUND CIRCUIT. Measure the resistance between the harness connector terminal and chassis ground. <i>Connector & terminal (i96) No. 7 — Chassis ground:</i>	Is the resistance less than 10 Ω?	Go to step 4.	Repair the harness.
4 CHECK KEYLESS ENTRY CONTROL MODULE CIRCUIT. 1) Disconnect harness connector of body integrated unit. 2) Measure the resistance between harness connector terminals. <i>Connector & terminal (i84) No. 9 — (i96) No. 3:</i>	Is the resistance less than 10 Ω?	Replace the keyless entry control module. <Ref. to SL-52, Keyless Entry Control Unit.>	Repair the harness.

Keyless Entry System

SECURITY AND LOCKS

5. CHECK BODY INTEGRATED UNIT POWER SUPPLY, GROUND CIRCUIT AND REGISTERED CONNECTOR CIRCUIT

Step	Check	Yes	No
1 CHECK REGISTRATION CONNECTOR INPUT VOLTAGE. Measure the voltage between the body integrated unit harness connector and chassis ground. <i>Connector & terminal</i> <i>(B281) No. 22 (+) — Chassis ground (-):</i>	Is the voltage more than 10 V?	Go to step 2.	Check the registration connector for disconnection, and the harness for short.
2 CHECK POWER SUPPLY OF BODY INTEGRATED UNIT. 1) Disconnect the harness connector of body integrated unit. 2) Measure the voltage between the harness connector terminal and chassis ground. <i>Connector & terminal</i> <i>(B280) No. 7 (+) — Chassis ground (-):</i> <i>(B281) No. 2 (+) — Chassis ground (-):</i>	Is the voltage more than 10 V?	Go to step 3.	Check the harness for open or short between body integrated unit and fuse.
3 CHECK BODY INTEGRATED UNIT GROUND CIRCUIT. 1) Disconnect the harness connector of body integrated unit. 2) Measure the resistance between the harness connector terminal and chassis ground. <i>Connector & terminal</i> <i>(B280) No. 22 — Chassis ground:</i> <i>(B281) No. 8 — Chassis ground:</i> <i>(B281) No. 9 — Chassis ground:</i>	Is the resistance less than 10 Ω ?	Check the body integrated unit. <Ref. to LAN(diag)-2, Basic Diagnostic Procedure.>	Repair the harness.

6. CHECK DOOR SWITCH

Step	Check	Yes	No
<p>1</p> <p>CHECK DOOR SWITCH CIRCUIT. Measure the voltage between the body integrated unit harness connector terminal and chassis ground.</p> <p>Connector & terminal Front door RH: <i>(i84) No. 32 (+) — Chassis ground (-):</i> Front door LH: <i>(i84) No. 19 (+) — Chassis ground (-):</i> Rear door RH: <i>(i84) No. 18 (+) — Chassis ground (-):</i> Rear door LH: <i>(i84) No. 31 (+) — Chassis ground (-):</i> Rear gate: <i>(i84) No. 17 (+) — Chassis ground (-):</i></p>	<p>Is the voltage 0 V when each door or rear gate is opened?</p>	<p>Go to step 2.</p>	<p>Go to step 3.</p>
<p>2</p> <p>CHECK DOOR SWITCH CIRCUIT. Measure the voltage between the body integrated unit harness connector terminal and chassis ground.</p> <p>Connector & terminal Front door RH: <i>(i84) No. 32 (+) — Chassis ground (-):</i> Front door LH: <i>(i84) No. 19 (+) — Chassis ground (-):</i> Rear door RH: <i>(i84) No. 18 (+) — Chassis ground (-):</i> Rear door LH: <i>(i84) No. 31 (+) — Chassis ground (-):</i> Rear gate: <i>(i84) No. 17 (+) — Chassis ground (-):</i></p>	<p>Is the voltage more than 10 V when each door or rear gate is closed?</p>	<p>The door switch is OK.</p>	<p>Go to step 3.</p>
<p>3</p> <p>CHECK DOOR SWITCH. 1) Disconnect the door switch harness connector. 2) Measure the resistance between door switch terminals.</p> <p>Connector & terminal (R12) Front RH door switch: (R9) Front LH door switch: (R16) Rear RH door switch: (R22) Rear LH door switch: No. 1 — No. 3: Rear gate latch switch (Wagon model): (D46) No. 1 — No. 2:</p>	<p>Is the resistance more than 1 MΩ when door switch is pushed?</p>	<p>Go to step 4.</p>	<p>Replace the door switch.</p>
<p>4</p> <p>CHECK DOOR SWITCH. Measure the resistance between door switch terminals.</p> <p>Connector & terminal (R12) Front RH door switch: (R9) Front LH door switch: (R16) Rear RH door switch: (R22) Rear LH door switch: No. 1 — No. 3: Rear gate latch switch (Wagon model): (D46) No. 1 — No. 2:</p>	<p>Is the resistance less than 1 Ω when door switch is released?</p>	<p>Check the harness for open or short between body integrated unit and door switch.</p>	<p>Replace the door switch.</p>

Keyless Entry System

SECURITY AND LOCKS

7. CHECK KEY WARNING SWITCH

	Step	Check	Yes	No
1	CHECK FUSE. Remove and visually check the fuse No. 14 (in the main fuse box).	Is the fuse blown out?	Replace the fuse with a new one.	Go to step 2.
2	CHECK KEY WARNING SWITCH CIRCUIT. 1) Disconnect the harness connector of body integrated unit. 2) Insert the key into ignition switch. (LOCK position) 3) Measure the voltage between the harness connector terminal and chassis ground. Connector & terminal (B281) No. 7 (+) — Chassis ground (-):	Is the voltage more than 10 V?	Go to step 3.	Go to step 4.
3	CHECK KEY WARNING SWITCH CIRCUIT. 1) Remove the key from ignition switch. 2) Measure the voltage between the harness connector terminal and chassis ground. Connector & terminal (B281) No. 7 (+) — Chassis ground (-):	Is the voltage 0 V?	The key warning switch is OK.	Go to step 4.
4	CHECK KEY WARNING SWITCH. 1) Disconnect the key warning switch harness connector. 2) Insert the key into ignition switch. (LOCK position) 3) Measure the resistance between key warning switch terminals. Connector & terminal (B350) No. 3 — No. 4:	Is the resistance less than 1 Ω ?	Go to step 5.	Replace the key warning switch.
5	CHECK KEY WARNING SWITCH. 1) Remove the key from ignition switch. 2) Measure the resistance between key warning switch terminals. Connector & terminal (B350) No. 3 — No. 4:	Is the resistance more than 1 M Ω ?	Check the following: <ul style="list-style-type: none"> • Harness for open circuits and shorts between the key warning switch and fuse • Harness for open or short between the body integrated unit and key warning switch 	Replace the key warning switch.

8. CHECK ROOM LIGHT OPERATION

Step	Check	Yes	No
1 CHECK ROOM LIGHT OPERATION. Make sure the room light illuminates when the room light switch is turned to ON.	Does the room light illuminate?	Go to step 2.	Check the room light circuit.
2 CHECK HARNESS BETWEEN ROOM LIGHT AND BODY INTEGRATED UNIT. 1) Disconnect the body integrated unit harness connector and room light harness connector. 2) Measure the resistance between the body integrated unit harness connector terminal and room light harness connector terminal. <i>Connector & terminal</i> <i>(B280) No. 3 — (R52) No. 2:</i>	Is the resistance less than 10 Ω ?	The room light operation circuit is OK.	Check the harness for open or short between body integrated unit and room light.

9. CHECK HAZARD LIGHT OPERATION

Step	Check	Yes	No
1 CHECK HAZARD LIGHT OPERATION. Make sure the hazard light blinks when hazard switch is turned to ON.	Does the hazard light blink?	Go to step 2.	Check the hazard light circuit.
2 CHECK OUTPUT TO HAZARD LIGHT. 1) Turn the ignition switch to OFF. 2) Disconnect the key warning switch harness connector. 3) Connect the Subaru Select Monitor to data link connector. 4) Turn the ignition switch to ON. 5) Select {Body integrated unit} from main menu. 6) Select {ECM customizing}. 7) Check {Hazard answer-back setup}, and then switch to ON setting if necessary. 8) Select {Current Data Display & Save}. 9) When operating the LOCK/UNLOCK button of transmitter, check the hazard output signal of body integrated unit.	Is output signal present when operating the transmitter LOCK/UNLOCK button?	Go to step 3.	Check the body integrated unit. <Ref. to LAN(diag)-2, Basic Diagnostic Procedure.>
3 CHECK CIRCUIT OF HAZARD LIGHT. 1) Disconnect the harness connector of body integrated unit. 2) Disconnect the turn signal & hazard unit harness connector. 3) Measure the resistance between harness connector terminals. <i>Connector & terminal</i> <i>(B280) No. 12 — (B32) No. 8:</i>	Is the resistance less than 10 Ω ?	Check the body integrated unit. <Ref. to LAN(diag)-2, Basic Diagnostic Procedure.>	Repair the harness.

Keyless Entry System

SECURITY AND LOCKS

10.CHECK TRUNK LID LOCK ACTUATOR

Step	Check	Yes	No
1 CHECK TRUNK LID LOCK ACTUATOR. 1) Turn the ignition switch to OFF. 2) Disconnect the key warning switch harness connector. 3) Connect the Subaru Select Monitor to data link connector. 4) Turn the ignition switch to ON. 5) Select {Body integrated unit} from main menu. 6) Select {Current Data Display & Save}. 7) When operating the TRUNK button of transmitter, check the trunk unlock output signal of body integrated unit.	Is output signal present when operating the transmitter TRUNK button?	Go to step 2.	Check the body integrated unit. <Ref. to LAN(diag)-2, Basic Diagnostic Procedure.>
2 CHECK THE CIRCUIT OF TRUNK LID ACTUATOR. 1) Disconnect harness connector of body integrated unit. 2) Disconnect the trunk lid actuator harness connector. 3) Measure the resistance between harness connectors. Connector & terminal (i84) No. 22 — (R186) No. 2:	Is the resistance less than 10 Ω ?	Go to step 3.	Repair the harness.
3 CHECK THE GROUND CIRCUIT OF TRUNK LID ACTUATOR. 1) Disconnect the trunk lid actuator harness connector. 2) Measure the resistance between the harness connector terminal and chassis ground. Connector & terminal (R186) No. 1 — Chassis ground:	Is the resistance less than 10 Ω ?	Check the trunk lid lock actuator. <Ref. to SL-43, Trunk Lid Lock Assembly.>	Repair the harness.

11.CHECK DOOR LOCK SWITCH

Step	Check	Yes	No
1 CHECK DOOR LOCK SWITCH. Check the input signal from door lock switch to body integrated module using Subaru Select Monitor. 1) Connect the Subaru Select Monitor to data link connector. 2) Turn the ignition switch to ON. 3) Select {Body integrated unit} from main menu. 4) Select {Current Data Display & Save}. 5) Check the input signal to body integrated unit by operating the door lock switch.	Is the normal input signal displayed when the door lock switch is moved to LOCK/UNLOCK?	The door lock switch is OK.	Go to step 2.
2 CHECK DOOR LOCK SWITCH CIRCUIT. 1) Disconnect the body integrated unit harness connector. 2) Measure the resistance between the harness connector terminal and chassis ground when moving the door lock switch to LOCK. Connector & terminal (i84) No. 15 — Chassis ground:	Is the resistance less than 10 Ω ?	Go to step 3.	Go to step 4.

Keyless Entry System

SECURITY AND LOCKS

Step	Check	Yes	No
3 CHECK DOOR LOCK SWITCH CIRCUIT. Measure the resistance between the harness connector terminal and chassis ground when the door lock switch is moved to UNLOCK. Connector & terminal <i>(i84) No. 29 — Chassis ground:</i>	Is the resistance less than 10 Ω ?	The door lock switch is OK.	Go to step 4.
4 CHECK DOOR LOCK SWITCH. 1) Disconnect the door lock switch harness connector. 2) Measure the resistance between the door lock switch terminals when moving the door lock switch to LOCK. Connector & terminal Driver's side: <i>(D7) No. 4 — No. 7:</i> Passenger's side: <i>(D125) No. 4 — No. 3:</i>	Is the resistance less than 1 Ω ?	Go to step 5.	Replace the door lock switch.
5 CHECK DOOR LOCK SWITCH. Measure the resistance between the door lock switch terminals when moving the door lock switch to UNLOCK. Connector & terminal Driver's side: <i>(D7) No. 5 — No. 7:</i> Passenger's side: <i>(D125) No. 1 — No. 3:</i>	Is the resistance less than 1 Ω ?	Check the harness for open circuits or shorts between the body integrated unit and the door lock switch.	Replace the door lock switch.

12.CHECK IGNITION SWITCH ILLUMINATION

Step	Check	Yes	No
1 CHECK FUSE. Remove and visually check the fuse No. 14 (in the main fuse box).	Is the fuse blown out?	Replace the fuse with a new one.	Go to step 2.
2 CHECK POWER SUPPLY. 1) Disconnect the ignition switch illumination harness connector. 2) Measure the voltage between the harness connector terminal and chassis ground. Connector & terminal <i>(B224) No. 2 (+) — Chassis ground (-):</i>	Is the voltage more than 10 V?	Go to step 3.	Check the harness for open circuits and shorts between the ignition switch illumination and fuse.
3 CHECK IGNITION SWITCH ILLUMINATION CIRCUIT. 1) Disconnect the harness connector of body integrated unit and ignition switch illumination harness connector. 2) Measure the resistance between body integrated unit harness connector terminal and ignition switch illumination harness connector terminal. Connector & terminal <i>(B280) No. 4 — (B224) No. 1:</i>	Is the resistance less than 10 Ω ?	Replace the ignition switch illumination bulb with a new one. <Ref. to LI-35, REMOVAL, Ignition Switch Illumination.>	Check the harness for open circuits and shorts between the body integrated unit and ignition switch illumination.

Keyless Entry System

SECURITY AND LOCKS

13.CHECK HORN OPERATION

	Step	Check	Yes	No
1	CHECK HORN OPERATION. Make sure the horn sounds when the horn switch is pushed.	Does the horn sound?	Go to step 2.	Check the horn circuit.
2	CHECK HORN OPERATION. 1) Disconnect the body integrated unit harness connector. 2) Ground the harness connector terminal with a suitable wire. Connector & terminal (B280) No. 11 — Chassis ground:	Does the horn sound?	Check the body integrated unit. <Ref. to LAN(diag)-2, Basic Diagnostic Procedure.>	Check the harness for open circuits and/or shorts between the body integrated unit and horn relay.

14.CHECK KEYLESS BUZZER

	Step	Check	Yes	No
1	CHECK KEYLESS BUZZER ON/OFF SWITCH. 1) Press the UNLOCK button of transmitter once. 2) Press the LOCK/UNLOCK button of transmitter for more than 2 seconds at the same time. 3) When the keyless buzzer is set to ON, buzzer beeps twice, and once when the keyless buzzer is set to OFF. 4) Set the keyless buzzer to ON, and check if the buzzer beeps while operating LOCK/UNLOCK button.	Does the buzzer beep?	Keyless buzzer is normal.	Go to step 2.
2	CHECK FOR POWER SUPPLY OF KEYLESS BUZZER. 1) Turn the ignition switch to OFF. 2) Disconnect the keyless buzzer harness connector. 3) Measure the voltage between the harness connector terminal and chassis ground. Connector & terminal (F102) No. 1 (+) — Chassis ground (-):	Is the voltage more than 10 V?	Go to step 3.	Check the harness for open circuits and shorts between the keyless buzzer and fuse.
3	CHECK FOR GROUND CIRCUIT OF KEYLESS BUZZER. 1) Disconnect the body integrated unit harness connector. 2) Measure the resistance between harness connector terminals. Connector & terminal (i84) No. 6 — (F102) No. 2:	Is the resistance less than 10 Ω ?	Go to step 4.	Repair the harness.
4	CHECK KEYLESS BUZZER. 1) Remove the keyless buzzer. 2) Install the keyless buzzer to another vehicle which operates keyless buzzer normally, check the buzzer sounds.	Does the keyless buzzer sound?	Check the body integrated unit. <Ref. to LAN(diag)-2, Basic Diagnostic Procedure.>	Replace the key buzzer.

15.CHECK IGNITION SWITCH

Step	Check	Yes	No
1 CHECK FUSIBLE LINK. Remove the fusible link main SBF and SBF-6 (in main fuse box), and visually check.	Is the fusible link blown out?	Replace the fusible link main SBF or SBF-6. If the replace fusible link blown out easily, repair short circuit in harness between fusible link and ignition switch.	Go to step 2.
2 CHECK FOR POWER SUPPLY OF IGNITION SWITCH. 1) Disconnect the ignition switch harness connector. 2) Measure the voltage between harness connector terminal and body ground. <i>Connector & terminal</i> <i>(B72) No. 3 (+) — Chassis ground (-):</i>	Is the voltage more than 10 V?	Go to step 3.	Check the harness for open circuits and shorts between the ignition switch and fusible link.
3 CHECK IGNITION SWITCH. 1) Insert the ignition key into ignition switch, and turn the each position. 2) Measure the resistance between ignition switch terminals. <i>Connector & terminal</i> <i>No. 3 — No. 4 (ACC position):</i> <i>No. 3 — No. 4 — No. 6 — No. 1 (ON position):</i> <i>No. 3 — No. 6 — No. 1 — No. 2 (ST position):</i>	Is the resistance less than 1 Ω when ignition key turn the each position?	Ignition switch is normal.	Replace the ignition switch with a new one. <Ref. to SL-48, REPLACEMENT, Ignition Key Lock.>

CAUTION:

When the ignition key lock is replaced, all ignition keys also must be registered. <Refer to “IMMOBILIZER TEACHING OPERATION MANUAL”>

4. Security System

A: WIRING DIAGRAM

<Ref. to WI-186, WIRING DIAGRAM, Security System.>

B: ELECTRICAL SPECIFICATION

Remarks	Terminal No.	Measuring conditions
Ignition switch	A1 (INPUT)	Battery voltage is present when ignition switch is turned to ON.
Door key cylinder switch	A3	0 V is present when door key cylinder is moved to LOCK side.
Keyless entry control module	A9 (INPUT)	Communication line (Cannot be measured because of digital signal)
Door key cylinder switch	A12	0 V is present when door key cylinder is moved to UNLOCK side.
Trunk lid switch or rear gate latch switch	A17 (INPUT)	0 V is present when the trunk lid or rear gate is opened.
Rear door switch RH	A18 (INPUT)	0 V is present when the rear door RH is opened.
Front door switch LH	A19 (INPUT)	0 V is present when the front door LH is opened.
Rear door switch LH	A31 (INPUT)	0 V is present when the rear door LH is opened.
Front door switch RH	A32	0 V is present when the front door RH is opened.
Security indicator light	A33(INPUT)	Battery voltage is present when the alarm operation is activated.
Horn relay	B11 (OUTPUT)	Battery voltage is present when the alarm operation is activated.
Turn signal & hazard circuit	B12 (OUTPUT)	Battery voltage is present when the alarm operation is activated.
Ground	B22	0 V is constantly present.
Power supply	C2	Battery voltage is constantly present.
Impact sensor	C5	When not applying vibration to impact sensor, it repeat the 0 V and battery voltage in every 45 milliseconds.
Ground	C8	0 V is constantly present.
Ground	C9	0 V is constantly present.

C: INSPECTION

1. BASIC DIAGNOSTICS PROCEDURE

Step	Check	Yes	No
1 INITIAL CHECK. Check the keyless entry system.	Does the keyless entry system operate normally?	Go to step 2.	Check the keyless entry system. <Ref. to SL-12, INSPECTION, Keyless Entry System.>
2 CHECK SECURITY ON/OFF SETTING. 1) Remove the key from ignition switch, and then close all doors. 2) Press the UNLOCK button of transmitter. 3) Check the security indicator light blinking patterns.	Are the security indicator light blinking patterns as follows? • Model with immobilizer: Blinks in every 3 seconds • Model without immobilizer: Always off	Go to step 3.	Check the security indicator light circuit. <Ref. to SL-30, CHECK SECURITY INDICATOR LIGHT CIRCUIT, INSPECTION, Security System.>
3 CHECK SECURITY ON/OFF SETTING. 1) Press the LOCK button of transmitter. 2) Check the security indicator light blinking patterns.	Are the security indicator light blinking patterns as follows? • When the setting of checking lag 0 seconds: Blink twice within 0.5 second in 2 seconds cycle • When the setting of checking lag 30 seconds: Blink three times within 1 second in 0.4 seconds cycle	Go to step 6.	Go to step 4.
4 CHANGE SETTING OF SECURITY SYSTEM. Change the setting of security system to ON. <Ref. to SL-27, SECURITY SYSTEM ON/OFF SETTING, INSPECTION, Security System.>	Is the setting change completed correctly?	Go to step 5.	<ul style="list-style-type: none"> • Check the ignition switch circuit. <Ref. to SL-31, CHECK IGNITION SWITCH CIRCUIT, INSPECTION, Security System.> • Check the door lock switch circuit. <Ref. to SL-20, CHECK DOOR LOCK SWITCH, INSPECTION, Keyless Entry System.>
5 CHECK SETTING CHANGE OF SECURITY SYSTEM. 1) Remove the key from ignition switch, and then close all doors. 2) Press the LOCK button of transmitter. 3) Check the security indicator light blinking patterns.	Are the security indicator light blinking patterns as follows? • When the setting of checking lag 0 seconds: Blink twice within 0.5 second in 2 seconds cycle • When the setting of checking lag 30 seconds: Blink three times within 1 second in 0.4 seconds cycle	Go to step 6.	Replace the body integrated unit. <Ref. to SL-54, Body Integrated Unit.>
6 CHECK SECURITY SYSTEM OPERATION. Press the LOCK button on the transmitter and wait for 30 seconds.	Is the blinking pattern of security indicator light “blink twice within 0.5 second in 2 seconds cycle”?	Go to step 7.	Replace the body integrated unit. <Ref. to SL-54, Body Integrated Unit.>

Security System

SECURITY AND LOCKS

Step	Check	Yes	No
7 CHECK SECURITY SYSTEM CANCEL OPERATION. Insert the key to door key cylinder to unlock.	Is the blinking pattern of security indicator light as follows? <ul style="list-style-type: none"> • Model with immobilizer: Blinking in 3-seconds interval • Model without immobilizer: OFF all the time 	Press the LOCK button of transmitter, and wait for 30 seconds. Go to step 8 .	Check door key cylinder circuit. <Ref. to SL-32, CHECK DOOR KEY CYLINDER SWITCH AND CIRCUIT, INSPECTION, Security System.>
8 CHECK SECURITY ALARM OPERATION. 1) Unlock all doors using the door lock switch on driver's door. 2) Open any door, trunk or rear gate.	Does the security alarm operate when opening any door, trunk or rear gate?	Go to step 9 .	<ul style="list-style-type: none"> • Check the door switch. <Ref. to SL-28, CHECK DOOR SWITCH, INSPECTION, Security System.> • Check the trunk lid switch or rear gate latch switch. <Ref. to SL-29, CHECK TRUNK LID SWITCH (SEDAN) OR REAR GATE LATCH SWITCH (WAGON), INSPECTION, Security System.>
9 CHECK SECURITY ALARM OPERATION. Check the security alarm operation.	Does all security alarm operate? <ul style="list-style-type: none"> • Horn sounds • Hazard light blinks • Security indicator light on 	Go to step 10 .	<ul style="list-style-type: none"> • Check the horn. <Ref. to SL-30, CHECK HORN, INSPECTION, Security System.> • Check the hazard light. <Ref. to SL-31, CHECK HAZARD LIGHT OPERATION, INSPECTION, Security System.>
10 CHECK SECURITY ALARM CANCEL OPERATION. Press any button of transmitter while operating security alarm. Or turn the ignition switch OFF/ON three times.	Does all security alarm stop? <ul style="list-style-type: none"> • Horn • Hazard light 	Go to step 11 .	Check the ignition switch circuit. <Ref. to SL-31, CHECK IGNITION SWITCH CIRCUIT, INSPECTION, Security System.>
11 CHECK SECURITY SYSTEM CONDITION MEMORY. Check if the system function properly when the battery is not connected temporarily. <Ref. to SL-27, CHECK SECURITY SYSTEM CONDITION MEMORY, INSPECTION, Security System.>	Does the system function properly when the battery is not connected temporarily?	Go to step 12 .	Replace the body integrated unit. <Ref. to SL-54, Body Integrated Unit.>

Step	Check	Yes	No
12 CHECK IMPACT SENSOR. Check the impact sensor. <Ref. to SL-51, CHECK IMPACT SENSOR, ADJUSTMENT, Impact Sensor.>	Is the sensibility set properly?	Press the UNLOCK button of transmitter, and finish the diagnosis.	Adjust the sensibility. <Ref. to SL-51, IMPACT SENSITIVITY ADJUSTMENT, ADJUSTMENT, Impact Sensor.>

CAUTION:

- **Security alarm ON/OFF setting**

At the time of shipping from the plant, the security alarm is set to “ON”. However, when {Security setting initialization} is performed with the Subaru select monitor, the security alarm automatically is set to “OFF”. When security initialization has been performed, always return the ON/OFF setting for the security alarm to “ON”.

- **Siren YES/NO setting**

The {Siren YES/NO} setting of the item {Unit customization} of the Subaru select monitor always shall be set “NO”. If it is set to “YES”, the horn of the security alarm will not sound.

NOTE:

When the following symptoms appear, inspect the function setting of body integrated unit. <Ref. to LAN(diag)-2, Basic Diagnostic Procedure.>

- The horn does not sound although security is operating.
- When the security is turned on by transmitter, the horn sounds.

2. CHECK SECURITY SYSTEM CONDITION MEMORY

- 1) Remove the key from ignition switch.
- 2) Close all the doors, trunk lid and rear gate.
- 3) Open the hood.
- 4) Press the LOCK button of transmitter, and then wait until the security indicator light flashes twice for 0.5 sec at intervals of 2 seconds.
- 5) Disconnect the ground cable from battery.
- 6) Connect the battery ground cable to battery.
- 7) Check that the security indicator light blinks twice within 0.5 seconds in 2 seconds cycle. When it does not blink, replace the body integrated unit.

3. SECURITY SYSTEM ON/OFF SETTING

- 1) Close all the doors and rear gate, sit down on the driver seat. Press the UNLOCK button of transmitter.
- 2) Repeat turning the ignition switch to ON → OFF three times within 10 seconds, and then stop at ON position.
- 3) Open the driver’s door and close it within 10 seconds. At this time, horn and current setting is displayed on trip meter.
- 4) Operate the door lock switch as follows within 10 seconds. After the operation, horn.

Setting	Door lock switch operation	Meter display
OFF	Press three times to UNLOCK side	[AL_OF]
ON	Press three times to LOCK side	[AL_ON]

Security System

SECURITY AND LOCKS

4. CHECK DOOR SWITCH

Step	Check	Yes	No
1 CHECK INPUT FROM EACH DOOR SWITCH. 1) Connect the Subaru Select Monitor to data link connector. 2) Turn the ignition switch to ON. 3) Select {body integrated module} from main menu. 4) Select {Current Data Display & Save}. 5) Check the door switch input to the body integrated unit when opening the each door (front RH and LH, rear RH and LH).	Is the input signal present when opening each door (front RH and LH, rear RH and LH)?	The door switch circuit is OK.	When the input signal cannot be detected in some door switch, Go to step 2 .
2 CHECK DOOR SWITCH CIRCUIT. 1) Turn the ignition switch to OFF. 2) Disconnect the harness connector of body integrated unit. 3) Disconnect the harness connector of faulty door switch. 4) Measure the resistance between harness connector terminals. Connector & terminal <i>(i84) No. 19 — (R12) No. 1: (front door LH)</i> <i>(i84) No. 32 — (R9) No. 1: (front door RH)</i> <i>(i84) No. 31 — (R22) No. 1:(rear door LH)</i> <i>(i84) No. 18 — (R16) No. 1: (rear door RH)</i>	Is the resistance less than 10 Ω?	Go to step 3 .	Repair the harness.
3 CHECK GROUND CIRCUIT OF DOOR SWITCH. 1) Disconnect the harness connector of faulty door switch. 2) Measure the resistance of harness connector and chassis ground. Connector & terminal <i>(R9) No. 3 — Chassis ground: (front door LH)</i> <i>(R12) No. 3 — Chassis ground: (front door RH)</i> <i>(R22) No. 3 — Chassis ground: (rear door LH)</i> <i>(R16) No. 3 — Chassis ground: (rear door RH)</i>	Is the resistance less than 10 Ω?	Go to step 4 .	Repair the harness.
4 CHECK DOOR SWITCH. 1) Disconnect the harness connector of faulty door switch. 2) Measure the resistance between the door switch terminals. Terminals No. 1 — No. 3:	Is the resistance more than 1 MΩ when door switch is pushed?	Go to step 5 .	Replace the door switch.
5 CHECK DOOR SWITCH. Measure the resistance between the door switch terminals. Terminals No. 1 — No. 3:	Is the resistance less than 1 Ω when door switch is released?	Check the body integrated unit. <Ref. to LAN(diag)-2, Basic Diagnostic Procedure.>	Replace the door switch.

5. CHECK TRUNK LID SWITCH (SEDAN) OR REAR GATE LATCH SWITCH (WAGON)

Step	Check	Yes	No
1 CHECK INPUT FROM TRUNK LID SWITCH OR REAR GATE LATCH SWITCH. 1) Connect the Subaru Select Monitor to data link connector. 2) Turn the ignition switch to ON. 3) Select {body integrated module} from main menu. 4) Select {Current Data Display & Save}. 5) Check the input signal to the body integrated unit when opening the trunk lid or rear gate.	Is the input signal present when opening the trunk lid or rear gate?	The trunk lid switch or rear gate latch switch is OK.	Go to step 2.
2 CHECK CIRCUIT FOR TRUNK LID SWITCH OR REAR GATE LATCH SWITCH. 1) Turn the ignition switch to OFF. 2) Disconnect the harness connector of body integrated unit. 3) Disconnect the harness connector of trunk lid switch or rear gate latch switch. 4) Measure the resistance between harness connector terminals. Connector & terminal <i>(i84) No. 17 — (D46) No. 2: (Wagon model)</i> <i>(i84) No. 17 — (R186) No. 3: (Sedan model)</i>	Is the resistance less than 10 Ω ?	Go to step 3.	Repair the harness.
3 CHECK GROUND CIRCUIT FOR TRUNK LID SWITCH OR REAR GATE LATCH SWITCH. 1) Disconnect the harness connector of trunk lid switch or rear gate latch switch. 2) Measure the resistance between the harness connector terminal and chassis ground. Connector & terminal <i>(D46) No. 1 — Chassis ground: (Wagon model)</i> <i>(R186) No. 1 — Chassis ground: (Sedan model)</i>	Is the resistance less than 10 Ω ?	Go to step 4.	Repair the harness.
4 CHECK TRUNK LID SWITCH OR REAR GATE LATCH SWITCH. 1) Disconnect the harness connector of trunk lid switch or rear gate latch switch. 2) Measure the resistance between switch terminals. Terminals <i>No. 1 — No. 2: (Wagon model)</i> <i>No. 1 — No. 3: (Sedan model)</i>	Is the resistance more than 1 M Ω when switch is pushed?	Go to step 5.	Replace the trunk lid switch or rear gate latch switch.
5 CHECK TRUNK LID SWITCH OR REAR GATE LATCH SWITCH. Measure the resistance between switch terminals. Terminals <i>No. 1 — No. 2: (Wagon model)</i> <i>No. 1 — No. 3: (Sedan model)</i>	Is the resistance less than 1 Ω when switch is released?	Check the body integrated unit. <Ref. to LAN(diag)-2, Basic Diagnostic Procedure.>	Replace the trunk lid switch or rear gate latch switch.

Security System

SECURITY AND LOCKS

6. CHECK SECURITY INDICATOR LIGHT CIRCUIT

Step	Check	Yes	No
1 CHECK SECURITY INDICATOR LIGHT. 1) Turn the ignition switch to OFF. 2) Disconnect the harness connector of body integrated unit. 3) Connect the resistor (100 Ω) between body integrated unit harness connector terminal (i84) No. 33 and body ground. Connector & terminal (i84) No. 33 — Chassis ground:	Does the security indicator light illuminate?	Check the body integrated unit. <Ref. to LAN(diag)-2, Basic Diagnostic Procedure.>	Go to step 2.
2 CHECK POWER SUPPLY FOR SECURITY INDICATOR LIGHT. 1) Disconnect the connector from combination meter. 2) Measure the voltage between the combination meter harness connector terminal and chassis ground. Connector & terminal (i10) No. 1, 2 (+) — Chassis ground (-):	Is the voltage more than 10 V?	Go to step 3.	Check the harness for open or short circuit between combination meter and fuse.
3 CHECK SECURITY INDICATOR LIGHT CIRCUIT. Measure the resistance between the combination meter harness connector terminal and security control unit harness connector terminal. Connector & terminal (i10) No. 17 — (i84) No. 33:	Is the resistance less than 10 Ω?	Replace the combination meter. <Ref. to IDI-15, Combination Meter.>	Check the harness for open or short circuit between combination meter and body integrated unit.

7. CHECK HORN

Step	Check	Yes	No
1 CHECK HORN OPERATION. Check the horn sounds when the horn switch is pushed.	Does the horn sound?	Go to step 2.	Check the horn circuit.
2 CHECK OUTPUT TO HORN RELAY. 1) Connect the Subaru Select Monitor to data link connector. 2) Turn the ignition switch to ON. 3) Select {body integrated module} from main menu. 4) Select {Function Check}. 5) Select {Horn Output} and perform.	Does the horn sound?	Horn circuit is OK.	Go to step 3.
3 CHECK HORN RELAY CIRCUIT. 1) Turn the ignition switch to OFF. 2) Disconnect the harness connector of body integrated unit. 3) Disconnect the main fuse box harness connector (B186). 4) Measure the resistance between harness connector terminals. Connector & terminal (B280) No. 11 — (B186) No. 1:	Is the resistance less than 10 Ω?	Check the body integrated unit. <Ref. to LAN(diag)-2, Basic Diagnostic Procedure.>	Repair the harness.

8. CHECK HAZARD LIGHT OPERATION

Step	Check	Yes	No
1 CHECK HAZARD LIGHT OPERATION. Make sure the hazard light blinks when hazard switch is turned to ON.	Does the hazard light blink?	Go to step 2.	Check the hazard light circuit.
2 CHECK OUTPUT TO HAZARD LIGHT. 1) Turn the ignition switch to OFF. 2) Disconnect the key warning switch harness connector. 3) Connect the Subaru Select Monitor to data link connector. 4) Turn the ignition switch to ON. 5) Select {body integrated module} from main menu. 6) Select the {ECM customizing}. 7) Check the {Hazard answer-back setup}, and then switch to ON setting. 8) Select {Current Data Display & Save}. 9) When operating the LOCK/UNLOCK button of transmitter, check the hazard output signal of body integrated unit.	Is output signal is present when operating the transmitter LOCK/UNLOCK button?	Go to step 3.	Check the body integrated unit. <Ref. to LAN(diag)-2, Basic Diagnostic Procedure.>
3 CHECK CIRCUIT OF HAZARD LIGHT. 1) Turn the ignition switch to OFF. 2) Disconnect the harness connector of body integrated unit. 3) Disconnect the turn signal& hazard unit harness connector. 4) Measure the resistance between harness connector terminals. Connector & terminal (B280) No. 12 — (B32) No. 8:	Is the resistance less than 10 Ω ?	Check the body integrated unit. <Ref. to LAN(diag)-2, Basic Diagnostic Procedure.>	Repair the harness.

9. CHECK IGNITION SWITCH CIRCUIT

Step	Check	Yes	No
1 CHECK IGNITION SWITCH VOLTAGE. 1) Connect the Subaru Select Monitor to data link connector. 2) Turn the ignition switch to ON. 3) Select {body integrated module} from main menu. 4) Select {Current Data Display & Save}. 5) Check the {BATT voltage} and {IG power supply voltage}.	Is the {IG power supply voltage} within ± 1 V against {BATT voltage}?	The ignition switch input circuit is OK.	Go to step 2.
2 CHECK IGNITION SWITCH CIRCUIT. 1) Turn the ignition switch to OFF. 2) Disconnect harness connector of body integrated unit. 3) Turn the ignition switch to ON. 4) Measure the voltage between the harness connector terminal and chassis ground. Connector & terminal (i84) No. 1 (+) — Chassis ground (-):	Is the voltage more than 10 V?	Check the body integrated unit. <Ref. to LAN(diag)-2, Basic Diagnostic Procedure.>	Check harness for open or short circuit between body integrated unit and fuse.

Security System

SECURITY AND LOCKS

10.CHECK DOOR KEY CYLINDER SWITCH AND CIRCUIT

Step	Check	Yes	No
1 CHECK DOOR KEY CYLINDER SWITCH CIRCUIT. Measure the resistance between harness connector terminal and chassis ground when turning the door key cylinder switch to UNLOCK. Connector & terminal <i>(i84) No. 12 — Chassis ground:</i>	Is the resistance less than 10 Ω ?	Door key cylinder switch is OK.	Go to step 2.
2 CHECK DOOR KEY CYLINDER SWITCH. 1) Disconnect the door key cylinder switch connector. 2) Measure the resistance between door key cylinder switch terminals when turning the door key cylinder switch to LOCK. Terminals No. 1 — No. 2	Is the resistance less than 1 Ω ?	Go to step 3.	Replace the door key cylinder switch.
3 CHECK DOOR KEY CYLINDER SWITCH. Measure the resistance between door key cylinder switch terminals when turning the door key cylinder switch to UNLOCK. Terminals No. 2 — No. 3	Is the resistance less than 1 Ω ?	Check the harness for open or short circuits between body integrated unit and door key cylinder switch.	Replace the door key cylinder switch.

5. Front Inner Remote

A: REMOVAL

- 1) Remove the door trim. <Ref. to EI-48, REMOVAL, Door Trim.>
- 2) Remove the back cover (1) of inner remote.
- 3) Remove the cable (2).
- 4) Remove the cable end ball (3).
- 5) Remove the screws (4), and detach the inner remote.

B: INSTALLATION

Install in the reverse order of removal.

NOTE:

Make sure the inner remote works correctly after installation.

C: INSPECTION

- 1) Check the door opener and door lock cable for deformation. When it is deformed, straighten it because failure operations may occur. When it is unrepairable, replace the front door latch & door lock actuator assembly.
- 2) Check the handle and cable for smooth operation.

6. Front Outer Handle

A: REMOVAL

- 1) Raise the front door glass to the top position.
- 2) Remove the door trim. <Ref. to EI-48, REMOVAL, Door Trim.>
- 3) Remove the cable from front inner remote. <Ref. to SL-33, REMOVAL, Front Inner Remote.>
- 4) Remove the sealing cover. <Ref. to EB-20, REMOVAL, Front Sealing Cover.>
- 5) Remove the rod clamps (1).
- 6) Remove the bolts (2), and then detach the front outer handle.

CAUTION:

Do not apply excessive force to remove the handle from door panel. Otherwise door panel may be deformed.

B: INSTALLATION

Install in the reverse order of removal.

NOTE:

Make sure the outer handle works correctly after installation.

C: INSPECTION

- 1) Check the rod for deformation.
- 2) Check the lever and rod for smooth operation.

7. Front Door Latch & Door Lock Actuator Assembly

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Remove the front door trim. <Ref. to EI-48, REMOVAL, Door Trim.>
- 3) Remove the cable from front inner remote. <Ref. to SL-33, REMOVAL, Front Inner Remote.>
- 4) Remove the sealing cover. <Ref. to EB-20, REMOVAL, Front Sealing Cover.>
- 5) Remove the front door glass. <Ref. to GW-11, REMOVAL, Front Door Glass.>
- 6) Remove the rear sash. <Ref. to GW-16, REMOVAL, Front Regulator and Motor Assembly.>
- 7) Open the handle rod cover of latch assembly.
- 8) Remove the three screws.

- 9) Remove the front door latch & door lock actuator assembly, and disconnect the connector.

B: INSTALLATION

Install in the reverse order of removal.

NOTE:

Make sure the lock works correctly after installation.

C: INSPECTION

- 1) Check the rod and cable for deformation. When it is deformed, straighten it because failure operations may occur. When it is unrepairable, replace the front door latch & door lock actuator assembly.
- 2) Check the lever, rod and cable for smooth operation.

8. Front Door Lock Actuator

A: REMOVAL

- 1) Remove the front door latch & door lock actuator assembly. <Ref. to SL-35, REMOVAL, Front Door Latch & Door Lock Actuator Assembly.>
- 2) Remove the pawl of front door latch security cover, and then remove the cover.
- 3) Remove the screw from the front door latch and door lock actuator, and then remove the door lock actuator.

(1) Front door lock actuator

B: INSTALLATION

Install in the reverse order of removal.

NOTE:

Make sure the lock works correctly after installation.

C: INSPECTION

- 1) Disconnect the door lock actuator harness connector.
- 2) Connect the battery to door lock actuator terminals.

If defective, replace the door lock actuator.

Terminal No.	Actuator operation
No. 2 (+) and No. 1 (-)	Unlocked → Locked
No. 1 (+) and No. 2 (-)	Locked → Unlocked

9. Rear Inner Remote

A: REMOVAL

- 1) Remove the rear door trim. <Ref. to EI-48, REMOVAL, Door Trim.>
- 2) Remove the back cover (1) of inner remote.
- 3) Remove the cable (2).
- 4) Remove the cable end ball (3).
- 5) Remove the screws (4), and detach the inner remote handle.

B: INSTALLATION

Install in the reverse order of removal.

NOTE:

Make sure the inner remote works correctly after installation.

C: INSPECTION

- 1) Check the door opener and door lock cable for deformation. When it is deformed, straighten it because failure operations may occur. When it is unrepairable, replace the rear door latch & door lock actuator assembly.
- 2) Check the handle and cable for smooth operation.
- 3) Check the child safety lock for correct operations.

10.Rear Outer Handle

A: REMOVAL

- 1) Raise the rear door glass to the top position.
- 2) Remove the rear door trim. <Ref. to EI-48, REMOVAL, Door Trim.>
- 3) Remove the sealing cover. <Ref. to EB-24, REMOVAL, Rear Sealing Cover.>
- 4) Remove the rear door latch assembly. <Ref. to SL-39, REMOVAL, Rear Door Latch & Door Lock Actuator Assembly.>
- 5) Remove the cable from cable clamp (1) of outer handle.
- 6) Remove the two bolts.

- 7) Detach the rear outer handle.

CAUTION:

Do not apply excessive force to remove the handle from door panel. Otherwise door panel may be deformed.

B: INSTALLATION

Install in the reverse order of removal.

NOTE:

Make sure the outer handle works correctly after installation.

C: INSPECTION

- 1) Check the cable for deformation. When it is deformed, straighten it because failure operations may occur. When it is unrepairable, replace the rear door latch & door lock actuator assembly.
- 2) Check the handle and cable for smooth operation.

11. Rear Door Latch & Door Lock Actuator Assembly

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Remove the rear door trim. <Ref. to EI-48, REMOVAL, Door Trim.>
- 3) Remove the cable from rear inner remote. <Ref. to SL-37, REMOVAL, Rear Inner Remote.>
- 4) Remove the sealing cover. <Ref. to EB-24, REMOVAL, Rear Sealing Cover.>
- 5) Remove the rear door glass. <Ref. to GW-24, REMOVAL, Rear Door Glass.>
- 6) Remove the rear sash. <Ref. to GW-26, REMOVAL, Rear Regulator and Motor Assembly.>
- 7) Take out the cable from cable clamp of outer handle.
- 8) Remove the three screws.

- 9) Disconnect the connectors, and then remove the rear door latch & door lock actuator assembly.

B: INSTALLATION

Install in the reverse order of removal.

NOTE:

Make sure the lock works correctly after installation.

C: INSPECTION

- 1) Check the cable for deformation. When it is deformed, straighten it because failure operations may occur. When it is unrepairable, replace the rear door latch & door lock actuator assembly.
- 2) Check the lever and cable for smooth operation.

12.Rear Door Lock Actuator

A: REMOVAL

- 1) Remove the rear door latch & door lock actuator assembly. <Ref. to SL-39, REMOVAL, Rear Door Latch & Door Lock Actuator Assembly.>
- 2) Remove the pawl of rear door latch security cover, and then remove the cover.
- 3) Remove the screw from the rear door latch and door lock actuator, and then remove the door lock actuator.

(1) Rear door lock actuator

B: INSTALLATION

Install in the reverse order of removal.

NOTE:

Make sure the lock works correctly after installation.

C: INSPECTION

- 1) Disconnect the door lock actuator harness connector.
- 2) Connect the battery to door lock actuator terminals.

If defective, replace the door lock actuator.

Terminal No.	Actuator operation
No. 2 (+) and No. 1 (-)	Unlocked → Locked
No. 1 (+) and No. 2 (-)	Locked → Unlocked

13.Rear Gate Outer Handle

A: REMOVAL

- 1) Remove the rear gate trim. <Ref. to EI-68, REMOVAL, Rear Gate Trim.>
- 2) Remove the rear gate garnish. <Ref. to EI-75, REMOVAL, Rear Gate Garnish.>
- 3) Remove the two nuts to take out the rear gate outer handle.
- 4) Remove the cable (1) or rear gate outer handle.

B: INSTALLATION

Install in the reverse order of removal.

NOTE:

Make sure the outer handle works correctly after installation.

C: INSPECTION

- 1) Check the cable of rear gate handle for deformation.
- 2) Check the rear gate outer handle and cable of rear gate handle for smooth operation.

Rear Gate Latch Assembly

14. Rear Gate Latch Assembly

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Remove the rear gate trim. <Ref. to EI-68, REMOVAL, Rear Gate Trim.>
- 3) Remove the two screws.

- 4) Disconnect the each connector and cable of rear gate handle.

- (1) Cable
- (2) Rear gate lock actuator connector
- (3) Rear gate latch switch connector

- 5) Remove the rear gate latch assembly.

B: INSTALLATION

Install in the reverse order of removal.

NOTE:

Make sure the lock works correctly after installation.

C: INSPECTION

- 1) Disconnect the rear gate lock actuator harness connector.
- 2) Connect the battery to rear gate lock actuator terminals.

Terminal No.	Actuator operation
No. 2 (+) and No. 1 (-)	Unlocked → Locked
No. 1 (+) and No. 2 (-)	Locked → Unlocked

Replace the rear gate latch assembly if faulty.

- 3) Check the cable of rear gate handle for deformation.
- 4) Check the lever and cable of rear gate handle for smooth operation.

15. Trunk Lid Lock Assembly

A: REMOVAL

- 1) Remove the trunk lid release handle. <Ref. to SL-44, REMOVAL, TrunkLid Release Handle.>
- 2) Disconnect the connectors and detach the cable of trunk opener.
- 3) Remove the two bolts to remove trunk lid lock assembly.

B: INSTALLATION

Install in the reverse order of removal.

NOTE:

- Apply grease to the movable part.
- Make sure the lock works correctly after installation.

C: INSPECTION

- 1) Disconnect the trunk lid actuator harness connector.
- 2) Connect the battery to trunk lid actuator terminals.

Terminal No.	Actuator operation
No. 2 (+) and No. 1 (-)	Locked → Unlocked

If defective, replace the trunk lid actuator.

- 3) Check the striker for deformation or abnormal wear.
- 4) Check the safety lever for improper movement.
- 5) Check other levers and the spring for rust formation and unsmooth movement.
- 6) Check the cable of trunk opener for smooth operation.

16. TrunkLid Release Handle

A: REMOVAL

1) Remove the cover (A).

2) Remove the trunk lid trim. <Ref. to EI-70, REMOVAL, Trunk Room Trim.>

3) Remove the four clips to remove trunk lid release handle.

B: INSTALLATION

Install in the reverse order of removal.

C: INSPECTION

Make sure the lever works smoothly.

17. Front Hood Lock Assembly

A: REMOVAL

- 1) Open the front hood.
- 2) Remove the bolts, and then detach the front hood lock assembly.
- 3) Remove the cable from lock assembly.

B: INSTALLATION

Install in the reverse order of removal.

NOTE:

- Apply grease to the movable part.
- Make sure the cable works correctly after installation.

C: ADJUSTMENT

Loosen the bolt, and adjust the lock assembly while moving it up and down.

D: INSPECTION

- 1) Check the striker for deformation or abnormal wear.
- 2) Check the safety lever for improper movement.
- 3) Check other levers and the spring for rust formation and unsmooth movement.

18. Remote Openers

A: REMOVAL

1. FRONT HOOD OPENER

- 1) Remove the cable from hood lock.
- 2) Remove the bolt, and then detach the opener lever.

2. TRUNK LID OPENER

- 1) Remove the rear seat. <Ref. to SE-20, REMOVAL, Rear Seat.>
- 2) Remove the center pillar lower trim, side sill cover, rear pillar lower trim and floor mat on the driver's side. Remove the clip holding cable.
- 3) Remove the opener lever (1) and rear cover (2).
- 4) Remove the pin (3) and remove front cover (4).

- 5) Remove the bolt and nut, and remove the pull handle assembly (5).

- (1) Opener lever
- (2) Rear cover
- (3) Pin
- (4) Front Cover
- (5) Pull handle ASSY
- (6) Cable
- (7) Clamp
- (8) Key cylinder

- 6) Remove the cable from pull handle assembly.
- 7) Remove the clamp (7) to remove key cylinder (8).

CAUTION:

Remove the key cylinder with its UNLOCK position.

- 8) Remove the trunk lid lock assembly from trunk lid.

9) Remove the cable from trunk lid lock assembly.

- (1) Trunk lid lock ASSY
- (2) Cable

3. FUEL FILLER FLAP LID OPENER

• Sedan model

<Ref. to SL-46, TRUNK LID OPENER, REMOVAL, Remote Openers.>

• Wagon model

- 1) Remove the rear seat. <Ref. to SE-20, REMOVAL, Rear Seat.>
- 2) Remove the center pillar lower trim, side sill cover, rear pillar lower trim and floor mat on the driver's side. Remove the clip holding cable.
- 3) Remove the bolt and nut, and then detach the pull handle assembly.

- (1) Cover
- (2) Pull handle ASSY
- (3) Cable

- 4) Remove the cable from pull handle assembly.
- 5) Remove the rear quarter trim RH. <Ref. to EI-62, REMOVAL, Rear Quarter Trim.>

6) Rotate the fuel lock inside of the quarter panel to 90° and remove. (Either right or left turn)

B: INSTALLATION

1. FRONT HOOD OPENER

Install in the reverse order of removal.

2. TRUNK LID OPENER

Install in the reverse order of removal.

CAUTION:

Install the key cylinder with its **UNLOCK** position.

3. FUEL FILLER FLAP LID OPENER

Install in the reverse order of removal.

C: INSPECTION

Make sure the front hood, trunk lid and fuel filler flap lid open and close smoothly.

Ignition Key Lock

SECURITY AND LOCKS

19. Ignition Key Lock

A: REPLACEMENT

- 1) Disconnect the ground cable from battery.
- 2) Remove the steering column. <Ref. to PS-17, REMOVAL, Tilt Steering Column.>
- 3) Secure the steering column in a vise. Remove the bolt with a drill.

- 4) Remove the ignition key lock.
- 5) Using a new bolt, tighten the bolts all the way.

B: INSPECTION

- 1) Remove the instrument panel lower panel.
- 2) Remove the lower column cover.
- 3) Unfasten the fixing clip which secures harness, and then disconnect the connector of the ignition switch from body harness.
- 4) Turn the ignition key plate to each position and check the continuity between terminals of ignition connector.

Switch position	Terminal No.	Standard
LOCK	—	—
ACC	No. 3 and No. 4	Less than 1 Ω
ON	No. 3 and No. 1 and No. 4 No. 3 and No. 6	Less than 1 Ω
ST	No. 3 and No. 1 No. 3 and No. 2 and No. 6	Less than 1 Ω

If NG, replace the ignition switch.

20.Key Lock Cylinders

A: REPLACEMENT

- 1) Raise the front door glass to the top position.
- 2) Remove the door trim. <Ref. to EI-48, REMOV-AL, Door Trim.>
- 3) Remove the sealing cover.
- 4) Remove the rod clamp. Remove the bolt. Re-
place the key cylinder (1).

21.Security Control Unit

A: NOTE

The control of security system is carried out in body integrated unit.

B: REMOVAL

<Ref. to SL-54, REMOVAL, Body Integrated Unit.>

C: INSTALLATION

<Ref. to SL-54, INSTALLATION, Body Integrated Unit.>

22. Impact Sensor

A: REMOVAL

- 1) Remove the key from ignition switch.
- 2) Close all the doors, trunk lid and rear gate.
- 3) Press the UNLOCK button of transmitter.
- 4) Change the setting of impact sensor using Subaru Select Monitor.
- 5) Disconnect the ground cable from battery.
- 6) Remove the impact sensor.

B: INSTALLATION

- 1) Remove the key from ignition switch.
- 2) Close all the doors, trunk lid and rear gate.
- 3) Press the UNLOCK button of transmitter.
- 4) Disconnect the ground cable from battery.
- 5) Install the impact sensor.
- 6) Connect the ground cable from battery.
- 7) Change the setting of impact sensor using Subaru Select Monitor.

C: OPERATION

1. IMPACT SENSOR SETTING USING SUBARU SELECT MONITOR

- 1) Connect the Subaru Select Monitor to data link connector.
- 2) Turn the ignition switch to ON.
- 3) Select {Body Integrated Unit} from the main menu.
- 4) Select {ECM customizing}.
- 5) Make a impact monitor setting.
 - When installing: ON
 - When removing: OFF
- 6) Make a impact monitor ON/OFF setting.
 - When installing: ON
 - When removing: OFF
- 7) Turn the ignition switch to OFF, and then remove the Subaru Select Monitor.

D: ADJUSTMENT

1. CHECK IMPACT SENSOR

- 1) Remove the key from ignition switch.
- 2) Close all the windows.
- 3) Close all the doors, trunk lid and rear gate. Leave open the front hood.
- 4) Press the LOCK button of transmitter from outside of vehicle.
- 5) Check that the security indicator light blinks twice within 0.5 seconds in 2 seconds cycle after 30 seconds.
- 6) Hit the windshield with your palm continuously and check the security alarm operates. Lift up the front hood approx. 12 cm (4.7 in), and then drop it off to check the operation of security alarm.
- 7) If NG, adjust the impact sensitivity.

2. IMPACT SENSITIVITY ADJUSTMENT

- 1) Connect the Subaru Select Monitor to data link connector.
- 2) Turn the ignition switch to ON.
- 3) Select {Impact Sensor} from the main menu.
- 4) Make a {Sensitivity Adjustment Mode}.
 - Sensitivity can be adjusted in 11 levels (0 to 10).
 - Initial setting is 5.
 - Smaller number means more sensitive.
 - Larger number means less sensitive.
- 5) Turn the ignition switch to OFF, and then remove the Subaru Select Monitor.

NOTE:

- Set the sensor so as not to let the alarm on normal vibration (reclining to the door, hit the ball and etc.).
- Set the sensor to operate the alarm with hitting the door or window glass, etc. continuously like a mayhem by robbery.
- Ask the customer about parking situation for setting, because the alarm operate when the vibration not only the burglar but also the construction, etc.

23. Keyless Entry Control Unit

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Remove the glove box. <Ref. to EI-51, REMOVAL, Glove Box.>
- 3) Remove the screw, then remove the keyless entry control module while disconnecting the connector.

B: INSTALLATION

Install in the reverse order of removal.

24. Keyless Buzzer

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Remove the front bumper. <Ref. to EI-30, REMOVAL, Front Bumper.>
- 3) Remove the keyless buzzer installed to the backside of horn bracket.

B: INSTALLATION

Install in the reverse order of removal.

C: INSPECTION

Install the keyless buzzer to another vehicle which operates keyless buzzer normally, check the buzzer sounds.

25. Body Integrated Unit

A: REMOVAL

NOTE:

- If replacing the body integrated unit, check the current setting and note it. <Ref. to LAN(diag)-17, CONFIRMATION OF CURRENT SETTING, OPERATION, Subaru Select Monitor.>
- When replacing the body integrated unit, all immobilizer keys also must be replaced and registered again.

- 1) Disconnect the ground cable from battery.
- 2) Remove the instrument panel lower cover. <Ref. to EI-50, REMOVAL, Instrument Panel Lower Cover.>
- 3) Disconnect the connector of body integrated unit.

CAUTION:

Be careful to keep water and other foreign materials away from body integrated unit.

- 4) Remove the body integrated unit from the body integrated unit mounting bracket using flat tip screwdriver.

CAUTION:

Be careful not to damage the unit when removing it forcibly from the bracket.

- 5) Remove the clutch pedal stopper arm. (MT model) <Ref. to CL-21, REMOVAL, Clutch Pedal.>
- 6) Remove two body integrated unit bracket mounting bolts, and remove the bracket.

B: INSTALLATION

Install in the reverse order of removal.

NOTE:

- When the same body integrated unit is reinstalled in the same vehicle, it is not necessary to register the immobilizer again.
- Make sure it conforms to the current setting condition after installation. <Ref. to LAN(diag)-17, CONFIRMATION OF CURRENT SETTING, OPERATION, Subaru Select Monitor.>

26. Transmitter

A: REMOVAL

1. TRANSMITTER BATTERY

Remove the battery (1) from transmitter.

NOTE:

To prevent static electricity damage to the transmitter printed circuit board, touch the steel area of building with hand to discharge static electricity carried on body or clothes before disassembling the transmitter.

B: INSTALLATION

1. TRANSMITTER BATTERY

Install in the reverse order of removal.

C: INSPECTION

1. TRANSMITTER BATTERY

Measure the voltage between the transmitter battery (+) terminal and (-) terminal.

NOTE:

Battery discharge occurs during the measurement. Complete the measurement within 5 seconds.

(A) Resistance 47 Ω

Tester connection		Standard
(+)	(-)	
Battery Positive terminal	Battery Ground terminal	2.5 — 3.0 V

If NG, replace the battery. (Use CR2025 or equivalent.)

D: REPLACEMENT

1. REGISTRATION OF TRANSMITTER WITH SUBARU SELECT MONITOR

NOTE:

- A maximum of four transmitter can be registered for each individual vehicle.
- When replacing or adding the transmitter, new registration of transmitter is necessary.

- 1) Connect the Subaru Select Monitor to vehicle.
- 2) Turn the ignition switch to ON.
- 3) From the «Main menu» on the Subaru Select Monitor, select the {2. Check individual system} → {7. Integrated unit mode} → {8. Transmitter ID registration}, and press the [YES] key.
- 4) Input the 8-digit ID number from the left attached to the plastic bag of transmitter.

NOTE:

Press the [▲] key on the Subaru Select Monitor to increase the number, and the [▼] key to decrease. Press the [<] key to move to the digit in the left, and [>] to the right.

- 5) The ID number you have entered will be shown. Make sure that the ID number shown is the same as that of plastic bag.
- 6) Press the [YES] key if the ID number is correct. Press the [NO] key if incorrect, to return to the step 3) and try again.
- 7) «ID registration in process...» will be displayed and registration started.
- 8) «ID registration done» will be shown when the process is done.
- 9) To end, select the «END:NO», and press the [NO] key to return to {8. Transmitter ID registration}. If there are additional transmitters to be registered, select the «Next registration:YES», and press the [YES] key to return to the step 3).

NOTE:

- If the registration fails, «ID registration failed. Try again.» will be shown. Press the [YES] key to return to the {8. Transmitter ID registration} and retry from the step 2).
- «END: NO» is shown on the Subaru Select Monitor when four transmitters have been registered. Press the [NO] key to return to {8. Transmitter ID registration}.

27. Immobilizer Control Unit

A: NOTE

The control of immobilizer system is carried out in body integrated unit.

B: REMOVAL

<Ref. to SL-54, REMOVAL, Body Integrated Unit.>

C: INSTALLATION

Install in the reverse order of removal.

28. Immobilizer Antenna

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Remove the screws, and detach the upper column cover and lower column cover.

- 3) Remove the instrument panel lower cover. <Ref. to EI-50, REMOVAL, Instrument Panel Lower Cover.>
- 4) Disconnect the immobilizer antenna connector (A) and ignition switch lighting connector (B).
- 5) Loosen the screw and release the lock (D) at opposite side using flat-tip screwdriver (1), and then detach the immobilizer antenna (C).

CAUTION:

Do not apply excessive force to remove the immobilizer antenna and lock. Otherwise they may be broken because those parts are the products made of a plastic.

B: INSTALLATION

Install in the reverse order of removal.

Immobilizer Antenna

SECURITY AND LOCKS

General Description

SUN ROOF/T-TOP/CONVERTIBLE TOP (SUNROOF)

1. General Description

A: COMPONENT

1. SEDAN MODEL

- | | |
|--------------------------------|---------------------------------|
| (1) Glass lid | (7) Assist rail bracket (Front) |
| (2) Weatherstrip | (8) Sunroof bracket (Rear) |
| (3) Cover | (9) Motor ASSY |
| (4) Sunshade | (10) Frame ASSY |
| (5) Drain tube | (11) Deflector |
| (6) Assist rail bracket (Rear) | |

Tightening torque: N·m (kgf·m, ft·lb)

T1: 4.5 (0.46, 3.3)

T2: 6.0 (0.61, 4.4)

T3: 7.5 (0.76, 5.3)

General Description

SUN ROOF/T-TOP/CONVERTIBLE TOP (SUNROOF)

2. WAGON MODEL

- | | |
|-----------------------|----------------------------|
| (1) Glass lid (Front) | (5) Drain tube |
| (2) Glass lid (Rear) | (6) Cover (Front and rear) |
| (3) Sunshade | (7) Frame bracket |
| (4) Frame ASSY | (8) Motor ASSY |

Tightening torque: N·m (kgf·m, ft·lb)

T1: 7.5 (0.76, 5.3)

T2: 4.5 (0.46, 3.0)

B: CAUTION

- Before disassembling or reassembling parts, always disconnect the battery ground cable. When replacing the audio, control unit, and other parts provided with memory functions, record the memory contents before disconnecting the battery ground cable in order to prevent memory deletion.
- Reassemble the parts in the reverse order of disassembly unless otherwise indicated.
- Adjust parts to the given specifications.
- Connect the connectors securely for reassembly.

- After reassembly, make sure functional parts operate smoothly.

C: PREPARATION TOOL

1. GENERAL TOOL

TOOL NAME	REMARKS
Circuit tester	Used for measuring resistance and voltage.

Sunroof Control System

SUN ROOF/T-TOP/CONVERTIBLE TOP (SUNROOF)

2. Sunroof Control System

A: WIRING DIAGRAM

1. SUNROOF

<Ref. to WI-180, WIRING DIAGRAM, Sunroof Control System.>

B: INSPECTION

Symptom	Inspection order
Water leakage	(1) Check roof panel and glass lid for improper or poor sealing. (2) Check drain tube for clogging. (3) Check sunroof frame seal and body for improper fit.
Booming noise, wind noise and other noise	(1) Check glass lid and roof panel for improper clearance. (2) Check sunshade and roof trim for improper clearance.
Motor noise	(1) Check installing part of motor for looseness. (2) Check gears and bearings for wear. (3) Check cable for wear. (4) Check cable pipe for deformities.
Failure of sunroof (Motor operates properly.)	(1) Check guide rail for foreign particles. (2) Check guide rail for improper installation. (3) Check parts for mutual interference. (4) Check cable slider for improper clinching. (5) Check cable for improper installation.
Motor does not rotate or rotate improperly.	(1) Check fuse for blown out. (2) Check switch for improper function. (3) Check motor for incorrect terminal voltage. (4) Check the relay for improper operation. (5) Check poor grounding system. (6) Check harness for open or short and terminals for poor connections.
Failure turn of glass lid	Check guide rail for foreign particles.

- Failure turn of glass lid while driving rough road.

Glass lid has auto-reverse function. When applied above specified force to the glass lid, the lid turns back and stops. When operating the glass lid (open or close) while driving the rough road, the lid judges vibration as a force and may causes failure turns. When the failure turn is occurred, the initialize operation is required with following procedure.

1. INITIALIZE OPERATION (SEDAN MODEL)

- 1) Tilt up the glass lid.
- 2) Release the switch once, and press the tilt up switch again for 15 seconds.
- 3) When the glass lid is raised a little and returned to tilt up position, release the switch for the moment. (Initialization of position detecting function)
- 4) Keep pressing the tilt up switch within 5 seconds from releasing the switch, glass lid tilts down → slides open → slides close operation automatically. (Time gap of more than 5 seconds will result in cancellation of position detecting function.)
- 5) Initialize operation is completed.

2. INITIALIZE OPERATION (WAGON MODEL)

- 1) Apply the force to glass lid in the direction of glass lid open while glass lid (rear) is closing, and then reverse the lid five times in a row.

However, in the following situation, the initialize operation is canceled.

- When the lid is fully closed once during auto-reverse operation five times in a row.
 - When the interval of auto-reverse operation is more than 30 seconds once.
- 2) When the operation of glass lid shift to brink operation*, fully close the lid on switch operation.
 - 3) Initialize operation is completed.

*Brink operation: Although keep pressing the switch, glass lid operates only at a moment when the switch is pressed.

Glass Lid

SUN ROOF/T-TOP/CONVERTIBLE TOP (SUNROOF)

3. Glass Lid

A: REMOVAL

1. SEDAN MODEL

- 1) Completely close the glass lid, and then open the sunshade.
- 2) Remove the cover (A), and then remove the TORX® bolts (B).

CAUTION:
TORX® bolts are applied with thread locker. If they are removed, replace with new ones.

- 3) Remove the glass lid carefully.

2. WAGON MODEL (FRONT)

- 1) Open the sunshade.

- 2) Pull out the cover (A) toward arrow mark, and then remove the nuts (B).

- 3) Remove the glass lid (front) carefully.

3. WAGON MODEL (REAR)

- 1) Tilt up the glass lid (front), and then open the sunshade.
- 2) Remove the cover (A), and then remove the nuts (B).

- 3) Remove the glass lid carefully.

Glass Lid

SUN ROOF/T-TOP/CONVERTIBLE TOP (SUNROOF)

B: INSTALLATION

Install in the reverse order of removal.

C: ADJUSTMENT

1. SEDAN MODEL

Loosen the glass lid mounting TORX® bolts (A), and then adjust the height with moving the lid.

Difference in height between glass lid and roof panel L:

$2.0 \pm 1.0 \text{ mm (} 0.079 \pm 0.039 \text{ in)}$

2. WAGON MODEL

Loosen the glass lid installation nuts, and then adjust the height by adding (max: four pieces) or extracting (min: zero piece) shims (B) (standard: two pieces) which installed between glass lid (A) and body.

Difference in height between glass lid and roof panel L:

$2.0 \pm 1.0 \text{ mm (} 0.079 \pm 0.039 \text{ in)}$

D: FORCED DRIVE

If glass lid dose not operate or is not supplied with power, move the glass lid using the emergency handle (hexagon wrench)*.

*: Emergency handle (L shape general purpose hexagon wrench)

Sedan model: bolt width 4 mm (0.16 in)

Wagon model: bolt width 5 mm (0.20 in)

1. SEDAN MODEL

- 1) Remove the spot map light. <Ref. to LI-29, REMOVAL, Spot Map Light.>
- 2) Insert the hexagon wrench securely until it touches the motor shaft edge.
- 3) Turn the hexagon wrench, and move the glass lid.
 - Turning right, the glass lid open.
 - Turning left, the glass lid close.

2. WAGON MODEL

1) Slide the slider (A) to vehicle rearward (C), and remove the sun shade from slider by raising the rod (B).

CAUTION:

Be careful not to damage the adjacent parts with rod end when moving the glass lid with emergency handle.

2) Slide the sunshade forward.
3) Remove the plug in the rear side of roof trim.

4) Insert the hexagon wrench securely until it touches the motor shaft edge.
5) Turn the hexagon wrench to right, and close the glass lid (front and rear).

CAUTION:

After forced drive, the initialize operation is required. <Ref. to SR-4, INSPECTION, Sunroof Control System.>

Sunroof Assembly

SUN ROOF/T-TOP/CONVERTIBLE TOP (SUNROOF)

4. Sunroof Assembly

A: REMOVAL

1. SEDAN MODEL

- 1) Disconnect the ground cable from battery.
- 2) Remove the roof trim. <Ref. to EI-66, SEDAN MODEL, REMOVAL, Roof Trim.>
- 3) Disconnect the harness connector of sunroof motor.
- 4) Remove the glass lid. <Ref. to SR-5, SEDAN MODEL, REMOVAL, Glass Lid.>
- 5) Remove the drain tube from frame assembly.
- 6) Remove the assist rail bracket (front) (A) and sunroof bracket (rear) (B).

- 7) Remove the nuts, and then remove the frame assembly.

2. WAGON MODEL

- 1) Disconnect the ground cable from battery.
- 2) Remove the roof trim. <Ref. to EI-66, WAGON MODEL, REMOVAL, Roof Trim.>

- 3) Disconnect the harness connector of motor assembly.

- 4) Remove the front and rear glass lid. <Ref. to SR-5, WAGON MODEL (FRONT), REMOVAL, Glass Lid.> <Ref. to SR-5, WAGON MODEL (REAR), REMOVAL, Glass Lid.>
- 5) Remove the installation bolts (A) on rear side frame bracket of frame assembly.

- 6) Remove the drain tube from frame assembly.
- 7) Remove the frame bracket (A).

Sunroof Assembly

SUN ROOF/T-TOP/CONVERTIBLE TOP (SUNROOF)

8) Remove the bolts (B) and nuts (C), and then remove the frame assembly.

SR-00082

B: INSTALLATION

Install in the reverse order of removal.

CAUTION:

Be careful not to snag the harness.

NOTE:

- Be sure to connect the harness connector.
- When installing the drain tube, insert it securely into drain pipe.

Length A:

15 mm (0.59 in) or more

SR-00005

C: DISASSEMBLY

- 1) Remove the sunroof motor. <Ref. to SR-10, REMOVAL, Sunroof Motor.>
- 2) Remove the sunshade. <Ref. to SR-15, REMOVAL, Sunshade.>

D: ASSEMBLY

Assemble in the reverse order of disassembly.

Sunroof Motor

SUN ROOF/T-TOP/CONVERTIBLE TOP (SUNROOF)

5. Sunroof Motor

A: REMOVAL

CAUTION:

- When removing the clip, use great care not to damage the roof trim.
- Never rotate the sunroof motor after removing it.

1. SEDAN MODEL

- 1) Completely close the glass lid.
- 2) Disconnect the ground cable from battery.
- 3) Remove the spot map light. <Ref. to LI-29, REMOVAL, Spot Map Light.>
- 4) Disconnect the harness connector, and then remove the motor assembly mounting screw.

CAUTION:

When removing the motor assembly, secure the cable wires to prevent moves.

2. WAGON MODEL

- 1) Fully close the glass lid (front) and glass lid (rear).
- 2) Disconnect the ground cable from battery.
- 3) Remove the luggage room light. <Ref. to LI-31, REMOVAL, Luggage Room Light.>
- 4) Remove the roof trim. <Ref. to EI-66, WAGON MODEL, REMOVAL, Roof Trim.>
- 5) Pass the seat belt tongue located on center of rear seat through the hole, and then pull it out to the opposite side of trim.

- (A) Tongue
- (B) Cover

6) Remove the clips, and then drop the rear end of roof trim.

7) Disconnect the harness connector (A), and then remove the motor assembly mounting bolts (B) and nuts (C).

B: INSTALLATION

CAUTION:

When installing the motor assembly, be careful not to move the sunroof cable.

Sunroof Motor

SUN ROOF/T-TOP/CONVERTIBLE TOP (SUNROOF)

1. SEDAN MODEL

1) Align the coulisse assembly and link assembly in the same position.

- (1) Front
- (2) Coulisse ASSY
- (3) Link ASSY
- (4) 4.7 mm (0.185 in)

2) Install the motor assembly.

3) Connect the harness connector of motor assembly, and then connect the battery ground cable to battery.

4) Perform the initialize operation of motor.

(1) Tilt up the glass lid.

(2) Release the switch once, and press the tilt up switch again for 15 seconds.

(3) When the glass lid is raised a little and on tilt up position, release the switch for the moment.

(4) Keep pressing the tilt up switch within 5 seconds from releasing the switch, glass lid tilts down → slides open → slides close operation automatically, and then initialize operation is completed.

5) Check the operation of sunroof with following table.

Operation	Switch position
(1) Glass lid closes completely.	Close
(2) Glass lid tilt up to the top position.	Tilt up
(3) Glass lid lowers completely.	Tilt down
(4) Glass lid opens completely.	Open
(5) Glass lid closes 150 mm (5.91 in) away from completely closed position.	Close
(6) Glass lid closes completely.	Close

6) Install the trim in the reverse order of removal.

Sunroof Motor

SUN ROOF/T-TOP/CONVERTIBLE TOP (SUNROOF)

2. WAGON MODEL

Check that the wedge of glass lid (front) bracket part is contacting in the direction of vehicle front. At this time, the lid is at fully open position.

- (1) Front
- (2) Wedge
- (3) Glass lid (Front)
- (4) Glass lid (Rear)

1) Install the motor assembly.

2) After the installation of motor assembly, check again that the wedge of glass lid (front) bracket part is contacting in the direction of vehicle front.

3) Connect the harness connector of motor assembly, and then connect the battery ground cable to battery.

4) Perform the initialize operation of motor.

- When replacing the motor with a new one, fully close the glass once and perform the initialization of position, because the movement of glass lid shifts to brink operation.
- When reusing the motor, operate the auto-reverse function five times in a row to shifts brink operation, and then perform the initialization of position.

5) Check the operation of sunroof with following table.

Operation	Switch position
(1) Glass lid (front) and glass lid (rear) closes completely.	Close
(2) Glass lid (front) tilt up to the ventilating position.	Open
(3) Glass lid (front) tilts up to top position, and glass lid (rear) opens near the completely open position.	Open
(4) Glass lid (rear) opens completely.	Open
(5) Glass lid (rear) closes on 150 mm (5.91 in) from rear end of tilted up glass lid (front).	Close
(6) Glass lid (rear) closes completely, and glass lid (front) stops in the ventilating position.	Close
(7) Glass lid (front) lowers, and then glass lid (front) and glass lid (rear) closes completely.	Close

6) Install the trim in the reverse order of removal.

Sunroof Switch

SUN ROOF/T-TOP/CONVERTIBLE TOP (SUNROOF)

6. Sunroof Switch

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Remove the spot map light lens (A) and sunroof switch mounting screws (B).

- 3) Disconnect the harness connector, and then remove the sunroof switch.

B: INSTALLATION

Install in the reverse order of removal.

C: INSPECTION

1. SEDAN MODEL

Measure the sunroof switch resistance.

Switch position	Terminal No.	Standard	Connector No.
Open	1 and 3	Less than 1 Ω	R128
Close	3 and 4	Less than 1 Ω	
Tilt up	4 and 3	Less than 1 Ω	R187
Tilt down	3 and 4	Less than 1 Ω	

2. WAGON MODEL

Measure the sunroof switch resistance.

Switch position	Terminal No.	Standard
Open	1 and 3	Less than 1 Ω
Close	3 and 4	Less than 1 Ω

Sunroof Switch

SUN ROOF/T-TOP/CONVERTIBLE TOP (SUNROOF)

NOTE:

If glass lid does not operate or is not supplied with power, move the glass lid using the emergency handle. <Ref. to SR-6, FORCED DRIVE, Glass Lid.>

Sunshade

SUN ROOF/T-TOP/CONVERTIBLE TOP (SUNROOF)

7. Sunshade

A: REMOVAL

1. SEDAN MODEL

- 1) Remove the glass lid. <Ref. to SR-5, SEDAN MODEL, REMOVAL, Glass Lid.>
- 2) Loosen the TORX® bolts, and remove sunshade bracket (front).

- 3) Pull out the sunshade until sunshade bracket (rear) is shown, loosen the TORX® bolts, and remove sunshade.

2. WAGON MODEL

- 1) Remove the frame assembly.
- 2) Remove the shade stopper (A) of sunshade.

- 3) Pull out the sunshade (A) from sunroof frame.

B: INSTALLATION

Install in the reverse order of removal.

C: INSPECTION

1. CHECK FOR MOVING LOAD OF SUNSHADE

1) Attach a spring balance to sunshade edge using a cloth.

2) Pull the spring balance to measure moving load of the sunshade.

Moving load of sunshade:

Specification

18.0±5.0 N (1.8±0.5 kgf, 13±3.7 lbf)

NOTE:

Moving load is larger at the beginning of pulling a spring balance, so take a spring balance reading while sunshade sliding smoothly.

3) If moving load exceeds specifications, check the glass lid, sunshade and frame assembly for improper installation.

B: PREPARATION TOOL

TOOL NAME	REMARKS
Clip remover	Used for removal of trim.
Clip clamp pliers	Used for removal of various clips and clamps.

2. Front Grille

A: REMOVAL

- 1) Open the hood.
- 2) Remove the push clips (A), front grille clips (B) and bolt (C) from each side of front grille.

- 3) Pull lower side of the front grille forward, remove hooks (A), and then remove the front grille from vehicle body.

B: INSTALLATION

Install in the reverse order of removal.

3. Front Hood Grille

A: REMOVAL

- 1) Open the front hood.
- 2) Remove the front hood insulator. <Ref. to EB-13, FRONT HOOD INSULATOR, REMOVAL, Front Hood.>
- 3) Remove the screws (A) and clip (B), and remove the front hood duct.

- 4) Loosen the nuts (A), remove the clip (B), and then remove the front hood grille.

B: INSTALLATION

- 1) Fit the clip (B) of front hood grille, and install the front hood grille using nuts (A).

- 2) Insert the hooks (B) of the front hood duct into holes (A) of the front hood.

- 3) Install the front hood duct with the screws (A) and clip (B).

Tightening torque:
4.5 N·m (0.46 kgf·m, 3.32 ft·lb)

4. Front Under Cover

A: REMOVAL

- 1) Lift-up the vehicle.
- 2) Remove the clips (A) in front fender and bolts (B), and then remove the front under cover.

- Large type

- Small type

B: INSTALLATION

Install in the reverse order of removal.

Tightening torque:

14 N·m (1.42 kgf·m, 10.3 ft·lb)

5. Floor Under Protector

A: REMOVAL

1) Lift-up the vehicle.

NOTE:

Plate type lift can not be used.

2) Remove the push turn clips (A) and bolts (B), and remove the floor under protector.

B: INSTALLATION

Install in the reverse order of removal.

6. Fuel Tank Protector

A: REMOVAL

- 1) Lift-up the vehicle.
- 2) Remove the bolts (A) and plastic nuts (B), and then remove the fuel tank protector.

B: INSTALLATION

Install in the reverse order of removal.

Tightening torque:

Bolt

17.5 N·m (1.78 kgf-m, 12.9 ft-lb)

7. Mud Guard

A: REMOVAL

1. FRONT MUD GUARD

- 1) Jack-up the vehicle.
- 2) Remove the front wheels.
- 3) Loosen the screws and clips to remove mud guard.

2. REAR MUD GUARD

- 1) Jack-up the vehicle.
- 2) Remove the rear wheels.
- 3) Loosen the screws and clips to remove mud guard.

B: INSTALLATION

1. FRONT MUD GUARD

Install in the reverse order of removal.

2. REAR MUD GUARD

Install in the reverse order of removal.

8. Front Bumper

A: REMOVAL

1. FRONT BUMPER FACE

- 1) Disconnect the ground cable from battery.
- 2) Remove the front grille. <Ref. to EI-24, REMOVAL, Front Grille.>
- 3) Turn over the front mud guard, and remove the clips connecting the fender and bumper.

- 4) Remove the clips at the lower side of bumper.

- 5) Disconnect the fog light connector. (Model with fog light)
- 6) Remove the bumper from vehicle body.
- 7) Remove the fog light from bumper face. <Ref. to LI-17, REMOVAL, Front Fog Light Assembly.>

2. FRONT BUMPER BEAM ASSEMBLY

- 1) Disconnect the ground cable from battery.
- 2) Remove the front grille. <Ref. to EI-24, REMOVAL, Front Grille.>

- 3) Remove the front bumper face. <Ref. to EI-30, FRONT BUMPER FACE, REMOVAL, Front Bumper.>
- 4) Remove the energy absorber foam from bumper beam.
- 5) Remove the upper bracket.

- 6) Remove the bolts, and remove the bumper beam assembly from vehicle body.

NOTE:

After all bolts are removed, raise the whole bumper beam a little to remove it from vehicle body.

- 7) Remove the bolts and nuts, and disassemble the bumper beam.

- 8) Remove the under cover.

- 9) Remove the bolts and clips, and remove the radiator guide.

B: INSTALLATION

1. FRONT BUMPER FACE

- 1) Install in the reverse order of removal.
- 2) Fit the slider (A) to the guide plate (B) securely.

2. FRONT BUMPER BEAM ASSEMBLY

Install in the reverse order of removal.

Tightening torque:

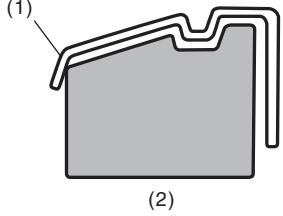

Refer to "COMPONENT" of "General Description". <Ref. to EI-5, FRONT BUMPER, COMPONENT, General Description.>

Front Bumper

EXTERIOR/INTERIOR TRIM

C: REPAIR

1. COATING METHOD FOR PP BUMPER

Process No.	Process name	Job contents	
1	Bumper installation	Place the bumper on a paint worktable as required. Use the paint worktable conforming to inner shape of bumper when possible.	 <p>(1) Bumper (2) Set bumper section</p> <p style="text-align: right;">EI-00234</p>
2	Masking	Mask specified part (black base) with masking tape. Use masking tape for PP (example, Nichiban No. 533, etc.).	
3	Degreasing, cleaning	Clean all parts to be painted with white gasoline, normal alcohol, etc. to remove dirt, oil, fat, etc.	
4	Primer paint	Apply primer to all parts to be painted, using spray gun. Use primer (clear).	
5	Drying	Dry at normal temperature [10 — 15 min. at 20°C (68°F)]. In half-dried condition, PP primer paint is dissolved by solvent, e.g. thinner, etc. Therefore, if dust or dirt must be removed, use ordinary alcohol, etc.	
6	Top coat paint (I)	Non-colored	Metallic paint
		Use section (block) paint for top coat. • Paint to be used (for each color): Solid paint Hardener PB Thinner T-301 • Mixing ratio: Main agent vs. hardener = 4:1 • Viscosity: 10 — 13 sec./20°C (68°F) • Film thickness: 35 — 45 μ • Spraying pressure: 245 — 343 kPa (2.5 — 3.5 kg/cm ² , 36 — 50 psi)	Use section (block) paint for top coat. • Paint to be used (for each color): Metallic paint Hardener PB Thinner T-306 • Mixing ratio: Main agent vs. hardener = 10:1 • Viscosity: 10 — 13 sec./20°C (68°F) • Film thickness: 15 — 20 μ • Spraying pressure: 245 — 343 kPa (2.5 — 3.5 kg/cm ² , 36 — 50 psi)
7	Drying	Not required.	Dry at normal temperature [more than 10 min. at 20°C (68°F)]. In half-dried condition, avoid dust, dirt.
8	Top coat paint (II)	Not required.	Apply a clear coat to parts with top coat paint (I), three times, at 5 — 7 minutes intervals. • Paint to be used: Metallic paint Hardener PB Thinner T-301 • Mixing ratio: Clear coat vs. hardener = 6:1 • Viscosity: 14 — 16 sec./20°C (68°F) • Film thickness: 25 — 30 μ • Spraying pressure: 245 — 343 kPa (2.5 — 3.5 kg/cm ² , 36 — 50 psi)
9	Drying	60°C (140°F), 60 min. or 80°C (176°F), 30 min. If higher than 80°C (176°F), PP may be deformed. Keep maximum temperature at 80°C (176°F).	
10	Inspection	Paint check.	
11	Masking removal	Remove masking tape applied in process No. 2.	

2. REPAIR INSTRUCTIONS FOR COLORED PP BUMPER

NOTE:

All PP bumpers are provided with a grained surface, and if the surface is damaged, it cannot normally be restored to its former condition. Damages limited to the shallow scratches that cause only a change in the luster of the base material or coating, can be almost fully restored. Before repairing a damaged area, explain this point to the customer and obtain an understanding about the matter. Repair methods are outlined below, based on a classification of the extent of damage.

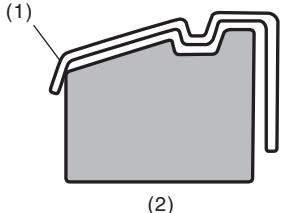

1) Minor damage causing only a change in the lustre of the bumper due to a light touch
Almost restorable.

Process No.	Process name	Job contents	
1	Cleaning	Clean the area to be repaired using water.	
2	Sanding	Grind the repairing area with #500 sand paper in a "feathering" motion.	
3	Finish	Resin section	Coated section
		Repeatedly apply wax to the affected area using a soft cloth (such as flannel). Recommended wax: NITTO KASEI Soft 99 TIRE WAX BLACK, or equivalent.	
		Polish the waxed area with a clean cloth after 5 to 10 minutes.	Perform either the same process as for the resin section or process No. 18 and subsequent in the "3" section, depending on the degree and nature of damage.

2) Deep damage caused by scratching with fences, etc.
A dent cannot be repaired but a whitened or swelled part can be removed.

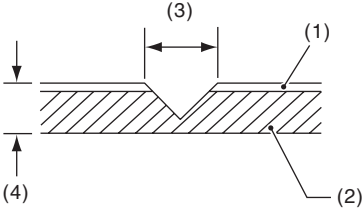

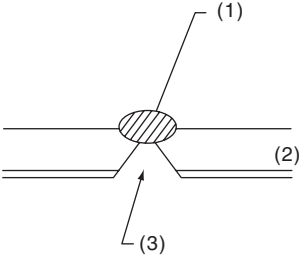

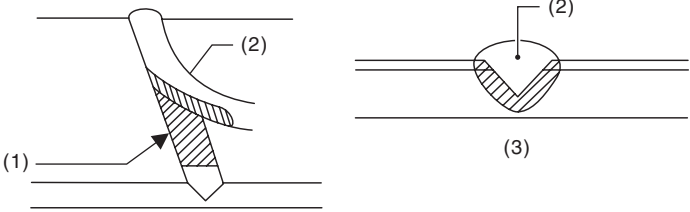

Process No.	Process name	Job contents	
1	Cleaning	Clean damaged area with water.	
2	Removal of damaged area	Cut off protruding area, if any, due to collision, using a putty knife.	
3	Sanding	Grind the affected area with #100 to #500 sand paper.	
4	Finish	Resin section	Coated section
		Same as Process No. 3 in the "1" section.	Perform Process No. 12 and subsequent operations in the "3" section.

3) Deep damage such as a break or hole that requires filling
Much of the peripheral grained surface must be sacrificed for repair. The degree of restoration is not really worth the expense. (The surface, however, will become almost flush with adjacent areas.)
Recommended repair kit: PP Part Repair Kit (NRM)

Process No.	Process name	Job contents	
1	Bumper removal	Remove the bumper as required.	
2	Removal of parts	Remove the parts built into bumper as required.	
3	Bumper placement	Place the bumper on a paint worktable as required. It is recommended to use the paint worktable conforming to internal shape of bumper.	 <p style="text-align: right;">EI-00234</p>
4	Surface preparation	Remove dust, oil, etc. from areas to be repaired and surrounding areas, using a suitable solvent (NRM No. 900 Precleno, white gasoline, or alcohol, etc.).	

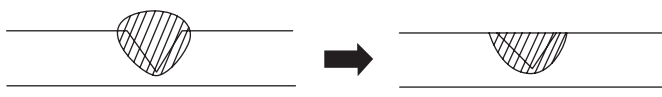

Front Bumper

EXTERIOR/INTERIOR TRIM

Process No.	Process name	Job contents	
5	Cutting	<p>If nature of damage are cracks or holes, cut a guide slit of 20 to 30 mm (0.79 to 1.18 in) in length along the crack or hole up to the bumper's base surface. Then, bevel or "vee-out" the affected area using a knife or grinder.</p>	 <p style="text-align: right;">EI-00235</p> <p>(1) Paint surface (2) PP base surface (3) 20 — 30 mm (0.79 — 1.18 in) (4) 3 mm (0.12 in)</p>
6	Sanding (I)	Grind beveled surface with sand paper (#40 to #60) to smooth finish.	
7	Cleaning	Clean the sanded surface with the same solvent as used in Process No. 4.	
8	Temporary welding	<p>Grind the side just opposite the beveled area with sand paper (#40 to #60) and clean using a solvent. Temporarily spot-weld the side, using a PP welding rod and heater gun.</p>	 <p style="text-align: right;">EI-00236</p> <p>(1) Welded point (Use heater gun and PP welding rod) (2) PP base surface (3) Beveled section</p> <p>NOTE:</p> <ul style="list-style-type: none"> Do not melt welding rod until it flows out. This results in reduced strength. Leave the welded spot unattended until it cools completely.
9	Welding	<p>Using a heater gun and PP welding rod, weld the beveled spot while melting the rod and damaged area.</p>	 <p style="text-align: right;">EI-00237</p> <p>(1) Welding rod (2) Melt hatched area (3) Section</p> <p>NOTE:</p> <ul style="list-style-type: none"> Melt the sections indicated by hatched area. Do not melt the welding rod until it flows out, in order to provide strength. Always keep the heater gun 1 to 2 cm (0.4 to 0.8 in) away from the welding spot. Leave the welded spot unattended until it cools completely.

Front Bumper

EXTERIOR/INTERIOR TRIM

Process No.	Process name	Job contents	
10	Sanding (II)	Remove excess part of weld with a putty knife. If a drill or disc wheel is used instead of the knife, operate it at a rate lower than 1,500 rpm and grind the excess part little by little. A higher rpm will cause the PP substrate to melt from the heat.	
			
		EI-00042	
11	Masking	Mask the black substrate section using masking tape. Recommended masking tape: Nichiban No. 533 or equivalent	
12	Cleaning/ degreasing	Completely clean the entire coated area, using solvent similar to that used in Process No. 4.	
13	Primer coating	Apply a coat of primer to the repaired surface and its surrounding areas. Mask these areas, if necessary. Recommended primer: Mp/ 364 PP Primer NOTE: Be sure to apply coat of primer at a spraying pressure of 245 — 343 kPa (2.5 — 3.5 kg/cm ² , 36 — 50 psi) with a spray gun.	
14	Leave unattended	Leave the repaired area unattended at 20°C (68°F) for 10 to 15 minutes until primer is half-dry. NOTE: If dirt or dust comes in contact with the coated area, wipe it off with a cloth with alcohol. (Do not use thinner since the coated area tends to melt.)	
15	Primer surfacer coating	Apply a coat of primer surfacer to the repaired area two or three times at an interval of 3 to 5 minutes. Recommended surfacer: <ul style="list-style-type: none"> • UPS 300 Flex Primer • No. 303 UPS 300 Exclusive hardener • NPS 725 Exclusive Reducer (thinner) • Mixing ratio: 2 : 1 (UPS 300 : No. 303) • Viscosity: 12 — 14 sec./20°C (68°F) • Coating film thickness: 40 — 50 μ 	
16	Drying	Allow the coated surface to dry for 20 minutes at 20°C (68°F) [or 30 minutes at 60°C (140°F)].	
17	Sanding (III)	Sand the coated surface and its surrounding areas using #400 sand paper and water.	
18	Cleaning/ degreasing	Same as Process No. 12.	
19	Top coat (I)	Non-colored	Metallic paint
		Use a “block” coating method. <ul style="list-style-type: none"> • Recommended paint: Suncryl (SC) No. 307 Flex Hardener SC Reducer (thinner) • Mixing ratio: Suncryl (SC) vs. No. 307 Flex Hardener = 3 : 1 • Viscosity: 11 — 13 sec./20°C (68°F) • Coating film thickness: 40 — 50 μ • Spraying pressure: 245 — 343 kPa (2.5 — 3.5 kg/cm², 36 — 50 psi) 	Use a “block” coating method. <ul style="list-style-type: none"> • Recommended paint: Suncryl (SC) No. 307 Flex Hardener SC Reducer (thinner) • Mixing ratio: Suncryl (SC) vs. No. 307 Flex Hardener = 3 : 1 • Viscosity: 11 — 13 sec./20°C (68°F) • Coating film thickness: 20 — 30 μ • Spraying pressure: 245 — 343 kPa (2.5 — 3.5 kg/cm², 36 — 50 psi)

Front Bumper

EXTERIOR/INTERIOR TRIM

Process No.	Process name	Job contents	
20	Leave unattended	Not required.	Leave unattended at 20°C (68°F) for at least 10 minutes until the topcoated area is half-dry. NOTE: Be careful to keep dust or dirt from coming in contact with the affected area.
21	Top coat (II)	Not required.	Apply a clear coat three times at an interval of 3 to 5 minutes. • Recommended paint: SC710 Overlay Clear No. 307 Flex Hardener SC Reducer (thinner) • Mixing ratio: Suncryl (SC) vs. No. 307 Flex Hardener = 3 : 1 • Viscosity: 10 — 13 sec./20°C (68°F) • Coating film thickness: 20 — 30 μ • Spraying pressure: 245 — 343 kPa (2.5 — 3.5 kg/cm ² , 36 — 50 psi)
22	Drying	Allow the coated surface to dry for 2 hours at 20°C (68°F) or 30 minutes at 60°C (140°F). NOTE: Do not allow the temperature to exceed 80°C (176°F) since this will deform the PP substrate.	
23	Inspection	Carefully check the condition of the repaired area.	
24	Masking removal	Remove the masking tape applied in Process No. 11 and 13.	
25	Parts installation	Install parts on the bumper in reverse order of removal.	
26	Bumper installation	Install the bumper.	

9. Rear Bumper

A: REMOVAL

1. REAR BUMPER FACE

- 1) Disconnect the ground cable from battery.
- 2) Remove the rear combination light assembly.
<Ref. to LI-20, REMOVAL, Rear Combination Light Assembly.>
- 3) Remove the two clips.

- 4) Turn over the mud guard, and remove the bolt (A) inside wheel house, and the clips (B) on the lower side of bumper.

- 5) Remove the clips on the lower side of rear bumper.

- 6) Remove the service hole cover, and remove the bolt.

- Sedan model: trunk side trim

- Wagon model: rear quarter lower trim

NOTE:

For model with woofer, remove the woofer cover.

- 7) Remove the rear bumper from vehicle body.

NOTE:

- Do not pull with a excessive force. Otherwise the bracket installation area may be damaged.
- When removing the bumper face from bracket, it is easier to remove from the end in order.

Rear Bumper

EXTERIOR/INTERIOR TRIM

2. REAR BUMPER BRACKET

- 1) Remove the rear bumper face from vehicle body.
- 2) Remove the rear bumper bracket corner from vehicle body. (both sides)

- 3) Remove the lower brackets from vehicle body.
- Sedan model: 2 places

- Wagon model: 4 places

3. REAR BUMPER BEAM ASSEMBLY

- 1) Disconnect the ground cable from battery.
- 2) Remove the rear bumper face. <Ref. to EI-37, REAR BUMPER FACE, REMOVAL, Rear Bumper.>
- 3) Remove the energy absorber foam.

- 4) Remove the nuts, and remove the beam main reinforcement from vehicle body.

- 5) Remove the nuts, and remove the bumper beam bracket and beam upper rear from vehicle body.

B: INSTALLATION

1. REAR BUMPER FACE

- 1) Install the beam upper rear to vehicle body.
- 2) Install the bumper face to vehicle body.

NOTE:

If the bumper face is easily come off the beam upper rear, adjust the hook area of the bracket side.

- 3) Install in the reverse order of removal.

Tightening torque:

Refer to "COMPONENT" of "General Description".

<Ref. to EI-6, REAR BUMPER (SEDAN MODEL), COMPONENT, General Description.>

2. REAR BUMPER BRACKET

Install in the reverse order of removal.

3. REAR BUMPER BEAM ASSEMBLY

Install in the reverse order of removal.

C: REPAIR

Refer to the description for front bumper repair. <Ref. to EI-30, REMOVAL, Front Bumper.>

10.Cowl Panel

A: REMOVAL

- 1) Open the hood.
- 2) Remove the wiper arm. <Ref. to WW-14, REMOVAL, Front Wiper Arm.>
- 3) Remove the weather strip clip, and remove the weather strip.

NOTE:

If the weather strip clip is removed with excessive force, the weather strip may be damaged. Be sure to use a clip remover to remove.

- 4) Remove the clip, and remove the cover cowl panel.

- 5) Remove the cowl panel side and clip (A).

- 6) Remove the clips (A), and remove the cowl panel.

B: INSTALLATION

Install in the reverse order of removal.

11. Roof Spoiler

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Remove the rear gate trim. <Ref. to EI-68, REMOVAL, Rear Gate Trim.>
- 3) Disconnect the connector of the high mounted stop light and the washer hose of rear washer.
- 4) Remove the nut and plastic caps.

- 5) Remove the clips, and remove the roof spoiler.

B: INSTALLATION

Install in the reverse order of removal.

Tightening torque:

4.5 N·m (0.46 kgf·m, 3.32 ft·lb)

12.Side Sill Spoiler

A: REMOVAL

Remove the clips (two for front fender arch area, six for side sill spoiler lower area), and remove the side spoiler.

- (1) Side sill spoiler
- (2) Double-sided tape

- (3) End cover

- (4) Clip

- (A) Gray clip

- (B) Green clip

- (C) Black clip

NOTE:

When peel the double sided tape, reference to removal procedure of side protector. <Ref. to EI-43, REMOVAL, Side Protector.>

Side Sill Spoiler

EXTERIOR/INTERIOR TRIM

B: INSTALLATION

Install in the reverse order of removal.

NOTE:

For the rearmost clip securing side sill spoiler, install through the end cover.

- (1) Vehicle body
- (2) End cover
- (3) Side sill spoiler

13.Side Protector

A: REMOVAL

EI-01084

(1) Front door protector

(2) Rear door protector

(A) White clip

1) Slide in a thin thread (A) of 0.8 mm (0.031 in) diameter or less (fishing line etc.) between body and protector, cut the double-sided tape, and pull the protector toward you, and remove the clip using clip remover.

- If the double-sided tape remains thick on the surface due to interfacial peeling, apply the solvent after slicing off the double-sided tape using a cutter.

EI-00153

EI-00478

(A) Panel

(B) Side protector

(C) Double-sided tape

NOTE:

- To optimize the effect of solvent, slide the thread along body without removing the double-sided tape on the surface of body and spoiler.
- If it is difficult to detach the double-sided tape, warm up to approx. 40°C (104°F).

- 2) Apply masking tape around the double-sided tape remaining on the surface of body or spoiler.
- 3) Apply solvent uniformly on double-sided tape using a brush.

CAUTION:

- Do not use the solvent to the body which is repaired with lacquer paint.
- Wipe off immediately when the solvent is touched on surface of the body or spoiler.

Solvent:

3M 8907 or equivalent

Side Protector

EXTERIOR/INTERIOR TRIM

4) Cover the area where solvent is applied using plastic wrap (A), and then heat the double-sided tape for 5 to 10 minutes in 40 — 60°C (104 — 140°F) using a heat lamp (B).

Double-sided tape:

3M 5531-5 or equivalent

2) Heat the adhering part using a heat lamp.

Body side: 40 — 60°C (104 — 140°F)

Protector side: 20 — 30°C (68 — 86°F)

3) Detach the double-sided tape backing sheet, align the clip position, and then adhere to the body using care to avoid air entering.

CAUTION:

To keep the adhesion, do not wash the vehicle within 24 hours from installation.

CAUTION:

Do not heat the double-sided tape until the surface becomes white and excessively dried.

5) Remove the double-sided tape using a plastic spatula.

6) After completely removing the double-sided tape, detach the masking tape and clean the surface using a cotton cloth damped with white gasoline.

B: INSTALLATION

1) Apply primer to the protector surface where the double-sided tape to be adhered, and then adhere the double-sided tape as shown in the figure.

(1) Double-sided tape: thickness 1.2 mm (0.047 in), width 5mm (0.197 in)

Primer:

3M K-500 or equivalent

14.Side Garnish

A: REMOVAL

(A) Black clip
(B) White clip

(C) Pink clip
(D) Gray clip

(E) Green clip

- 1) Remove the side sill spoiler. <Ref. to EI-41, REMOVAL, Side Sill Spoiler.>
- 2) For removal of side garnish, refer to the removal procedure of "Side Protector". <Ref. to EI-43, REMOVAL, Side Protector.>

B: INSTALLATION

Check the color of clip, and then install in the reverse order of removal.

15.Rear Quarter Protector

A: REMOVAL

- 1) Remove the side sill spoilers. <Ref. to EI-41, REMOVAL, Side Sill Spoiler.>
- 2) Remove the clips (A) with rotating it rearward using the fender arch as a fulcrum, and then remove the rear quarter protector.

B: INSTALLATION

Install in the reverse order of removal.

16. Roof Rail

A: REMOVAL

- 1) Remove the roof trim. <Ref. to EI-66, REMOVAL, Roof Trim.>
- 2) Remove the six nuts.

EI-01086

NOTE:

Perform the removing procedures by referring to above illustration. (OUTBACK model)

B: INSTALLATION

Install in the reverse order of removal.

CAUTION:

When removing or installing the roof rail, be careful not to scratch the body panel with the stud bolt of roof rail.

Tightening torque:

7.5 N·m (0.76 kgf-m, 5.53 ft-lb)

17. Door Trim

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Remove the cover (A) at inner remote area.

- 3) Push the root of hand grip up ward, and remove the hand grip cover by twisting it to the vehicle forward direction.

LH side: Counterclockwise
RH side: Clockwise

NOTE:

If the above procedure does not work, use a flat-tip screw driver to pry out the upper side of hand grip cover to remove, with the protection tape attached to both door trim and flat-tip screwdriver.

- 4) Loosen the screws.

- 5) Remove the clips, and disconnect each connector and wire to remove door trim.

- Front door trim

- Rear door trim

B: INSTALLATION

Install in the reverse order of removal.

NOTE:

Be careful not to install the hand grip cover and plate clip of hand grip in the wrong direction.

- Hand grip cover (front and rear door)

Convex upward

- Bottom clip of the front door faces the opposite direction

- Lower side of the hand grip cover for front door has pawl part.
- The lowest clip of rear door faces the opposite direction

18. Instrument Panel Lower Cover

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Remove the front door inside scuff plate (A) and front pillar lower trim (B). <Ref. to EI-60, REMOVAL, Lower Inner Trim.>

- 3) Remove the clips, and remove the instrument panel lower cover under.

- 4) Loosen the screw (A), disconnect the connectors, and remove the instrument panel lower cover upper.

(B) Clip

B: INSTALLATION

Install in the reverse order of removal.

19. Glove Box

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Remove the console box. <Ref. to EI-53, REMOVAL, Console Box.>
- 3) Remove the console front panel.

(A) Hook

NOTE:

For AT model, remove the ring indicator.
For MT model, remove the shift knob.

- 4) Remove the console side garnish.

(A) Hook

- 5) Remove the front inside scuff plate (A) and front pillar lower trim (B). <Ref. to EI-60, REMOVAL, Lower Inner Trim.>

- 6) Remove the clip, and remove the glove box lower cover.

- 7) Remove the console side panel.

- 8) Remove the instrument panel side cover, and remove the clip.

(A) Clip

- 9) Remove the screw, and remove the glove box.

(A) Clip

B: INSTALLATION

Install in the reverse order of removal.

20. Console Box

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Remove the parking brake lever cover.

- 3) Remove the bolts and clips.

- 4) Disconnect the connector, and remove the console box.

B: INSTALLATION

Install in the reverse order of removal.

21.Center Console

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Remove the console box. <Ref. to EI-53, REMOVAL, Console Box.>
- 3) Remove the console front panel.

(A) Hook

NOTE:

For AT model, remove the ring indicator.
For MT model, remove the shift knob.

- 4) Loosen the screw, remove the hook, and remove the console side garnish.

(A) Hook

- 5) Remove the instrument panel lower cover. <Ref. to EI-50, REMOVAL, Instrument Panel Lower Cover.>

- 6) Remove the clip at the console side panel tip.

- 7) Remove the passenger side front inside scuff plate (A) and front pillar lower trim (B). <Ref. to EI-60, REMOVAL, Lower Inner Trim.>

- 8) Remove the clip, and remove the glove box lower cover.

9) Remove the screws, and remove the console side panel.

10) Loosen the screws to pull out the audio unit assembly, and disconnect the connector to remove audio unit.

NOTE:
Audio unit assembly can be removed without removing the console side panel.

B: INSTALLATION

Install in the reverse order of removal.

Instrument Panel Assembly

EXTERIOR/INTERIOR TRIM

22. Instrument Panel Assembly

A: REMOVAL

1. INSTRUMENT PANEL (EXCLUDING STEERING SUPPORT BEAM)

CAUTION:

Be careful to the harness of airbag system when servicing the instrument panel. Damage may cause the system malfunction.

- 1) Disconnect the ground cable from battery.
- 2) Remove the front pillar upper trim. <Ref. to EI-61, REMOVAL, Upper Inner Trim.>
- 3) Remove the console box. <Ref. to EI-53, REMOVAL, Console Box.>
- 4) Remove the center console. <Ref. to EI-54, REMOVAL, Center Console.>
- 5) Remove the instrument panel lower cover. <Ref. to EI-50, REMOVAL, Instrument Panel Lower Cover.>
- 6) Remove the glove box. <Ref. to EI-51, REMOVAL, Glove Box.>
- 7) Remove the combination meter assembly. <Ref. to IDI-15, REMOVAL, Combination Meter.>
- 8) Remove the screws.

- 9) Remove the driver side instrument panel side cover, and remove the screws.

- 10) Remove the screw at the side of center console.

- 11) Remove the center air vent grille of instrument panel. <Ref. to AC-46, CENTER GRILLE, REMOVAL, Air Vent Grille.>
- 12) Remove the screws.

- 13) Remove the screws at side of passenger side instrument panel.

- 14) Remove the bolts securing passenger side airbag module to the steering support beam.

15) Disconnect the connectors, and remove the instrument panel from vehicle body.

NOTE:

- If necessary, make matching marks for easy re-assembly.
- When storing the removed instrument panel, be sure to prepare a table or the like to put instrument panel on to prevent damage.

16) Remove the side air vent grille. <Ref. to AC-46, REMOVAL, Air Vent Grille.>

17) Remove the heater vent duct. <Ref. to AC-48, REMOVAL, Heater Vent Duct.>

18) Loosen the screws to remove center console frame.

19) Loosen the screws to remove meter bracket.

20) Loosen the screws to remove instrument panel matching pins.

21) Loosen the screws to remove glove box striker.

22) Remove the pawl, and remove the passenger's airbag module.

2. STEERING SUPPORT BEAM

1) Remove the instrument panel. <Ref. to EI-56, INSTRUMENT PANEL (EXCLUDING STEERING SUPPORT BEAM), REMOVAL, Instrument Panel Assembly.>

2) Remove the steering shaft assembly. <Ref. to PS-17, REMOVAL, Tilt Steering Column.>

3) Remove each harness clip, and remove the harness from steering support beam.

NOTE:

If necessary, make matching marks for easy reassembly.

4) Remove the bolt and remove steering support beam.

Instrument Panel Assembly

EXTERIOR/INTERIOR TRIM

5) Remove the steering support beam bracket.

3. INSTRUMENT PANEL ASSEMBLY (INCLUDING STEERING SUPPORT BEAM)

CAUTION:

Be careful to the harness of airbag system when servicing the instrument panel. Damage may cause the system malfunction.

- 1) Remove the front pillar upper trim. <Ref. to EI-61, REMOVAL, Upper Inner Trim.>
- 2) Remove the center console. <Ref. to EI-54, REMOVAL, Center Console.>
- 3) Remove the instrument panel lower cover. <Ref. to EI-50, REMOVAL, Instrument Panel Lower Cover.>
- 4) Remove the glove box. <Ref. to EI-51, REMOVAL, Glove Box.>
- 5) Remove the steering shaft assembly. <Ref. to PS-17, REMOVAL, Tilt Steering Column.>
- 6) Remove the driver side instrument panel side cover, and remove the bolts.

7) Remove the bolts at the side of passenger side instrument panel.

8) Loosen the bolts on the center console side.

9) Disconnect each connector, and remove the instrument assembly.

NOTE:

If necessary, make matching marks for easy reassembly.

B: INSTALLATION

1. INSTRUMENT PANEL (EXCLUDING STEERING SUPPORT BEAM)

1) Insert the matching pins (3 places) on the instrument panel tip into the grommet (A) and (B) on the body panel side.

- 2) Check the inserted state of matching pins, and pull the harness around.
- 3) Tighten the instrument panel with screw, and recheck the installation of instrument panel and the state of pulled harness.
- 4) Install in the reverse order of removal.

NOTE:

How to install the insulator and pad:

- Adhesive

Use polyurethane adhesive. Also connect the instrument panel after evaporating during assembly, since the smell may permeate the compartment.

- Double-side tape

Use generic double-side tape. Use double-sided adhesive tape having extra-strength.

- Installing position

(1) 10 mm

(2) 40 mm

Make clearance for 10 mm from instrument panel front edge, and 40 mm from both side edges when taping.

2. STEERING SUPPORT BEAM

- 1) Temporarily tighten the steering support beam with bolt, and pull the harness around.
- 2) Make sure that there is no mutual interference in each pedal, and tighten the each bolt.

Tightening torque:

25 N·m (25.5 kgf·m, 18 ft·lb)

- 3) Install in the reverse order of removal.

3. INSTRUMENT PANEL ASSEMBLY (INCLUDING STEERING SUPPORT BEAM)

- 1) Insert the matching pins (3 places) on the instrument panel tip into the grommet (A) and (B) on the body panel side.

- 2) Check the inserted state of matching pins, and pull the harness around.
- 3) Temporarily tighten the steering support beam with bolt, and pull the harness around.
- 4) Make sure that there is no mutual interference in each pedal, and tighten the each bolt.

Tightening torque:

25 N·m (25.5 kgf·m, 18 ft·lb)

- 5) Install in the reverse order of removal.

Lower Inner Trim

EXTERIOR/INTERIOR TRIM

23. Lower Inner Trim

A: REMOVAL

1) Remove the hook, and remove the inside scuff plate.

(A) Hook

2) Remove the door molding (A), and remove the outside scuff plate.

(B) Clip

3) Remove the clip (A), and remove the front pillar lower trim.

4) Remove the rear seat cushion. <Ref. to SE-20, REMOVAL, Rear Seat.>

5) Remove the clip (A), and remove the inside scuff plate.

(B) Hook

6) Remove the door molding (A) and door catcher cover (B), and then remove the outside scuff plate.

(C) Hook with plate clip

(D) Clip

7) Remove the clips of the center pillar lower trim.

B: INSTALLATION

Install in the reverse order of removal.

24.Upper Inner Trim

A: REMOVAL

1) From the top side of trim, remove the metal clip using flat tip driver.

CAUTION:
When metal clip is removed or damaged, replace the both of trim and metal clip with new ones.

2) Remove the front pillar upper trim.

3) Remove the front inside scuff plate, rear inside scuff plate and center pillar lower trim. <Ref. to EI-60, REMOVAL, Lower Inner Trim.>

4) Remove the cap on the upper side of pillar trim, and remove the bolt inside.

5) Remove the center pillar upper trim.

6) Remove the seat belt lower anchor bolt at center pillar lower port. (Driver's seat)

7) Refer to the removal procedure of "Front Seat Belt". (Passenger's seat). <Ref. to SB-10, OUTER SEAT BELT ASSEMBLY, REMOVAL, Front Seat Belt.>

B: INSTALLATION

Install in the reverse order of removal.

Rear Quarter Trim

EXTERIOR/INTERIOR TRIM

25. Rear Quarter Trim

A: REMOVAL

1. SEDAN MODEL

- 1) Remove the rear seat. <Ref. to SE-20, SEDAN MODEL, REMOVAL, Rear Seat.>
- 2) Turn over the trim, and remove the quarter trim rear by pressing the claw (A) of metal clip using flat tip screwdriver or the like.

(B) Hook

CAUTION:

When metal clip is removed or damaged, replace the bolt of trim and metal clip with new ones.

- 3) Remove the cap on the upper side of trim, and remove the bolt inside.

- 4) Remove the bolts (A), and remove the quarter trim (front).

2. WAGON MODEL

- 1) Remove the rear seat cushion and backrest shoulder. <Ref. to SE-20, WAGON MODEL, REMOVAL, Rear Seat.>
- 2) Remove the cap on the upper side of pillar trim, and remove the bolt inside.

- 3) Remove the clip, and remove the quarter front pillar trim.

- 4) Remove the quarter rear pillar trim.

5) Remove the luggage floor box. <Ref. to EI-73, REMOVAL, Luggage Floor Box.>

6) Remove the luggage floor end cover.

7) Remove the woofer cover. (Model with woofer)

8) Remove the screws (A) and bolts (B), and remove the quarter lower trim.

NOTE:

- Remove the screw cover on the tonneau cover installing part.
- Pull out the shopping bag hook, remove the screw on back.

B: INSTALLATION

1. SEDAN MODEL

Install in the reverse order of removal.

2. WAGON MODEL

Install in the reverse order of removal.

26.Sun Visor

A: REMOVAL

1) Remove the cover, loosen the mounting screws, and remove the sun visor.

2) Disconnect the connector. (Model with vanity mirror light)

3) Press the (A) on both side using flat tip driver, pull the sun visor hook and remove it.

B: INSTALLATION

Install in the reverse order of removal.

27. Assist Grip

A: REMOVAL

- 1) Remove the screw cover, and remove the screw inside.
- 2) Pull the left side of assist grip toward you, and rotate the right side of it counterclockwise to remove.

- 3) Remove the roof trim. <Ref. to EI-66, REMOVAL, Roof Trim.>
- 4) Remove the bolts, and remove the assist grip bracket.

(A) Grommet

B: INSTALLATION

Install in the reverse order of removal.

CAUTION:

Be sure to install the grommet to assist grip bracket.

When install the assist grip without grommet, it may cause the faulty returning.

28. Roof Trim

A: REMOVAL

1. SEDAN MODEL

- 1) Disconnect the ground cable from battery.
- 2) Remove the front seats. <Ref. to SE-9, REMOVAL, Front Seat.>
- 3) Remove the rear seat. <Ref. to SE-20, REMOVAL, Rear Seat.>
- 4) Remove the console box. <Ref. to EI-53, REMOVAL, Console Box.>
- 5) Remove the center console. <Ref. to EI-54, REMOVAL, Center Console.>
- 6) Remove the select lever. (AT model)
<Ref. to CS-20, REMOVAL, Select Lever.>
- 7) Remove the spot map light. <Ref. to LI-29, REMOVAL, Spot Map Light.>
- 8) Remove the room light. <Ref. to LI-30, REMOVAL, Room Light.>
- 9) Remove the sun visor. <Ref. to EI-64, REMOVAL, Sun Visor.>
- 10) Remove the assist grip. <Ref. to EI-65, REMOVAL, Assist Grip.>
- 11) Remove the upper inner trim. <Ref. to EI-61, REMOVAL, Upper Inner Trim.>
- 12) Remove the rear quarter trim. <Ref. to EI-62, SEDAN MODEL, REMOVAL, Rear Quarter Trim.>
- 13) Remove the sunroof opening trim. (Model with sunroof)

- 14) Remove the clips and each harness, and remove the roof trim.
- 15) Pull out the roof trim from vehicle.

2. WAGON MODEL

- 1) Disconnect the ground cable from battery.
- 2) Remove the spot map light. <Ref. to LI-29, REMOVAL, Spot Map Light.>
- 3) Remove the room light. <Ref. to LI-30, REMOVAL, Room Light.>
- 4) Remove the luggage room light. <Ref. to LI-31, REMOVAL, Luggage Room Light.>
- 5) Remove the sun visor. <Ref. to EI-64, REMOVAL, Sun Visor.>
- 6) Remove the assist grip. <Ref. to EI-65, REMOVAL, Assist Grip.>
- 7) Remove the upper inner trim. <Ref. to EI-61, REMOVAL, Upper Inner Trim.>
- 8) Remove the rear quarter trim. <Ref. to EI-62, WAGON MODEL, REMOVAL, Rear Quarter Trim.>

CAUTION:

Do not remove the roof end trim with excessive force. Otherwise roof trim may be damaged. Roof trim and roof end trim are fastened by rivets.

- 9) Remove the sunroof opening trim. (Model with sunroof)

- 10) Remove the clips and each harness, pull out the rear center seat belt, and remove the roof trim.

CAUTION:

Do not remove the roof end trim with excessive force. Otherwise roof trim may be damaged.

B: INSTALLATION

1. SEDAN MODEL

Install in the reverse order of removal.

2. WAGON MODEL

Install in the reverse order of removal.

Rear Gate Trim

EXTERIOR/INTERIOR TRIM

29.Rear Gate Trim

A: REMOVAL

1) Remove the clips (A), and remove the rear gate pillar trim.

2) Remove the clips, and detach the rear gate upper trim.

3) Remove the cover in the inner handle, loosen the inside screw.

4) Turn over the weather strip, and remove the clips.

5) Remove the clips (A), remove the rear gate lower trim.

6) Remove the rear gate weather strip.

NOTE:

If the weather strip clip is removed with excessive force, the weather strip may be damaged. Be sure to use a clip remover to remove.

B: INSTALLATION

Install in the reverse order of removal.

30.Rear Shelf Trim

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Remove the rear quarter trim. <Ref. to EI-62, SEDAN MODEL, REMOVAL, Rear Quarter Trim.>
- 3) Remove the high-mounted stop light. <Ref. to LI-28, REMOVAL, High-mounted Stop Light.>
- 4) Remove the rear seat cushion. <Ref. to SE-20, WAGON MODEL, REMOVAL, Rear Seat.>
- 5) Remove the lower anchor bolt of rear center seat belt.

- 6) After disconnecting the high-mounted stop light harness connector (A) and removing the five clips, remove the rear shelf trim with pulling it forward.

B: INSTALLATION

Install in the reverse order of removal.

NOTE:

Securely insert the vehicle body panel into the hook of rear shelf trim center, and then install the rear shelf trim.

- (1) Hook
- (2) Rear shelf trim
- (3) Vehicle body panel

Trunk Room Trim

EXTERIOR/INTERIOR TRIM

31. Trunk Room Trim

A: REMOVAL

1. TRUNK LID TRIM

1) Remove the trim clips and stopper rubbers, and remove the trunk lid trim.

2) Remove the four pawls, and then remove trunk handle cover (1).

- (1) Trunk handle cover
- (2) Trunk lid trim
- (3) Trunk release handle

3) Remove the clip (A) of trunk side trim, and then remove the trunk lid arm cover.

2. TRUNK ROOM TRIM

1) Remove the trunk room mat.

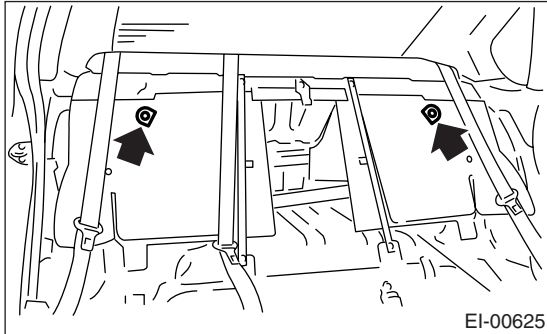

2) Remove the trim clips (A), and remove the trunk room end cover.

(B) Clip

3) Remove the rear seat backrest, and then remove the trim clips at the front side of trunk side trim. <Ref. to SE-20, WAGON MODEL, REMOVAL, Rear Seat.>

4) Insert the flat tip driver from the lower side of trunk hook, and then remove the trunk hook with rotating it 90°.

5) Remove the trim clips, and remove the trunk side trim.

B: INSTALLATION

1. TRUNK LID TRIM

Install in the reverse order of removal.

2. TRUNK ROOM TRIM

Install in the reverse order of removal.

32.Floor Mat

A: REMOVAL

- 1) Remove the front seats. <Ref. to SE-9, REMOVAL, Front Seat.>
- 2) Remove the rear seat cushion. <Ref. to SE-20, REMOVAL, Rear Seat.>
- 3) Remove the console box. <Ref. to EI-53, Console Box.>
- 4) Remove the console side panel. <Ref. to EI-54, REMOVAL, Center Console.>
- 5) Remove the lower inner trim. <Ref. to EI-60, REMOVAL, Lower Inner Trim.>
- 6) Remove the footrest. (MT model)
- 7) Remove the clips from floor mat.
- 8) Remove the mat hook on both side.
- 9) Remove the mat from toe board area.
- 10) Remove the mat from rear heater duct.
- 11) Roll the mat, and then take it out of opened rear door.

B: INSTALLATION

Install in the reverse order of removal.

NOTE:

- Secure the mat firmly with hook and clip.
- Insert the mat edge firmly into the groove of side sill cover.

33.Luggage Floor Box

A: REMOVAL

- 1) Remove the luggage floor mat.
- 2) Remove the clips, and remove the luggage floor box.

B: INSTALLATION

Install in the reverse order of removal.

34. Trunk Lid Garnish

A: REMOVAL

1) Remove the license plate, loosen the bolts (A).

2) Remove the clip in the upper corner of trunk lid garnish.

3) Remove the trunk lid garnish in the order from the end of it, by accessing it through the gap between trunk lid garnish and trunk lid panel.

B: INSTALLATION

Install in the reverse order of removal.

Tightening torque:

7.5 N·m (0.77 kgf-m, 5.53 ft-lb)

35.Rear Gate Garnish

A: REMOVAL

- 1) Remove the rear gate trim. <Ref. to EI-68, REMOVAL, Rear Gate Trim.>
- 2) Remove the clip (A), and remove the rear gate panel side cover.

- 3) Remove the hexagon cap nut.

- 4) Remove the nuts, disconnect each connector, and remove the rear gate garnish.

B: INSTALLATION

Install in the reverse order of removal.

36.Heat Shield Cover

A: REMOVAL

1. FRONT HEAT SHIELD COVER

Remove the four bolts to remove front heat shield cover.

(A) Transmission mount

2. CENTER HEAT SHIELD COVER

Remove the nut and bolt to remove center heat shield cover.

3. REAR HEAT SHIELD COVER

1) Remove the muffler. <Ref. to EX(H4SO)-10, REMOVAL, Muffler.> <Ref. to EX(H4DOTC)-13, REMOVAL, Muffler.>

2) Remove the four bolts to remove rear heat shield cover.

B: INSTALLATION

Install in the reverse order of removal.

37.Ornament

A: INSTALLATION

1. LETTER MARK

Adhere the letter mark with following dimension.

- Sedan model

- | | | |
|---|--|--|
| (a) Apply the apply tape with aligning the cut out to the end of trunk lid garnish. | (b) Apply the apply tape with aligning R stop on the top end of trunk lid garnish. | (c) Align the slit of apply tape to panel end. |
| (1) Letter mark | (2) Apply tape | (3) Rear combination light |

T2: 14 (1.43, 10.3)

T3: 25 (2.6, 18.4)

C: CAUTION

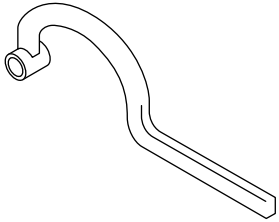

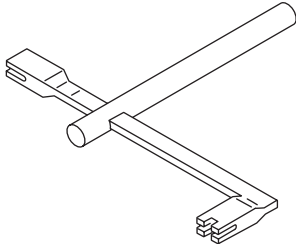

- Exterior body panels are heavy. Do not drop and damage the panels. During removal and installation, do not damage the panel painting surface.
- While removing mounting bolts, using assistance devices such as a support jack will help to support the panel.
- Be careful not to lose small parts.

General Description

EXTERIOR BODY PANELS

D: PREPARATION TOOL

1. SPECIAL TOOL

ILLUSTRATION	TOOL NUMBER	DESCRIPTION	REMARKS
 <p style="text-align: center;">ST-925610000</p>	925610000	WRENCH	Used for removing and installing door hinge.
 <p style="text-align: center;">ST-927780000</p>	927780000	REMOVER	Used for removing and installing trunk torsion bar.

2. GENERAL TOOL

TOOL NAME	REMARKS
Support jack	Used for supporting door panel.
Clip remover	Used for removing various types of clips.

2. Front Hood

A: REMOVAL

1. FRONT HOOD INSULATOR

- 1) Open the front hood.
- 2) Release the clips to remove front hood insulator.

2. FRONT HOOD WEATHER STRIP

- 1) Open the front hood.
- 2) Remove the clips, and remove the front hood weather strip (A) and intake duct weather strip (B).

- (C) Clip
- (D) Weather strip clip

NOTE:

If the weather strip clip is removed with excessive force, the weather strip may be damaged. Be sure to use clip remover to remove.

3. FRONT HOOD HINGE

- 1) Remove the bolts, and remove the front hood panel. <Ref. to EB-14, FRONT HOOD PANEL, REMOVAL, Front Hood.>

- 2) Remove the clips, and remove the cowl side panel front.

- 3) Remove the clamp (A) of the window washer hose, and remove bolt of the hinge.

Front Hood

EXTERIOR BODY PANELS

4. FRONT HOOD STRIKER

- 1) Open the front hood.
- 2) Remove the bolt, and remove the front hood striker.

5. FRONT HOOD PANEL

- 1) Open the front hood to remove the window washer hose.

- 2) Remove the front hood insulator.
<Ref. to EB-13, FRONT HOOD INSULATOR, REMOVAL, Front Hood.>
- 3) Remove the front hood weather strip.
<Ref. to EB-13, FRONT HOOD WEATHER STRIP, REMOVAL, Front Hood.>
- 4) Remove the front hood striker.
<Ref. to EB-14, FRONT HOOD STRIKER, REMOVAL, Front Hood.>
- 5) Remove the front hood duct. (Turbo model)
<Ref. to EI-25, REMOVAL, Front Hood Grille.>
- 6) Remove the window washer hose and nozzle.
<Ref. to WW-16, REMOVAL, Front Washer Nozzle.>

- 7) Remove the bolts, and remove the front hood panel from front hood hinge.

B: INSTALLATION

1. FRONT HOOD INSULATOR

Install in the reverse order of removal.

NOTE:

Be careful not to catch the window washer hose in.

2. FRONT HOOD WEATHER STRIP

Install in the reverse order of removal.

3. FRONT HOOD HINGE

Install in the reverse order of removal.

Tightening torque:

24.5 N·m (2.5 kgf-m, 18.1 ft-lb)

4. FRONT HOOD STRIKER

Install in the reverse order of removal.

Tightening torque:

33 N·m (3.4 kgf-m, 24.5 ft-lb)

5. FRONT HOOD PANEL

Install in the reverse order of removal.

Tightening torque:

24.5 N·m (2.5 kgf-m, 18.1 ft-lb)

C: ADJUSTMENT

- 1) Adjust the clearance between front hood panel and front fender panel. Clearance must be equal at both sides. For the dimension of clearance, refer to "SPECIFICATION" in "General Description". <Ref. to EB-2, SPECIFICATION, General Description.>

2) Use the hinge mounting bolts to align the front hood longitudinal and lateral position.

3) Adjust the height at the front end of hood. <Ref. to SL-45, ADJUSTMENT, Front Hood Lock Assembly.>

4) Rotate the hood buffer to adjust lateral height.

3. Front Fender

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Remove the side sill spoilers. <Ref. to EI-41, REMOVAL, Side Sill Spoiler.>
- 3) Remove the front grille. <Ref. to EI-24, REMOVAL, Front Grille.>
- 4) Remove the front bumper face. <Ref. to EI-30, REMOVAL, Front Bumper.>
- 5) Remove the headlight assembly. <Ref. to LI-11, REMOVAL, Headlight Assembly.>
- 6) Remove the mud guard. <Ref. to EI-29, REMOVAL, Mud Guard.>
- 7) Remove the cowl panel side.

- 8) Remove the bolt, and remove the front fender panel.

B: INSTALLATION

- 1) Install in the reverse order of removal.
- 2) Install with attention to make uniform clearance between front fender panel and front hood panel. For the dimension of clearance, refer to "SPECIFICATION" in "General Description". <Ref. to EB-2, SPECIFICATION, General Description.>

Tightening torque:

7.4 N·m (0.75 kgf-m, 5.5 ft-lb)

4. Front Door

A: REMOVAL

1. FRONT DOOR PANEL

- 1) Disconnect the ground cable from battery.
- 2) Remove the front door trim. <Ref. to EI-48, REMOVAL, Door Trim.>
- 3) Remove the outer mirror assembly. <Ref. to GW-19, REMOVAL, Outer Mirror Assembly.>
- 4) Remove the front door speaker. <Ref. to ET-6, REMOVAL, Front Speaker.>
- 5) Pull back the sealing cover. <Ref. to EB-20, REMOVAL, Front Sealing Cover.>
- 6) Remove the gusset and front door glass. <Ref. to GW-11, REMOVAL, Front Door Glass.>
- 7) Remove the door sash, and remove the front door regulator and motor. <Ref. to GW-16, REMOVAL, Front Regulator and Motor Assembly.>
- 8) Remove the front door latch assembly. <Ref. to SL-35, REMOVAL, Front Door Latch & Door Lock Actuator Assembly.>
- 9) Remove the front outer handle. <Ref. to SL-34, REMOVAL, Front Outer Handle.>
- 10) Remove the screw to remove door trim bracket.

- 11) Remove the front door weather strip.

- (A) Pin clip
(B) Weather strip clip

NOTE:

If the weather strip clip is removed with excessive force, the weather strip may be damaged. Be sure to use clip remover to remove.

- 12) Remove the bolts and nuts to remove door checker.

- 13) Remove the front door. <Ref. to EB-17, FRONT DOOR ASSEMBLY, REMOVAL, Front Door.>

2. FRONT DOOR ASSEMBLY

- 1) Disconnect the ground cable from battery.
- 2) Remove the front pillar lower trim. <Ref. to EI-60, REMOVAL, Lower Inner Trim.>
- 3) Remove the instrument panel lower cover or glove box lower cover. <Ref. to EI-50, REMOVAL, Instrument Panel Lower Cover.> or <Ref. to EI-51, REMOVAL, Glove Box.>

Front Door

EXTERIOR BODY PANELS

- 4) Disconnect the connector of door harness from body harness.

- 5) Put a wooden block on jack, and place the jack under the front door. Support the door with a jack to protect it from damage.

- 6) Remove the bolt from door checker.

- 7) Remove the door-side bolts for upper and lower hinges to remove front door panel.

- 8) Remove the door hinge from vehicle.

B: INSTALLATION

1. FRONT DOOR PANEL

Install in the reverse order of removal.

Tightening torque:

Refer to "COMPONENT" of "General Description".

<Ref. to EB-8, FRONT DOOR PANEL, COMPONENT, General Description.>

2. FRONT DOOR ASSEMBLY

- 1) Put a wooden block on jack and place the front door on it.

- 2) Apply grease to the sliding area of door hinges, and install the door hinge to vehicle.
- 3) Install the front door to upper hinge and lower hinge adjusting by jack.
- 4) Tighten the bolt of door checker.
- 5) Connect the door harness connector, and install the instrument panel lower cover.
- 6) Install the front pillar lower trim.

Tightening torque:

Refer to "COMPONENT" of "General Description".

<Ref. to EB-8, FRONT DOOR PANEL, COMPONENT, General Description.>

C: ADJUSTMENT

- 1) Using the ST, loosen the body-side bolts of upper and lower hinges to align the front door panel longitudinal and lateral position.

ST 925610000 DOOR HINGE WRENCH

2) Loosen the screws (A), and tap the striker (B) using plastic hammer to adjust the gap between rear end surface of front door panel and front end surface of rear door.

CAUTION:

Do not use an impact wrench. Welding area on the striker nut plate is easily broken.

5. Front Sealing Cover

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Remove the front door trim. <Ref. to EI-48, REMOVAL, Door Trim.>
- 3) Remove the front speaker. <Ref. to ET-6, REMOVAL, Front Speaker.>
- 4) Pull back the sealing cover.

NOTE:

- Carefully remove the butyl tape. Excessive force will easily break the cover.
- If cover is broken, replace it with a new one.

B: INSTALLATION

- 1) Install in the reverse order of removal.
- 2) When replacing the sealing cover, use butyl tape.
- 3) Press the butyl tape-applied area firmly to prevent any floating on surface.

Butyl tape:

3M 8626 or equivalent

NOTE:

- Apply a uniform bead of butyl tape.
- Attach the sealing cover, keeping it from becoming wrinkled.
- Breaks in the bead will allow water leakage and contamination.

C: INSPECTION

If the sealing cover is damaged, replace it with a new one.

6. Rear Door

A: REMOVAL

1. REAR DOOR PANEL

- 1) Disconnect the ground cable from battery.
- 2) Remove the rear door trim. <Ref. to EI-48, REMOVAL, Door Trim.>
- 3) Remove the rear speaker. <Ref. to ET-8, REMOVAL, Rear Speaker.>
- 4) Pull back the sealing cover. <Ref. to EB-24, REMOVAL, Rear Sealing Cover.>
- 5) Remove the rear door glass. <Ref. to GW-24, REMOVAL, Rear Door Glass.>
- 6) Remove the door sash and rear door regulator and motor assembly. <Ref. to GW-26, REMOVAL, Rear Regulator and Motor Assembly.>
- 7) Remove the rear door latch. <Ref. to SL-39, REMOVAL, Rear Door Latch & Door Lock Actuator Assembly.>
- 8) Remove the rear outer handle. <Ref. to SL-38, REMOVAL, Rear Outer Handle.>
- 9) Remove the screw to remove door trim bracket.

- 10) Remove the rear door weather strip.

- (A) Pin clip
(B) Weather strip clip

NOTE:

If the weather strip clip is removed with excessive force, the weather strip may be damaged. Be sure to use clip remover to remove.

- 11) Remove the bolts and nuts to remove door checker.

- 12) Remove the rear door. <Ref. to EB-21, REAR DOOR ASSEMBLY, REMOVAL, Rear Door.>

2. REAR DOOR ASSEMBLY

- 1) Disconnect the ground cable from battery.
- 2) Remove the center pillar lower trim. <Ref. to EI-60, REMOVAL, Lower Inner Trim.>

Rear Door

EXTERIOR BODY PANELS

- 3) Remove the center pillar inner protector lower.

- 4) Remove the harness holder (A), and disconnect the door harness connector inside of pillar.

- 5) Put a wooden block on jack, and place the jack under the rear door. Support the rear door with the jack to protect it from damage.

- 6) Remove the bolt from door checker.

- 7) Remove the door-side bolts for upper and lower hinges to remove the rear door panel.

- 8) Remove the door hinge from vehicle.

B: INSTALLATION

1. REAR DOOR PANEL

Install in the reverse order of removal.

Tightening torque:

Refer to "COMPONENT" of "General Description".

<Ref. to EB-9, REAR DOOR PANEL, COMPONENT, General Description.>

2. REAR DOOR ASSEMBLY

- 1) Put a wooden block on jack, and place the rear door on it.

- 2) Apply grease to sliding area of the door hinges.
3) Install the rear door to upper hinge and lower hinge adjusting by jack.
4) Tighten the bolt of door checker.
5) Connect the door harness connector, and install the center pillar inner protector.
6) Install the center pillar lower trim.

Tightening torque:

Refer to "COMPONENT" of "General Description".

<Ref. to EB-9, REAR DOOR PANEL, COMPONENT, General Description.>

C: ADJUSTMENT

1) Open the rear door, loosen the door-side bolts of upper and lower hinges to align the rear door panel longitudinal and lateral position.

2) Loosen the screws (A), and tap the striker (B) using plastic hammer to adjust the gap between rear end surface of rear door panel and body surface.

CAUTION:

Do not use an impact wrench. Welding area on the striker nut plate is easily broken.

7. Rear Sealing Cover

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Remove the rear door trim. <Ref. to EI-48, REMOVAL, Door Trim.>
- 3) Pull back the sealing cover.

NOTE:

- Carefully remove the butyl tape. Excessive force will easily break the cover.
- If cover is broken, replace it with a new one.

B: INSTALLATION

- 1) Install in the reverse order of removal.
- 2) When replacing the sealing cover, use butyl tape.
- 3) Press the butyl tape-applied area firmly to prevent any floating on surface.

Butyl tape:

3M 8626 or equivalent

NOTE:

- Apply a uniform bead of butyl tape.
- Attach the sealing cover, keeping it from becoming wrinkled.
- Breaks in the bead will allow water leakage and contamination.

C: INSPECTION

If the sealing cover is damaged, replace it with a new one.

8. Trunk Lid

A: REMOVAL

1. TORSION BAR

- 1) Open the trunk lid.
- 2) Using the ST, remove the torsion bar from hinge link.

ST 927780000 REMOVER

CAUTION:

During removal and installation, carefully handle the torsion bar, because it will generate reactive force.

- 3) Remove the torsion bars RH/LH.

2. TRUNK LID ARM

- 1) Disconnect the ground cable from battery.
- 2) Open the trunk lid to remove the trunk lid trim, trunk lid arm cover and trunk room trim. <Ref. to EI-70, TRUNK ROOM TRIM, REMOVAL, Trunk Room Trim.>
- 3) Disconnect the trunk lid release cable. <Ref. to SL-43, REMOVAL, Trunk Lid Lock Assembly.>
- 4) Disconnect each connector, and remove the harness clip, etc.
- 5) Remove the trunk lid mounting bolts to remove the trunk lid panel from trunk lid arm.

- 6) Remove the torsion bar from trunk lid hinge link. <Ref. to EB-25, TORSION BAR, REMOVAL, Trunk Lid.>
- 7) Remove the rear shelf trim. <Ref. to EI-69, REMOVAL, Rear Shelf Trim.>

- 8) Remove the bolts to remove trunk lid arm.

3. TRUNK LID PANEL

- 1) Disconnect the ground cable from battery.
- 2) Open the trunk lid to remove trunk lid trim and trunk lid arm cover. <Ref. to EI-70, TRUNK ROOM TRIM, REMOVAL, Trunk Room Trim.>
- 3) Disconnect the connector to remove trunk lid harness.
- 4) Remove the trunk lid lock assembly. <Ref. to SL-43, REMOVAL, Trunk Lid Lock Assembly.>
- 5) Remove the trunk lid garnish. <Ref. to EI-74, REMOVAL, Trunk Lid Garnish.>
- 6) Remove the license plate light cover.

- 7) Remove the bolts to remove the trunk lid panel from trunk lid arm.

B: INSTALLATION

1. TORSION BAR

- 1) Install in the reverse order of removal.
- 2) Apply grease to the rotating area of hinges and of torsion bar.

2. TRUNK LID ARM

Install in the reverse order of removal.

Tightening torque:

17.6 N·m (1.8 kgf-m, 12.9 ft-lb)

3. TRUNK LID PANEL

1) Install in the reverse order of removal.

2) Install with attention to make uniform clearance around the trunk lid panel. For the dimension of clearance, refer to "SPECIFICATION" in "General Description". <Ref. to EB-2, SPECIFICATION, General Description.>

Tightening torque:

14 N·m (1.43 kgf-m, 10.3 ft-lb)

9. Rear Gate

A: REMOVAL

1. REAR GATE PANEL

- 1) Disconnect the ground cable from battery.
- 2) Open the rear gate.
- 3) Remove the rear gate trim. <Ref. to EI-68, REMOVAL, Rear Gate Trim.>
- 4) Remove the rear gate garnish. <Ref. to EI-75, REMOVAL, Rear Gate Garnish.>
- 5) Remove the rear wiper arm. <Ref. to WW-17, REMOVAL, Rear Wiper Arm.>
- 6) Remove the rear wiper motor. <Ref. to WW-18, REMOVAL, Rear Wiper Motor.>
- 7) Remove the rear gate outer handle. <Ref. to SL-41, REMOVAL, Rear Gate Outer Handle.>
- 8) Remove the rear gate latch assembly. <Ref. to SL-42, REMOVAL, Rear Gate Latch Assembly.>
- 9) Detach the roof spoiler. <Ref. to EI-40, REMOVAL, Roof Spoiler.>
- 10) Remove the harness clip of each connector from rear gate panel.
- 11) Remove the weather strip clips (A), and remove the rear gate panel weather strip.

NOTE:

If the weather strip clip is removed with excessive force, the weather strip may be damaged. Be sure to use clip remover to remove.

- 12) Remove the rubber duct (A) connection, and pull out the harness and washer hose from rear gate.

- 13) Before removing the rear gate damper stay, prevent the rear gate from closing using prop or the like.

CAUTION:

If the prop comes off, operators may get injured and vehicle may get damaged. Make sure to support the rear gate with secure material to prevent injury or damage.

- 14) Remove the mounting bolts of rear gate damper stay.

Rear Gate

EXTERIOR BODY PANELS

15) Remove the rear gate hinge bolts, and remove the rear gate panel.

16) Remove the rear gate hinge from vehicle.

2. REAR GATE DAMPER STAY

CAUTION:

- Do not damage piston rods and oil seals.
- Never disassemble cylinders; They contain gas.

1) Open the rear gate.

2) Before removing the rear gate damper stay, prevent the rear gate from closing using prop or the like.

CAUTION:

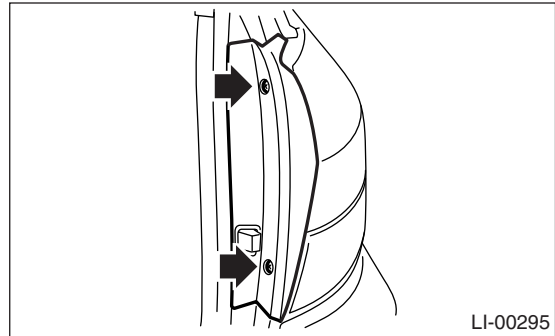

If the prop comes off, operators may get injured and vehicle may get damaged. Make sure to support the rear gate with secure material to prevent injury or damage.

3) Remove the mounting bolts of rear gate damper stay.

4) Remove the clips and then detach the rear combination light covers.

5) Remove the mounting bolt (A), and remove the damper stay.

B: INSTALLATION

1. REAR GATE PANEL

1) Install in the reverse order of removal.

2) Install with attention to make uniform clearance between rear gate panel and body. For the dimension of clearance, refer to "SPECIFICATION" in "General Description". <Ref. to EB-2, SPECIFICATION, General Description.>

Tightening torque:

25 N·m (2.6 kgf·m, 18.4 ft·lb)

2. REAR GATE DAMPER STAY

1) Prevent the rear gate from closing using prop or the like.

CAUTION:

If the prop comes off, operators may get injured and vehicle may get damaged. Make sure to support the rear gate with secure material to prevent injury or damage.

2) Install in the reverse order of removal.

Tightening torque:

Refer to “COMPONENT” of “General Description”.

<Ref. to EB-11, REAR GATE PANEL, COMPONENT, General Description.>

C: DISPOSAL

1. REAR GATE DAMPER STAY

CAUTION:

The gas is colorless, odorless and harmless. However, gas pressure may spray cutting powder or oil. Be sure to wear dust-resistant goggles.

1) Cover with a vinyl sack as shown in the figure.

- (1) Rear gate damper stay
- (2) Vinyl sack

NOTE:

Prevent the vinyl sack from being caught by drill cutting edge.

2) Lift the body side slightly with piston rods fully extended, and secure the body side with vise.

Drill a hole in 2 to 3 mm (0.08 to 0.12 in) diameter at a point 10 to 200 mm (0.39 to 7.87 in) from door side, and bleed rear gate damper stay gas completely.

- (1) Body side
- (2) Door side
- (3) 190 mm (7.48 in)
- (4) 10 mm (0.39 in)
- (5) Piston rod
- (6) Cylinder
- (7) Portion to be drilled

Rear Gate

EXTERIOR BODY PANELS

General Description

CRUISE CONTROL SYSTEM

1. General Description

A: COMPONENT

- (1) Engine control module (ECM)
- (2) Cruise control command switch
- (3) Stop light and brake switch

- (4) Cruise indicator light and cruise set indicator light
- (5) Transmission control module (TCM) (AT model)

- (6) Inhibitor switch (AT model)
- (7) Neutral position switch (MT model)
- (8) Clutch switch (MT model)

B: CAUTION

- Before disassembling or reassembling parts, always disconnect the battery ground cable from battery. When repairing the audio, control module, etc. which are provided with memory functions, record the memory contents before disconnecting the ground cable from battery. Otherwise, the memory will be erased.
- Reassemble the parts in the reverse order of disassembly unless otherwise indicated.
- Adjust the parts to specifications specified in this manual.
- Connect the connectors securely during reassembly.
- After reassembly, ensure functional parts operate properly.

C: PREPARATION TOOL

TOOL NAME	REMARKS
Circuit tester	Used for measuring resistance and voltage.

2. Cruise Control Unit

A: NOTE

The control of cruise control system is carried out in Engine control module (ECM).

B: REMOVAL

<Ref. to FU(H4SO)-35, REMOVAL, Engine Control Module (ECM).> <Ref. to FU(H4SO U5)-44, REMOVAL, Engine Control Module (ECM).> <Ref. to FU(H4DOTC)-39, REMOVAL, Engine Control Module (ECM).> <Ref. to FU(H6DO)-34, REMOVAL, Engine Control Module (ECM).>

C: INSTALLATION

<Ref. to FU(H4SO)-35, INSTALLATION, Engine Control Module (ECM).> <Ref. to FU(H4SO U5)-44, INSTALLATION, Engine Control Module (ECM).> <Ref. to FU(H4DOTC)-39, INSTALLATION, Engine Control Module (ECM).> <Ref. to FU(H6DO)-34, INSTALLATION, Engine Control Module (ECM).>

3. Cruise Control Command Switch

A: REMOVAL

WARNING:

Before servicing, be sure to read the notes in the “AB” section for proper handling of the driver’s airbag module. <Ref. to AB-5, CAUTION, General Description.>

- 1) Set the front wheels in straight ahead position.
- 2) Turn the ignition switch to OFF.
- 3) Disconnect the ground cable from battery and wait for at least 20 seconds before starting work.
- 4) Using TORX® BIT T30 (Tamper resistant type), loosen the two TORX® bolts which secure driver’s airbag module.

(1) TORX® BIT T30

- 5) Disconnect the airbag module connector on back of the airbag module.
- 6) Remove the steering wheel. <Ref. to PS-14, REMOVAL, Steering Wheel.>
- 7) Remove the four screws to remove the lower cover from steering wheel.

CC-00181

- 8) Remove one screw to remove the cruise control command switch from lower cover.

CC-00182

B: INSTALLATION

Install in the reverse order of removal.

C: INSPECTION

Measure the cruise control command switch resistance.

CC-00252

Switch	Area	Terminal No.	Standard
CANCEL SET/COAST RESUME/ ACCEL	ALL OFF	2 and 3	Approx. 4 kΩ
CANCEL	ON	2 and 3	Less than 1 Ω
SET/COAST	ON	2 and 3	Approx. 250 Ω
RESUME/ ACCEL	ON	2 and 3	Approx. 1500 Ω
MAIN	OFF	1 and 2	More than 1 MΩ
	ON	1 and 2	Less than 1 Ω

If NG, replace the cruise control command switch.

Stop Light & Brake Switch

CRUISE CONTROL SYSTEM

4. Stop Light & Brake Switch

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Disconnect the connector from stop light and brake switch, and then remove the switch. <Ref. to BR-41, REMOVAL, Stop Light Switch.>

B: INSTALLATION

Install in the reverse order of removal.

C: INSPECTION

Measure the resistance of brake switch (A) and stop light switch (B).

Switch	Pedal	Terminal No.	Standard
Brake	Released	1 and 4	Less than 1 Ω
	Depressed	1 and 4	More than 1 M Ω
Stop Light	Released	2 and 3	More than 1 M Ω
	Depressed	2 and 3	Less than 1 Ω

If NG, replace the stop light and brake switch.

5. Clutch Switch

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Disconnect the connector from clutch switch, and then remove the switch. <Ref. to CL-21, DIS-ASSEMBLY, Clutch Pedal.>

B: INSTALLATION

Install in the reverse order of removal.

C: INSPECTION

Measure the clutch switch resistance.

Switch	Pedal	Terminal No.	Standard
Clutch	Released	1 and 2	Less than 1 Ω
	Depressed	1 and 2	More than 1 M Ω

If NG, replace the clutch switch.

6. Inhibitor Switch

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Disconnect the connector from inhibitor switch, and then remove the switch. <Ref. to 4AT-48, REMOVAL, Inhibitor Switch.>

B: INSTALLATION

Install in the reverse order of removal.

C: INSPECTION

Measure the inhibitor switch resistance.

Selector lever position	Terminal No.	Standard
P	7 and 12	Less than 1 Ω
N		Less than 1 Ω
Except P and N		More than 1 MΩ

If NG, replace the inhibitor switch.

7. Neutral Position Switch

A: REMOVAL

- 1) Disconnect the ground cable from battery.
- 2) Disconnect the connector from neutral position switch, and then remove the switch. <Ref. to 5MT-34, BACK-UP LIGHT SWITCH AND NEUTRAL POSITION SWITCH, REMOVAL, Switches and Harness.>

B: INSTALLATION

Install in the reverse order of removal.

C: INSPECTION

Measure the neutral position switch resistance.

Gear shift position	Terminal No.	Standard
Neutral position	1 and 2	Less than 1 Ω
Other positions		More than 1 MΩ

If NG, replace the neutral position switch.

Basic Diagnostic Procedure

CRUISE CONTROL SYSTEM (DIAGNOSTICS)

1. Basic Diagnostic Procedure

A: PROCEDURE

Step	Check	Yes	No	
1	CHECK MALFUNCTION INDICATOR LIGHT. Ensure the malfunction indicator light illuminates.	Does the malfunction indicator light illuminate?	Go to step 5.	Go to step 2.
2	CHECK CRUISE INDICATOR LIGHT. Ensure the cruise indicator light blinks.	Does the cruise indicator light blink?	Go to step 5.	Go to step 3.
3	CHECK CRUISE CONTROL MAIN SWITCH OPERATION. Check the cruise control main switch operation. (Ensure the cruise indicator light illuminates.)	Is the cruise control main switch turned on? (Does the cruise indicator light illuminate?)	Go to step 4.	Go to phenomenon 1. <Ref. to CC(ETC)(diag)-10, DIAGNOSTIC PROCEDURE WITH PHENOMENON, Diagnostics with Phenomenon.>
4	CHECK CRUISE CONTROL SET OPERATION. Check the cruise control set operation.	Can the cruise control be set while driving at more than 40 km/h (25 MPH)?	Go to step 6.	Go to step 5.
5	PERFORM CRUISE CANCEL CONDITIONS DIAGNOSIS. Perform the cruise cancel conditions diagnosis.	Is DTC displayed?	Go to "List of Diagnostic Trouble Code (DTC)". <Ref. to CC(ETC)(diag)-12, List of Diagnostic Trouble Code (DTC).>	Go to phenomenon 2. <Ref. to CC(ETC)(diag)-10, DIAGNOSTIC PROCEDURE WITH PHENOMENON, Diagnostics with Phenomenon.>
6	CHECK CRUISE SET INDICATOR LIGHT. Ensure the cruise set indicator light illuminates.	Does the cruise set indicator light illuminate?	Go to step 7.	Go to phenomenon 3. <Ref. to CC(ETC)(diag)-10, DIAGNOSTIC PROCEDURE WITH PHENOMENON, Diagnostics with Phenomenon.>
7	CHECK VEHICLE SPEED IS HELD WITHIN SET SPEED. Make sure the vehicle speed is held within set speed.	Is vehicle speed held within set speed ± 3 km/h (± 2 MPH)? (Make an inspection on a level road.)	Go to step 8.	Go to phenomenon 4. <Ref. to CC(ETC)(diag)-10, DIAGNOSTIC PROCEDURE WITH PHENOMENON, Diagnostics with Phenomenon.>
8	CHECK RESUME/ACCEL OPERATION. Check the RESUME/ACCEL switch operation.	Does the vehicle speed increase or return to set speed after RESUME/ACCEL switch has been pressed?	Go to step 9.	Go to phenomenon 5. <Ref. to CC(ETC)(diag)-10, DIAGNOSTIC PROCEDURE WITH PHENOMENON, Diagnostics with Phenomenon.>

Basic Diagnostic Procedure

CRUISE CONTROL SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
9 CHECK SET/COAST OPERATION. Check the SET/COAST switch operation.	Does the vehicle speed decrease after SET/COAST switch has been pressed?	Go to step 10 .	Go to phenomenon 6. <Ref. to CC(ETC)(diag)-10, DIAGNOSTIC PROCEDURE WITH PHENOMENON, Diagnostics with Phenomenon.>
10 CHECK CANCEL OPERATION. Check the CANCEL switch operation.	Is the cruise control released after CANCEL switch has been pressed?	Go to step 11 .	Go to phenomenon 7. <Ref. to CC(ETC)(diag)-10, DIAGNOSTIC PROCEDURE WITH PHENOMENON, Diagnostics with Phenomenon.>
11 CHECK CRUISE CONTROL RELEASE OPERATION. Check the cruise control release operation.	Is the cruise control released after brake pedal has been depressed?	Go to step 12 .	Go to phenomenon 8. <Ref. to CC(ETC)(diag)-10, DIAGNOSTIC PROCEDURE WITH PHENOMENON, Diagnostics with Phenomenon.>
12 CHECK CRUISE CONTROL RELEASE OPERATION. Check the cruise control release operation.	Is the cruise control released after shifting to the neutral position?	Go to step 13 .	Go to phenomenon 9. <Ref. to CC(ETC)(diag)-10, DIAGNOSTIC PROCEDURE WITH PHENOMENON, Diagnostics with Phenomenon.>
13 CHECK CRUISE CONTROL RELEASE OPERATION. Check the cruise control release operation.	Is the cruise control released after depressing the clutch pedal?	Finish the diagnosis.	Go to phenomenon 10. <Ref. to CC(ETC)(diag)-10, DIAGNOSTIC PROCEDURE WITH PHENOMENON, Diagnostics with Phenomenon.>

General Description

CRUISE CONTROL SYSTEM (DIAGNOSTICS)

2. General Description

A: CAUTION

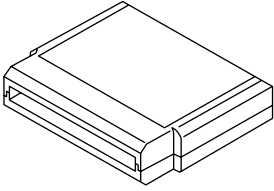

Airbag system wiring harness is routed near the cruise control command switch.

CAUTION:

- All airbag system wiring harnesses and connectors are yellow. Do not use the electrical test equipment on these circuits.
- Be careful not to damage the airbag system wiring harness when servicing the cruise control command switch.

B: PREPARATION TOOL

1. SPECIAL TOOL

ILLUSTRATION	TOOL NUMBER	DESCRIPTION	REMARKS
 ST24082AA260	24082AA260	CARTRIDGE	Troubleshooting for electrical system
 ST22771AA030	22771AA030	SUBARU SELECT MONITOR KIT	Troubleshooting for electrical system

2. GENERAL TOOL

TOOL NAME	REMARKS
Circuit tester	Used for measuring resistance, voltage and ampere.

C: INSPECTION

Measure the battery voltage and specific gravity of electrolyte.

Standard voltage:

12 V or more

Specific gravity:

More than 1.260

Electrical Component Location

CRUISE CONTROL SYSTEM (DIAGNOSTICS)

Neutral signal (AT model)		D9	<ul style="list-style-type: none"> "Approx. 5 V" voltage (4AT model) or battery voltage (5AT model) is present when the shift lever is set in any position except "P" or "N". "0 V" voltage is present when the shift lever is set in "P" or "N" position.

Engine Control Module (ECM) I/O Signal

CRUISE CONTROL SYSTEM (DIAGNOSTICS)

B: WIRING DIAGRAM

<Ref. to WI-125, WIRING DIAGRAM, Cruise Control System.>

Subaru Select Monitor

CRUISE CONTROL SYSTEM (DIAGNOSTICS)

5. Subaru Select Monitor

A: OPERATION

1. GENERAL DESCRIPTION

For the on-board diagnosis function of the cruise control system, use Subaru Select Monitor.

The on-board diagnosis function operates under two categories, which are used depending on the type of problems;

1) Cruise Control Cancel Conditions Diagnosis:

(1) This category of diagnosis requires actual vehicle driving in order to determine the cause, as when cruise speed is cancelled during driving although cruise cancel condition is not entered.

(2) Cruise control memory in ECM stores the cancel condition (Code No.) which occurred during driving. When there are plural cancel conditions (Code No.), they are shown on the Subaru Select Monitor.

CAUTION:

- The cruise control memory stores not only the cruise “cancel” which occurred (although “cancel” operation is not entered by the driver), but also the “cancel” condition input by the driver.

- The content of memory is cleared when ignition switch or cruise control main switch is turned OFF.

2) Real-time Diagnosis:

Real-time diagnosis function is used to determine whether or not the input signal system is in good order, according to the signal emitted from switches, sensors, etc.

(1) Vehicle cannot be driven at cruise speed when problem occurs in the cruise control system or its associated circuits.

(2) Monitor the signal conditions from switches and sensors.

2. CRUISE CANCEL CONDITIONS DIAGNOSIS

1) Prepare the Subaru Select Monitor kit.

CC-00028

2) Connect the diagnosis cable to Subaru Select Monitor.

3) Insert the cartridge to Subaru Select Monitor.
<Ref. to CC(ETC)(diag)-4, SPECIAL TOOL, PREPARATION TOOL, General Description.>

CC-00029

4) Connect the Subaru Select Monitor to data link connector.

(1) Data link connector is located in the lower portion of instrument panel (on the driver's side).

IM-00084

(2) Connect the diagnosis cable to data link connector.

5) Start the engine and turn the cruise control main switch to ON.

6) Turn the Subaru Select Monitor switch to ON.

CC-00045

(1) Power switch

7) On the «Main Menu» display screen, select the {Each System Check} and press the [YES] key. On the system selection display screen, select the {Engine} and press the [YES] key. Press the [YES] key after the information of engine type is displayed.

8) Drive vehicle at least 40 km/h (25 MPH) with cruise speed set.

9) If the cruise speed is canceled by itself (without doing any cancel operations), DTC will display on the screen when selecting the {Check Cancel Code} and pressing the [YES] key on the engine malfunction diagnosis display screen.

CAUTION:

- **When performing diagnostics, observe the legal speed of the road.**
- **DTC will also displayed when cruise control cancel is effected by driver. Do not confuse.**
- **Put a co-worker in the vehicle to assist the diagnosis during driving.**

NOTE:

DTC will be cleared by turning ignition switch or cruise control main switch to OFF.

3. REAL-TIME DIAGNOSIS

- 1) Connect the Subaru Select Monitor.
- 2) Turn the ignition switch and cruise control main switch to ON.
- 3) Turn the Subaru Select Monitor switch to ON.
- 4) On the «Main Menu» display screen, select the {Each System Check} and press the [YES] key.
- 5) On the «System Selection Menu» display screen, select the {Engine} and press the [YES] key.
- 6) Press the [YES] key after the information of engine type is displayed.
- 7) On the «Cruise Control Diagnosis» display screen, select the {Current Data Display/Save}, and then press the [YES] key.
- 8) Make sure that normal indication is displayed when operated as follows:
 - Depress/release the brake pedal. (Stop light switch and brake switch turn ON.)
 - Turn the main switch to ON.
 - Turn the “CANCEL” switch to ON.
 - Turn ON the “SET/COAST” switch.
 - Turn ON the “RESUME/ACCEL” switch.
 - Depress or release the clutch pedal.
 - Place the shift lever in any position except neutral.

NOTE:

- For details concerning operation procedure, refer to “SUBARU SELECT MONITOR OPERATION MANUAL”.
- For DTC, refer to “List of Diagnostic Trouble Code (DTC)”. <Ref. to CC(ETC)(diag)-12, List of Diagnostic Trouble Code (DTC).>

Diagnostics with Phenomenon

CRUISE CONTROL SYSTEM (DIAGNOSTICS)

6. Diagnostics with Phenomenon

A: DIAGNOSTIC PROCEDURE WITH PHENOMENON

Phenomenon		Checking item	Reference
1	Cruise control main switch is not turned to ON. (Cruise indicator light does not illuminate.)	(1) Check the cruise indicator light.	<Ref. to CC(ETC)(diag)-11, CHECK CRUISE INDICATOR LIGHT AND CRUISE SET INDICATOR LIGHT., Diagnostics with Phenomenon.>
		(2) Check the cruise control command switch.	<Ref. to CC(ETC)(diag)-15, DTC 11, 15, 21 AND 24 CRUISE CONTROL COMMAND SWITCH, Diagnostic Procedure with Diagnostic Trouble Code (DTC).>
2	Cruise control cannot be set.	(1) Check the cruise control command switch.	<Ref. to CC(ETC)(diag)-15, DTC 11, 15, 21 AND 24 CRUISE CONTROL COMMAND SWITCH, Diagnostic Procedure with Diagnostic Trouble Code (DTC).>
		(2) Check the stop light switch and brake switch.	<Ref. to CC(ETC)(diag)-17, DTC 12 AND 25 STOP LIGHT SWITCH AND BRAKE SWITCH, Diagnostic Procedure with Diagnostic Trouble Code (DTC).>
		(3) Check the clutch switch.	<Ref. to CC(ETC)(diag)-19, DTC 13 CLUTCH SWITCH, Diagnostic Procedure with Diagnostic Trouble Code (DTC).>
		(4) Check the neutral position switch.	<Ref. to CC(ETC)(diag)-21, DTC 14 NEUTRAL POSITION SWITCH, Diagnostic Procedure with Diagnostic Trouble Code (DTC).>
		(5) Check the vehicle speed sensor.	<Ref. to CC(ETC)(diag)-26, DTC 22 AND 32 VEHICLE SPEED SENSOR, Diagnostic Procedure with Diagnostic Trouble Code (DTC).>
3	Cruise set indicator light does not illuminate.	Check the cruise set indicator light.	<Ref. to CC(ETC)(diag)-11, CHECK CRUISE INDICATOR LIGHT AND CRUISE SET INDICATOR LIGHT., Diagnostics with Phenomenon.>
4	Vehicle speed is not held within set speed ± 3 km/h (± 2 MPH).	Inspect the vehicle speed sensor.	<Ref. to CC(ETC)(diag)-26, DTC 22 AND 32 VEHICLE SPEED SENSOR, Diagnostic Procedure with Diagnostic Trouble Code (DTC).>
5	Vehicle speed does not increase or does not return to set speed after RESUME/ACCEL switch has been pressed.	Check the RESUME/ACCEL switch.	<Ref. to CC(ETC)(diag)-15, DTC 11, 15, 21 AND 24 CRUISE CONTROL COMMAND SWITCH, Diagnostic Procedure with Diagnostic Trouble Code (DTC).>
6	Vehicle speed does not decrease after SET/COAST switch has been pressed.	Check the SET/COAST switch.	<Ref. to CC(ETC)(diag)-15, DTC 11, 15, 21 AND 24 CRUISE CONTROL COMMAND SWITCH, Diagnostic Procedure with Diagnostic Trouble Code (DTC).>
7	Cruise control is not released after CANCEL switch has been pressed.	Check the CANCEL switch.	<Ref. to CC(ETC)(diag)-15, DTC 11, 15, 21 AND 24 CRUISE CONTROL COMMAND SWITCH, Diagnostic Procedure with Diagnostic Trouble Code (DTC).>
8	Cruise control is not released after brake pedal has been depressed.	Check the stop light switch and brake switch.	<Ref. to CC(ETC)(diag)-17, DTC 12 AND 25 STOP LIGHT SWITCH AND BRAKE SWITCH, Diagnostic Procedure with Diagnostic Trouble Code (DTC).>
9	Cruise control is not released after shifting to the neutral position.	Check the neutral position switch.	<Ref. to CC(ETC)(diag)-21, DTC 14 NEUTRAL POSITION SWITCH, Diagnostic Procedure with Diagnostic Trouble Code (DTC).>
10	Cruise control is not released after clutch pedal has been depressed.	Check the clutch switch.	<Ref. to CC(ETC)(diag)-19, DTC 13 CLUTCH SWITCH, Diagnostic Procedure with Diagnostic Trouble Code (DTC).>

Diagnostics with Phenomenon

CRUISE CONTROL SYSTEM (DIAGNOSTICS)

B: CHECK CRUISE INDICATOR LIGHT AND CRUISE SET INDICATOR LIGHT.

TROUBLE SYMPTOM:

Cruise control can be set, but the cruise indicator light and cruise set indicator light do not illuminate.

Step	Check	Yes	No
1 CHECK CRUISE INDICATOR LIGHT AND CRUISE SET INDICATOR LIGHT. 1) Perform the self-diagnosis for combination meter. <Ref. to IDI-3, SELF-DIAGNOSIS, INSPECTION, Combination Meter System.> 2) Check the cruise indicator light and cruise set indicator light illuminate.	Does the cruise indicator light and cruise set indicator light illuminate?	Go to step 2.	Replace the meter case assembly. <Ref. to IDI-15, Combination Meter.>
2 CHECK LAN COMMUNICATION CIRCUIT ERROR DISPLAY. 1) Turn the ignition switch to ON again after completing self-diagnosis. 2) Check that communication error is displayed on the odo/trip meter in combination meter.	Is the error code "Er xx" displayed on odo/trip meter?	Check the LAN communication circuit. <Ref. to LAN(diag)-2, Basic Diagnostic Procedure.>	Replace the ECM. <Ref. to FU(H4SO)-35, Engine Control Module (ECM).> <Ref. to FU(H4SO U5)-44, Engine Control Module (ECM).> <Ref. to FU(H4DOTC)-39, Engine Control Module (ECM).> <Ref. to FU(H6DO)-34, Engine Control Module (ECM).>

List of Diagnostic Trouble Code (DTC)

CRUISE CONTROL SYSTEM (DIAGNOSTICS)

7. List of Diagnostic Trouble Code (DTC)

A: LIST

DTC	Item	Contents of diagnosis	Reference
11	Main switch	Main switch of cruise control command switch is turned to OFF, and then the cruise control is released.	This DTC is indicated without operating the main switch. <Ref. to CC(ETC)(diag)-15, DTC 11, 15, 21 AND 24 CRUISE CONTROL COMMAND SWITCH, Diagnostic Procedure with Diagnostic Trouble Code (DTC).>
12	Stop and brake switch	Stop light switch or brake switch is turned to ON, and then the cruise control is released.	This DTC is indicated without depressing the brake pedal. <Ref. to CC(ETC)(diag)-17, DTC 12 AND 25 STOP LIGHT SWITCH AND BRAKE SWITCH, Diagnostic Procedure with Diagnostic Trouble Code (DTC).>
13	Clutch switch	Clutch switch is turned to ON, and then the cruise control is released.	This DTC is indicated without depressing the brake pedal. <Ref. to CC(ETC)(diag)-19, DTC 13 CLUTCH SWITCH, Diagnostic Procedure with Diagnostic Trouble Code (DTC).>
14	Neutral switch	Neutral position switch is turned to ON, and then the cruise control is released.	This DTC is indicated without shifting to neutral position. <Ref. to CC(ETC)(diag)-21, DTC 14 NEUTRAL POSITION SWITCH, Diagnostic Procedure with Diagnostic Trouble Code (DTC).>
15	Cancel switch	Cancel switch is turned to ON, and then the cruise control is released.	This DTC is indicated without operating the cancel switch. <Ref. to CC(ETC)(diag)-15, DTC 11, 15, 21 AND 24 CRUISE CONTROL COMMAND SWITCH, Diagnostic Procedure with Diagnostic Trouble Code (DTC).>
16	Ignition switch	Ignition switch is turned to OFF, and then the cruise control is released.	This DTC is indicated without operating the ignition switch. <Ref. to CC(ETC)(diag)-25, DTC 16 IGNITION SWITCH, Diagnostic Procedure with Diagnostic Trouble Code (DTC).>

List of Diagnostic Trouble Code (DTC)

CRUISE CONTROL SYSTEM (DIAGNOSTICS)

DTC	Item	Contents of diagnosis	Reference
21	Cruise Control Switch Malfunction When Ignition Switch Is Turned To ON	When the ignition switch is turned to ON, each switch of cruise control command switch is already turned to ON.	This DTC is indicated without operating the main switch. <Ref. to CC(ETC)(diag)-15, DTC 11, 15, 21 AND 24 CRUISE CONTROL COMMAND SWITCH, Diagnostic Procedure with Diagnostic Trouble Code (DTC).>
22	Vehicle Speed Variation Malfunction	Malfunction of vehicle speed signal variation is detected.	<Ref. to CC(ETC)(diag)-26, DTC 22 AND 32 VEHICLE SPEED SENSOR, Diagnostic Procedure with Diagnostic Trouble Code (DTC).>
23	Engine Related Sensor Malfunction	Malfunction related to engine is detected.	<Ref. to EN(H4SO)(diag)-2, Basic Diagnostic Procedure.> <Ref. to EN(H4SO U5)(diag)-2, Basic Diagnostic Procedure.> <Ref. to EN(H4DOTC)(diag)-2, Basic Diagnostic Procedure.> <Ref. to EN(H6DO)(diag)-2, Basic Diagnostic Procedure.>
24	Cruise Control Related Switch Malfunction	Command switch malfunction is detected. (When the switch is being pressed ON for an abnormal period of time (about two minutes), open circuit is detected.)	This DTC is indicated with normal operation. <Ref. to CC(ETC)(diag)-15, DTC 11, 15, 21 AND 24 CRUISE CONTROL COMMAND SWITCH, Diagnostic Procedure with Diagnostic Trouble Code (DTC).>
25	Brake Switch Input Circuit Malfunction	Malfunction of brake switch input circuit in ECM is detected.	<Ref. to CC(ETC)(diag)-17, DTC 12 AND 25 STOP LIGHT SWITCH AND BRAKE SWITCH, Diagnostic Procedure with Diagnostic Trouble Code (DTC).>
26	Engine speed signal	<ul style="list-style-type: none"> Abnormal increase of engine speed is detected. Gear is placed in Neutral, 1st or Reverse positions. 	Cruise in more than 2nd shift position.
32	Out of Vehicle Speed of Cruise Control Operation	<ul style="list-style-type: none"> Controlled vehicle speed decreased under the limit during cruising. Set operation was performed out of vehicle speed available for setting. Resume operation was performed without memorized vehicle speed. 	This DTC is displayed though the vehicle speed is increased to the speed available for cruise set and set operation was performed again. <Ref. to CC(ETC)(diag)-26, DTC 22 AND 32 VEHICLE SPEED SENSOR, Diagnostic Procedure with Diagnostic Trouble Code (DTC).>

List of Diagnostic Trouble Code (DTC)

CRUISE CONTROL SYSTEM (DIAGNOSTICS)

DTC	Item	Contents of diagnosis	Reference
33	WAIT is prohibited after operating accelerator pedal.	Controlled vehicle speed increased above the limit during cruising.	This DTC is displayed when driving at higher speed than appropriate cruise control speed. In this case, lower the vehicle speed to the speed available for cruise set, and perform cruise set operation again.
34	Prohibited when accelerator pedal position large is continued.	The vehicle has been driven at higher speed than set vehicle speed for an abnormal period of time (about 10 minutes) during cruise driving.	This DTC is displayed when driving for a long period of time at higher speed than appropriate cruise set vehicle speed by operating accelerator pedal. In this case, release the cruise set.
35	Prohibited when vehicle speed feedback unavailable.	Set vehicle speed cannot keep because of some reasons (steep uphill, parking brake, abnormal decrease of engine output, etc.) during cruise driving.	This DTC is displayed when driving condition is not suitable for cruise control. Perform cruise set operation again after eliminating the estimated cause.
41	VDC/TCS operation	Vehicle dynamics control (VDC) or TCS is operated during cruise driving or cruise setting.	This DTC is displayed when driving condition is not suitable for cruise control. Perform cruise set operation again after eliminating the estimated cause.
42	High speed CAN communication malfunction	High speed CAN communication malfunction is detected during cruise driving or cruise setting.	<Ref. to LAN(diag)-2, Basic Diagnostic Procedure.>
43	ABS/VDC malfunction	ABS or vehicle dynamics control (VDC) system malfunction is detected during cruise driving or cruise setting.	<Ref. to ABS(diag)-2, Basic Diagnostic Procedure.> or <Ref. to VDC(diag)-2, Basic Diagnostic Procedure.>
44	Body integrated module malfunction	Body integrated module system malfunction is detected during cruise driving or cruise setting.	<Ref. to LAN(diag)-2, Basic Diagnostic Procedure.>
45	Meter malfunction	Combination meter malfunction is detected during cruise driving or cruise setting.	<Ref. to LAN(diag)-2, Basic Diagnostic Procedure.>

8. Diagnostic Procedure with Diagnostic Trouble Code (DTC)

A: DTC 11, 15, 21 AND 24 CRUISE CONTROL COMMAND SWITCH

TROUBLE SYMPTOM:

- Cruise control cannot be set. (Cancelled immediately.)
- Cruise control cannot be released.

WIRING DIAGRAM:

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

CRUISE CONTROL SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
<p>1 CHECK CRUISE CONTROL COMMAND SWITCH.</p> <p>1) Remove the driver's airbag module. <Ref. to AB-16, REMOVAL, Driver's Airbag Module.></p> <p>2) Disconnect the harness connector of cruise control command switch.</p> <p>3) Turn the ignition switch to ON.</p> <p>4) Measure the voltage between harness connector terminal and chassis ground.</p> <p>Connector & terminal (ST3) No. 1 (+) — Chassis ground (-): (ST3) No. 3 (+) — Chassis ground (-):</p>	Is the voltage more than 5 V?	Go to step 2.	Check the harness for open or short circuit between cruise control command switch and ECM.
<p>2 INSPECTION FOR CANCEL SWITCH.</p> <p>1) Turn the ignition switch to OFF.</p> <p>2) Remove the cruise control command switch. <Ref. to CC-5, REMOVAL, Cruise Control Command Switch.></p> <p>3) Measure the resistance between switch terminals when CANCEL switch is pressed and not pressed.</p> <p>Terminals No. 2 — No. 3:</p>	Is the resistance less than 1 Ω when CANCEL switch is pressed? CRUISE CONTROL SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
2 CHECK NEUTRAL POSITION SWITCH. 1) Connect the Subaru Select Monitor to data link connector. 2) Turn the ignition switch and Subaru Select Monitor switch to ON. 3) Select {Engine} from the main menu. 4) Then, select {Current Data Display & Save}. 5) Check the neutral position switch signal by shifting the select lever to "P" or "N" range.	Is ON displayed in the Subaru Select Monitor when the select lever is in "P" or "N" range? Or is OFF displayed in the Subaru Select Monitor when the select lever is in other than "P" or "N" range?	Replace the ECM. <Ref. to FU(H4DOTC)-39, Engine Control Module (ECM).> <Ref. to FU(H6DO)-34, Engine Control Module (ECM).>	Go to step 3.
3 CHECK TCM OUTPUT VOLTAGE. 1) Turn the ignition switch to ON. 2) Measure the voltage between TCM harness connector terminal and chassis ground. Connector & terminal (B55) No. 19 (+) — Chassis ground (-):	Is the voltage more than 10 V when the select lever is in other than "P" or "N" range? Or is the voltage less than 1 V when the select lever is in "P" or "N" range?	Go to step 4.	Inspect the TCM. <Ref. to 5AT(diag)-2, Basic Diagnostic Procedure.>
4 CHECK HARNESS BETWEEN TCM AND ECM. 1) Turn the ignition switch to OFF. 2) Disconnect the harness connector from TCM and ECM. 3) Measure the resistance between TCM harness connector terminal and ECM harness connector terminal. Connector & terminal (B137) No. 9 — (B55) No. 19:	Is the resistance less than 10 Ω ?	Replace the ECM. <Ref. to FU(H4DOTC)-39, Engine Control Module (ECM).> <Ref. to FU(H6DO)-34, Engine Control Module (ECM).>	Repair the wiring harness.
5 CHECK TRANSMISSION TYPE.	Is the transmission type 4AT?	Go to step 6.	Go to step 9.
6 CHECK INHIBITOR SWITCH CIRCUIT. 1) Turn the ignition switch to OFF. 2) Disconnect the inhibitor switch harness connector. 3) Turn the ignition switch to ON. 4) Measure the voltage between harness connector terminal and chassis ground. Connector & terminal (T7) No. 12 (+) — Chassis ground (-):	Is the voltage approx. 5 V?	Go to step 7.	Check the harness for open or short between inhibitor switch and ECM.
7 CHECK INHIBITOR SWITCH CIRCUIT. 1) Turn the ignition switch to OFF. 2) Disconnect the starter motor harness connector. 3) Measure the resistance between inhibitor switch harness connector terminal and chassis ground. Connector & terminal (T7) No. 7 — Chassis ground:	Is the resistance less than 10 Ω ?	Go to step 8.	Repair the harness.
8 CHECK INHIBITOR SWITCH. Remove and check the inhibitor switch. <Ref. to CC-8, Inhibitor Switch.>	Is the inhibitor switch OK?	Replace the ECM. <Ref. to FU(H4SO)-35, Engine Control Module (ECM).> <Ref. to FU(H4SO U5)-44, Engine Control Module (ECM).>	Replace the inhibitor switch.

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

CRUISE CONTROL SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
9 CHECK NEUTRAL POSITION SWITCH CIRCUIT. 1) Turn the ignition switch to OFF. 2) Disconnect the neutral position switch harness connector. 3) Turn the ignition switch to ON. 4) Measure the voltage between harness connector terminal and chassis ground. Connector & terminal SOHC model: (B25) No. 1 (+) — Chassis ground (-): Turbo model: (B391) No. 1 (+) — Chassis ground (-):	Is the voltage approx. 5 V?	Go to step 10.	Check the harness for open or short between neutral position switch and ECM.
10 CHECK NEUTRAL POSITION SWITCH CIRCUIT. 1) Turn the ignition switch to OFF. 2) Measure the resistance between neutral position switch harness connector terminal and chassis ground. Connector & terminal SOHC model: (B25) No. 2 — Chassis ground: Turbo model: (B391) No. 3 — Chassis ground:	Is the resistance less than 10 Ω ?	Go to step 11.	Repair the harness.
11 CHECK NEUTRAL POSITION SWITCH. Remove and check the neutral position switch. <Ref. to CC-9, Neutral Position Switch.>	Is the neutral position switch OK?	Replace the ECM. <Ref. to FU(H4SO)-35, Engine Control Module (ECM).> <Ref. to FU(H4SO U5)-44, Engine Control Module (ECM).> <Ref. to FU(H4DOTC)-39, Engine Control Module (ECM).>	Replace the neutral position switch.

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

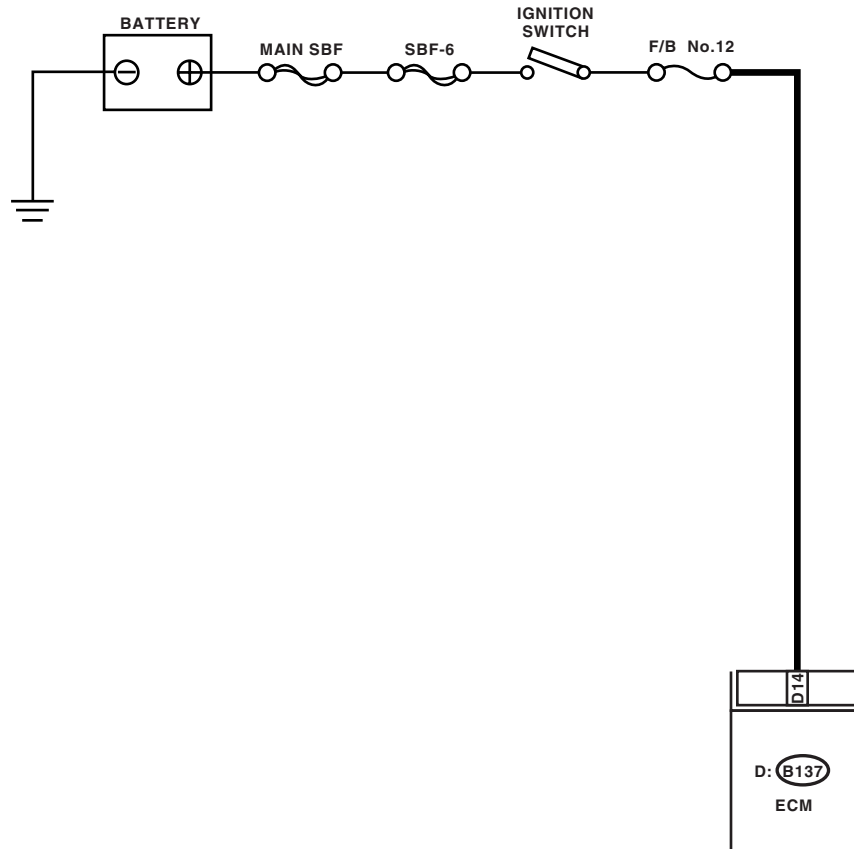

CRUISE CONTROL SYSTEM (DIAGNOSTICS)

E: DTC 16 IGNITION SWITCH

TROUBLE SYMPTOM:

Cruise control cannot be set.

WIRING DIAGRAM:

D: **B137**

CC-00368

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

CRUISE CONTROL SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
1 CHECK IGNITION SWITCH CIRCUIT. 1) Turn the ignition switch to OFF. 2) Disconnect the ECM harness connector. 3) Turn the ignition switch to ON. 4) Measure the voltage between harness connector terminal and chassis ground. Connector & terminal (B137) No. 14 (+) — Chassis ground (-):	Is the voltage more than 10 V?	Check poor contact in ECM connector.	<ul style="list-style-type: none"> • Check fuse No. 12 (in fuse & relay box). • Check the harness for open or short circuit between ignition switch and ECM.

F: DTC 22 AND 32 VEHICLE SPEED SENSOR

DIAGNOSIS:

Disconnection or short circuit of vehicle speed sensor system.

TROUBLE SYMPTOM:

Cruise control cannot be set. (Cancelled immediately.)

Step	Check	Yes	No
1 CHECK ABS WARNING LIGHT. 1) Turn the ignition switch to ON. 2) After the combination meter initial operation is completed, confirm that the ABS warning light continues to illuminate.	Does the ABS warning light continue to illuminate?	Check ABSCM or VDCCM <Ref. to ABS(diag)-2, Basic Diagnostic Procedure.> or <Ref. to VDC(diag)-2, Basic Diagnostic Procedure.>	Go to step 2.
2 CHECK LAN COMMUNICATION CIRCUIT ERROR DISPLAY. Check that the communication error is displayed on the odo/trip meter in combination meter.	Is the error code "Er xx" displayed on odo/trip meter?	Check the LAN communication circuit. <Ref. to LAN(diag)-2, Basic Diagnostic Procedure.>	Replace the ECM. <Ref. to FU(H4SO)-35, Engine Control Module (ECM).> <Ref. to FU(H4SO U5)-44, Engine Control Module (ECM).> <Ref. to FU(H4DOTC)-39, Engine Control Module (ECM).> <Ref. to FU(H6DO)-34, Engine Control Module (ECM).>

Basic Diagnostic Procedure

IMMOBILIZER (DIAGNOSTICS)

1. Basic Diagnostic Procedure

A: PROCEDURE

Step	Check	Yes	No
1 CHECK SECURITY INDICATOR LIGHT. 1) Turn the ignition switch to "OFF" or "ACC". 2) Wait for more than 60 seconds.	Does the security indicator light blink?	Go to step 2.	Check the security indicator light circuit. <Ref. to IM(diag)-11, CHECK SECURITY INDICATOR CIRCUIT, INSPECTION, Diagnostics Chart for Security Indicator Light.>
2 CHECK KEY SWITCH. Remove the key from ignition switch.	Does the security indicator light blink within 1 second after removing ignition key?	Go to step 3.	Check the key switch circuit. <Ref. to IM(diag)-13, CHECK KEY SWITCH CIRCUIT, INSPECTION, Diagnostics Chart for Security Indicator Light.>
3 CHECK SECURITY INDICATOR LIGHT. Turn the ignition switch to ON.	Does the security indicator light go off?	Go to step 5.	Go to step 4.
4 CHECK ENGINE START. Turn the ignition switch to START.	Does the starter operate?	Check the LAN communication circuit. <Ref. to LAN(diag)-2, Basic Diagnostic Procedure.>	Check the DTC display (body integrated unit). Go to step 7.
5 CHECK ENGINE START. Turn the ignition switch to START.	Does the starter operate?	Go to step 6.	Check the LAN communication circuit. <Ref. to LAN(diag)-2, Basic Diagnostic Procedure.>
6 CHECK ENGINE START. Turn the ignition switch to START.	Does the engine start?	Immobilizer system is OK.	Check the DTC display (ECM). Go to step 7.
7 CHECK ANY OTHER DTC ON DISPLAY. 1) Turn the ignition switch to OFF. 2) Connect the Subaru Select Monitor to data link connector. <Ref. to IM(diag)-7, Subaru Select Monitor.> 3) Turn the ignition switch and Subaru Select Monitor switch to ON. 4) Read DTC on display.	Is the DTC displayed on screen?	Go to step 8.	Repair the related parts.
8 PERFORM THE DIAGNOSIS. 1) Inspect using the "Diagnostic Procedure with Diagnostic Trouble Code (DTC)". <Ref. to IM(diag)-17, Diagnostic Procedure with Diagnostic Trouble Code (DTC).> 2) Repair the trouble cause. 3) Perform clear memory mode. 4) Read DTC again.	Is the DTC displayed on screen?	Inspect using the "Diagnostic Procedure with Diagnostic Trouble Code (DTC)". <Ref. to IM(diag)-17, Diagnostic Procedure with Diagnostic Trouble Code (DTC).>	Finish the diagnosis.

2. General Description

A: CAUTION

CAUTION:

- Airbag system wiring harnesses and connectors are yellow. Do not use the electrical test equipment on these circuits.
- Be careful not to damage the airbag system wiring harness.
- While diagnostic items are being checked, do not operate radios, portable telephones, etc. which emit electromagnetic waves near or inside the vehicle.

- When turning the ignition switch to ON or OFF while diagnostic items are being checked, do not allow keys with different ID codes close to the ignition switch. If the ignition key is in a key holder, remove it from the holder before carrying out diagnosis.

- When repeatedly turning the ignition switch to ON or OFF while diagnostic items are being checked, it should be switched in cycles of

“ON” for at least 5 seconds → “OFF” for at least 8 seconds.

- (1) Ignition switch position
- (2) Sec.

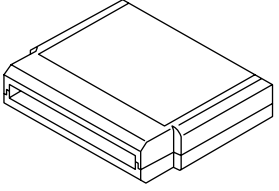

- If the engine fails to start with a registered ignition key, detach the ignition key from ignition switch and wait for approx. 1 second until security indicator light begins to flash. And then start the engine again.
- Before checking the diagnostic items, obtain all keys for the vehicle to be checked possessed by owner.

General Description

IMMOBILIZER (DIAGNOSTICS)

B: PREPARATION TOOL

1. SPECIAL TOOL

ILLUSTRATION	TOOL NUMBER	DESCRIPTION	REMARKS
 ST24082AA260	24082AA260	CARTRIDGE	Troubleshooting for electrical system.
 ST22771AA030	22771AA030	SUBARU SELECT MONITOR KIT	Troubleshooting for electrical system.

2. GENERAL TOOL

TOOL NAME	REMARKS
Circuit tester	Used for measuring resistance, voltage and ampere.

3. Electrical Component Location

A: LOCATION

IM-00108

(1) Antenna

(3) Body integrated unit

(4) Transponder

(2) Security indicator light (LED bulb)

Immobilizer Control Module I/O Signal

IMMOBILIZER (DIAGNOSTICS)

4. Immobilizer Control Module I/O Signal

A: WIRING DIAGRAM

1. IMMOBILIZER

<Ref. to WI-124, WIRING DIAGRAM, Immobilizer System.>

5. Subaru Select Monitor

A: OPERATION

1. HOW TO USE SUBARU SELECT MONITOR

1) Prepare the Subaru Select Monitor kit.

2) Connect the diagnosis cable to Subaru Select Monitor.

3) Insert the cartridge to Subaru Select Monitor.

4) Connect the Subaru Select Monitor to data link connector.

(1) Data link connector is located in the lower portion of the instrument panel (on the driver's side).

(2) Connect the diagnosis cable to data link connector.

CAUTION:

Do not connect the scan tools except for Subaru Select Monitor.

5) Turn the ignition switch to ON (engine OFF), and the Subaru Select Monitor switch to ON.

(1) Power switch

6) Using the Subaru Select Monitor, call up DTCs and various data, then record them.

2. READ DIAGNOSTIC TROUBLE CODE (DTC) FOR ENGINE AND BODY INTEGRATED UNIT

Refer to Read Diagnostic Trouble Code for information about how to indicate DTC. <Ref. to IM(diag)-9, Read Diagnostic Trouble Code (DTC).>

3. COMMUNICATION LINE CHECK

NOTE:

The communication line between ECM and body integrated module can be checked in "System Operation Check Mode". This is referred to as "Communication line check".

- 1) Connect the Subaru Select Monitor.
- 2) On the «Main Menu» display screen, select the {Each System Check} and press the [YES] key.
- 3) On the «System Selection Menu» display screen, select the {Engine} and press the [YES] key.
- 4) Press the [Yes] key after the information of engine type has been displayed.
- 5) On the «Engine Diagnosis» display screen, select the {System Operation Check Mode} and press the [YES] key.
- 6) On the «System operation check mode» display, select the {security system}.
- 7) Start the communication line check.
- 8) Is «Communication Line not Shorted» displayed on screen?
If displayed, go to step 9).
If "NO", go to step 10).
- 9) After diagnostic results, it is determined that the circuit is not shorted. Finish the communication line check.

Subaru Select Monitor

IMMOBILIZER (DIAGNOSTICS)

10) If a problem is detected, repair the trouble cause. <Ref. to IM(diag)-21, DTC P1572 IMM CIRCUIT FAILURE (EXCEPT ANTENNA CIRCUIT), Diagnostic Procedure with Diagnostic Trouble Code (DTC).>

6. Read Diagnostic Trouble Code (DTC)

A: OPERATION

1. ECM

- 1) On the «Main Menu» display screen, select the {Each System Check} and press the [YES] key.
- 2) On the «System Selection Menu» display screen, select the {Engine Control System} and press the [YES] key.
- 3) Press the [YES] key after the information of engine type is displayed.
- 4) On the «Engine Diagnosis» display screen, select the {Diagnostic Code(s) Display}, and then press the [YES] key.
- 5) On the «Diagnostic Code(s) Display» display screen, select the {Current Diagnostic Code(s)} or {History Diagnostic Code(s)}, and then press the [YES] key.

NOTE:

- For detailed operation procedure, refer to the SUBARU SELECT MONITOR OPERATION MANUAL.
- For detailed concerning DTC, refer to the List of DTC. <Ref. to IM(diag)-15, LIST, List of Diagnostic Trouble Code (DTC).>

2. BODY INTEGRATED UNIT

- 1) On the «Main Menu» display screen, select the {Each System Check} and press the [YES] key.
- 2) On the «System Selection Menu» display screen, select the {Integ. unit mode} and press the [YES] key.
- 3) Press the [YES] key after the {Integ. unit mode} is displayed.
- 4) On the «Integ. unit mode failure diag» display screen, select the {Diagnostic Code(s) Display} and press the [YES] key.

NOTE:

- For detailed operation procedure, refer to the SUBARU SELECT MONITOR OPERATION MANUAL.
- For detailed concerning DTC, refer to the List of DTC. <Ref. to IM(diag)-15, LIST, List of Diagnostic Trouble Code (DTC).>

7. Clear Memory Mode

A: OPERATION

1. ECM

- 1) On the «Main Menu» display screen, select the {Each System Check} and press the [YES] key.
- 2) On the «System Selection Menu» display screen, select the {Engine Control System} and press the [YES] key.
- 3) Press the [YES] key after the information of engine type is displayed.
- 4) On the «Engine Diagnosis» display screen, select the {Clear Memory} and press the [YES] key.
- 5) When the 'Done' are shown on the display screen, turn the Subaru Select Monitor and ignition switch to OFF.

NOTE:

- After the memory has been cleared, the idle air control solenoid valve must be initialized. To execute this procedure, turn the ignition switch to ON. Wait 3 seconds before starting the engine.
- For detailed operation procedure, refer to the SUBARU SELECT MONITOR OPERATION MANUAL.

2. BODY INTEGRATED UNIT

- 1) On the «Main Menu» display screen, select the {Each System Check} and press the [YES] key.
- 2) On the «System Selection Menu» display screen, select the {Integ. unit mode} and press the [YES] key.
- 3) Press the [YES] key after the {Integ. unit mode} is displayed.
- 4) On the «Integ. unit mode failure diag» display screen, select the {Clear Memory} and press the [YES] key.
- 5) When the 'Done' are shown on the display screen, turn the Subaru Select Monitor and ignition switch to OFF.

NOTE:

For detailed operation procedure, refer to the SUBARU SELECT MONITOR OPERATION MANUAL.

Diagnostics Chart for Security Indicator Light

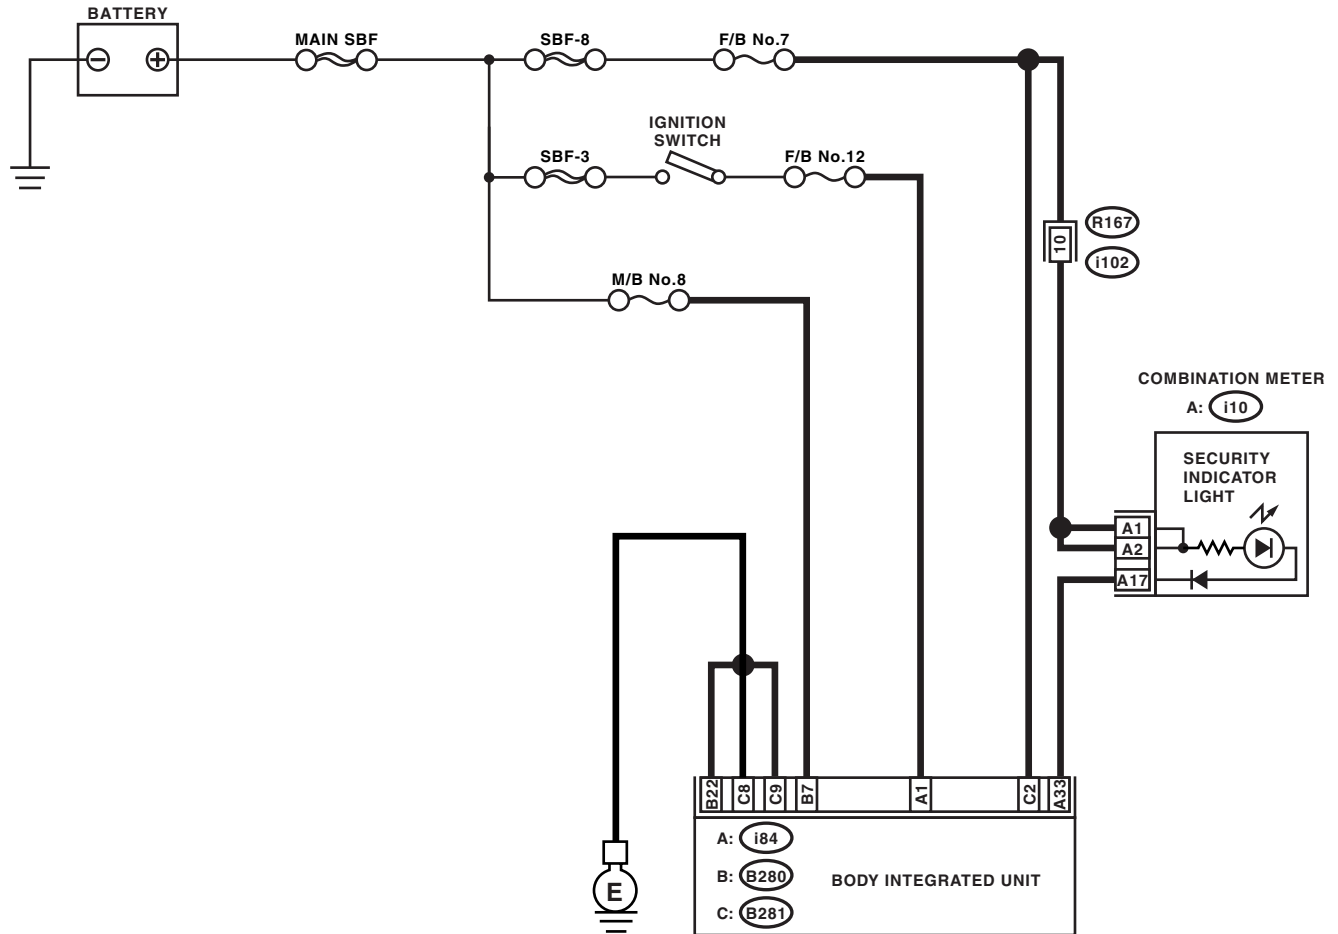

IMMOBILIZER (DIAGNOSTICS)

8. Diagnostics Chart for Security Indicator Light

A: INSPECTION

1. CHECK SECURITY INDICATOR CIRCUIT

WIRING DIAGRAM:

IM-00109

Diagnostics Chart for Security Indicator Light

IMMOBILIZER (DIAGNOSTICS)

Step	Check	Yes	No
1 CHECK SECURITY INDICATOR LIGHT. 1) Turn the ignition switch to OFF. 2) Disconnect the harness connector from body integrated unit. 3) Connect the resistor (100 Ω) between body integrated unit harness connector terminal (i84) No. 33 and chassis ground.	Does the security indicator light illuminate?	Go to step 2.	Go to step 5.
2 CHECK BODY INTEGRATED UNIT GROUND CIRCUIT. Measure the resistance between body integrated unit harness connector terminal and chassis ground. <i>Connector & terminal</i> <i>(B280) No. 22 — Chassis ground:</i> <i>(B281) No. 8, No. 9 — Chassis ground:</i>	Is the resistance less than 10 Ω?	Go to step 3.	Repair the open circuit of body integrated unit ground circuit.
3 CHECK BODY INTEGRATED UNIT IGNITION CIRCUIT. 1) Turn the ignition switch to ON. (engine OFF) 2) Measure the voltage between body integrated unit harness connector terminal and chassis ground. <i>Connector & terminal</i> <i>(i84) No. 1 (+) — Chassis ground (-):</i>	Is the voltage more than 10 V?	Go to step 4.	Check the harness for open or short circuit between body integrated unit and ignition switch.
4 CHECK BODY INTEGRATED UNIT POWER SUPPLY CIRCUIT. 1) Turn the ignition switch to OFF. 2) Measure the voltage between body integrated unit harness connector terminal and chassis ground. <i>Connector & terminal</i> <i>(B280) No. 7 (+) — Chassis ground (-):</i> <i>(B281) No. 2 (+) — Chassis ground (-):</i>	Is the voltage more than 10 V?	Replace the body integrated unit <Ref. to SL-54, Body Integrated Unit.> and replace the all ignition keys (including transponder). Execute the registration procedure next. Refer to “REGISTRATION MANUAL FOR IMMOBILIZER”.	Check the harness for open or short circuit between body integrated unit and fuse.
5 CHECK COMBINATION METER CIRCUIT. 1) Remove the combination meter. <Ref. to IDI-15, Combination Meter.> 2) Measure the voltage between the combination meter harness connector terminal and chassis ground. <i>Connector & terminal</i> <i>(i10) No. 1, No. 2 (+) — Chassis ground (-):</i>	Is the voltage more than 10 V?	Go to step 6.	Check the harness for open or short circuit between combination meter and fuse.
6 CHECK COMBINATION METER CIRCUIT. Measure the resistance between body integrated unit harness connector terminal and combination meter harness connector terminal. <i>Connector & terminal</i> <i>(i84) No. 33 — (i10) No. 17:</i>	Is the resistance less than 10 Ω?	LED bulb malfunction. Replace the combination meter case assembly. <Ref. to IDI-16, DISASSEMBLY, Combination Meter.>	Repair the harness/connector.

Diagnostics Chart for Security Indicator Light

IMMOBILIZER (DIAGNOSTICS)

2. CHECK KEY SWITCH CIRCUIT

WIRING DIAGRAM:

IM-00078

Diagnostics Chart for Security Indicator Light

IMMOBILIZER (DIAGNOSTICS)

Step	Check	Yes	No
1 CHECK POWER SUPPLY CIRCUIT. 1) Disconnect the harness connector from key warning switch. 2) Turn the ignition switch to "ACC" or "LOCK" (with key inserted). 3) Measure the voltage between key warning switch harness connector terminal and chassis ground. <i>Connector & terminal</i> <i>(B350) No. 3 (+) — Chassis ground (-):</i>	Is the voltage more than 10 V?	Go to step 2.	Check the harness for open or short circuit between key warning switch and fuse.
2 CHECK KEY WARNING SWITCH. 1) Insert the ignition key to ignition switch. (OFF or ACC) 2) Measure the resistance between key warning switch terminals. <i>Connector & terminal</i> <i>No. 3 — No. 4:</i>	Is the resistance less than 1 Ω ?	Go to step 3.	Replace the key warning switch.
3 CHECK KEY WARNING SWITCH. 1) Remove the ignition key from ignition switch. 2) Measure the resistance between key warning switch terminals. <i>Connector & terminal</i> <i>No. 3 — No. 4:</i>	Is the resistance more than 1 $M\Omega$?	Go to step 4.	Replace the key warning switch.
4 CHECK HARNESS BETWEEN KEY WARNING SWITCH AND BODY INTEGRATED UNIT. 1) Disconnect the harness connector from key warning switch. 2) Disconnect the harness connector from body integrated unit. 3) Measure the resistance between key warning switch harness connector terminal and body integrated unit harness connector terminal. <i>Connector & terminal</i> <i>(B350) No. 4 — (B281) No. 7:</i>	Is the resistance less than 10 Ω ?	Replace the body integrated unit <Ref. to SL-54, Body Integrated Unit.> and replace the all ignition keys (including transponder). Execute the registration procedure next. Refer to "REGISTRATION MANUAL FOR IMMOBILIZER".	Repair the harness between key warning switch and body integrated unit.

List of Diagnostic Trouble Code (DTC)

IMMOBILIZER (DIAGNOSTICS)

9. List of Diagnostic Trouble Code (DTC)

A: LIST

1. ECM

DTC	Item	Contents of diagnosis	Index No.
P0513	Incorrect Immobilizer Key	Incorrect immobilizer key (Use of unregistered key in body integrated unit)	<Ref. to IM(diag)-17, DTC P0513 INCORRECT IMMOBILIZER KEY, Diagnostic Procedure with Diagnostic Trouble Code (DTC).>
P1570	ANTENNA	Faulty antenna	<Ref. to IM(diag)-18, DTC P1570 ANTENNA, Diagnostic Procedure with Diagnostic Trouble Code (DTC).>
P1571	Reference Code Incompatibility	Reference code incompatibility between body integrated unit and ECM	<Ref. to IM(diag)-20, DTC P1571 REFERENCE CODE INCOMPATIBILITY, Diagnostic Procedure with Diagnostic Trouble Code (DTC).>
P1572	EGI — Immobilizer Communication (Except Antenna Circuit)	Communication failure between body integrated unit and ECM	<Ref. to IM(diag)-21, DTC P1572 IMM CIRCUIT FAILURE (EXCEPT ANTENNA CIRCUIT), Diagnostic Procedure with Diagnostic Trouble Code (DTC).>
P1574	Key — Immobilizer Communication	Failure of body integrated unit to verify key (transponder) ID code	<Ref. to IM(diag)-24, DTC P1574 KEY COMMUNICATION FAILURE, Diagnostic Procedure with Diagnostic Trouble Code (DTC).>
P1576	EGI Control Module EEPROM	ECM malfunctioning	<Ref. to IM(diag)-24, DTC P1576 EGI CONTROL MODULE EEPROM, Diagnostic Procedure with Diagnostic Trouble Code (DTC).>
P1577	IMM Control Module EEPROM	Body integrated unit malfunctioning	<Ref. to IM(diag)-24, DTC P1577 IMM CONTROL MODULE EEPROM, Diagnostic Procedure with Diagnostic Trouble Code (DTC).>
P1578	Meter malfunctioning	Reference code incompatibility between body integrated unit and combination meter	<Ref. to IM(diag)-25, DTC P1578 METER FAILURE, Diagnostic Procedure with Diagnostic Trouble Code (DTC).>

NOTE:

Perform the engine DTC when the DTC except for immobilizer DTC is detected.

<Ref. to EN(H4DOTC)(diag)-71, List of Diagnostic Trouble Code (DTC).> <Ref. to EN(H6DO)(diag)-71, List of Diagnostic Trouble Code (DTC).>

List of Diagnostic Trouble Code (DTC)

IMMOBILIZER (DIAGNOSTICS)

2. BODY INTEGRATED UNIT

DTC	Item	Contents of diagnosis	Index No.	Relation between ECM and DTC
B0401	M collation NG	Reference code incompatibility between body integrated unit and combination meter	<Ref. to IM(diag)-25, DTC P1578 METER FAILURE, Diagnostic Procedure with Diagnostic Trouble Code (DTC).>	P1578
B0402	Immobilizer Key collation NG	<ul style="list-style-type: none"> • Incorrect immobilizer key (Use of unregistered key in body integrated unit) • Faulty antenna 	<Ref. to IM(diag)-17, DTC P0513 INCORRECT IMMOBILIZER KEY, Diagnostic Procedure with Diagnostic Trouble Code (DTC).> <Ref. to IM(diag)-18, DTC P1570 ANTENNA, Diagnostic Procedure with Diagnostic Trouble Code (DTC).> or <Ref. to IM(diag)-24, DTC P1574 KEY COMMUNICATION FAILURE, Diagnostic Procedure with Diagnostic Trouble Code (DTC).>	<ul style="list-style-type: none"> • P0513 • P1570 • P1574
B0403	E/G request NG	Communication failure between body integrated unit and ECM	<Ref. to IM(diag)-21, DTC P1572 IMM CIRCUIT FAILURE (EXCEPT ANTENNA CIRCUIT), Diagnostic Procedure with Diagnostic Trouble Code (DTC).>	P1572

NOTE:

- Immobilizer system perform the starter relay control. When the body integrated unit detect the inconformity of reference code, immediately out put the starter relay cut signal to ECM, and then ECM stop the starter relay operation. In this case, engine does not start, and DTC is not recorded in ECM. Check that the engine does not start on the DTC of body integrated unit.
- DTC B0401 and B0402 is recorded as freeze frame data when the ignition switch is turned to OFF. When trying to start the engine with unregistered immobilizer key, DTC is not displayed on Subaru Select Monitor immediately. Turn the ignition switch to OFF once and turn to ON again before checking DTC. At this time (when turning the ignition switch to ON again), be careful that the DTC is displayed as freeze frame data even with the registered immobilizer key.

10. Diagnostic Procedure with Diagnostic Trouble Code (DTC)

A: DTC P0513 INCORRECT IMMOBILIZER KEY

DTC DETECTING CONDITION:

Incorrect immobilizer key (Use of unregistered key in body integrated unit)

	Step	Check	Yes	No
1	PERFORM TEACHING OPERATION ON IGNITION KEY. Perform teaching operation on all keys of the vehicle. Refer to "REGISTRATION MANUAL FOR IMMOBILIZER".	Is the teaching operation for all keys completed?	END.	Replace the ignition keys (including transponder) which cannot be registered. Go to step 2.
2	PERFORM TEACHING OPERATION ON IGNITION KEY. Perform teaching operation on all keys of the vehicle. Refer to "REGISTRATION MANUAL FOR IMMOBILIZER".	Is the teaching operation for all keys completed?	END.	Replace the body integrated unit <Ref. to SL-54, Body Integrated Unit.> and replace all the ignition keys (including transponder). Execute the registration procedure next. Refer to "REGISTRATION MANUAL FOR IMMOBILIZER".

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

IMMOBILIZER (DIAGNOSTICS)

B: DTC P1570 ANTENNA

DTC DETECTING CONDITION:

Faulty antenna

WIRING DIAGRAM:

B351

20	21	22	23	24	25	26	27	28			

IM-00110

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

IMMOBILIZER (DIAGNOSTICS)

Step	Check	Yes	No
1 CHECK ANTENNA CIRCUIT. 1) Turn the ignition switch to OFF. 2) Disconnect the harness connector from antenna. <Ref. to SL-57, Immobilizer Antenna.> 3) Measure the resistance of antenna circuit. Connector & terminal (B351) No. 1 — No. 2:	Is the resistance less than 10 Ω ?	Go to step 2.	Replace the antenna. <Ref. to SL-57, Immobilizer Antenna.>
2 CHECK ANTENNA CIRCUIT. 1) Disconnect the harness connector from body integrated unit. 2) Measure the resistance between harness connector and chassis ground. Connector & terminal (B281) No. 21 — Chassis ground:	Is the resistance less than 10 Ω ?	Repair the harness.	Go to step 3.
3 CHECK ANTENNA CIRCUIT. Measure the resistance between harness connector and chassis ground. Connector & terminal (B281) No. 20 — Chassis ground:	Is the resistance less than 10 Ω ?	Repair the harness.	Go to step 4.
4 CHECK ANTENNA CIRCUIT. 1) Turn the ignition switch to ON. (engine OFF) 2) Measure the voltage between harness connector and chassis ground. Connector & terminal (B281) No. 21 (+) — Chassis ground (-):	Is the voltage 0 V?	Go to step 5.	Repair the harness.
5 CHECK ANTENNA CIRCUIT. Measure the voltage between harness connector and chassis ground. Connector & terminal (B281) No. 20 (+) — Chassis ground (-):	Is the voltage 0 V?	Go to step 6.	Repair the harness between body integrated unit and antenna, because there is short circuit with battery voltage line or ignition switch "ON" line.
6 CHECK BODY INTEGRATED UNIT FUNCTION. 1) Turn the ignition switch to OFF. 2) Connect the harness connector to body integrated unit. 3) Insert the key to ignition switch, and measure the changes in voltage between antenna harness connectors. Connector & terminal (B281) No. 20 (+) — Chassis ground (-):	Is the voltage -30 to 30 V? (Approx. 0.1 second after inserting the key) Is the voltage 0 V? (Approx. 1 second after inserting the key)	Go to step 7.	Replace the body integrated unit <Ref. to SL-54, Body Integrated Unit.> and replace all the ignition keys (including transponder). Execute the registration procedure next. Refer to "REGISTRATION MANUAL FOR IMMOBILIZER".

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

IMMOBILIZER (DIAGNOSTICS)

Step	Check	Yes	No
7 CHECK IGNITION KEY (TRANSPONDER). 1) Remove the key from ignition switch. 2) Start the engine using other keys that have undergone the teaching operation, furnished with vehicle.	Does the engine start?	Replace all the ignition keys (including transponder). Execute the registration procedure next. Refer to "REGISTRATION MANUAL FOR IMMOBILIZER".	Replace the body integrated unit <Ref. to SL-54, Body Integrated Unit.> and replace the all ignition keys (including transponder). Execute the registration procedure next. Refer to "REGISTRATION MANUAL FOR IMMOBILIZER".

C: DTC P1571 REFERENCE CODE INCOMPATIBILITY

DTC DETECTING CONDITION:

Reference code incompatibility between body integrated unit and ECM

Step	Check	Yes	No
1 PERFORM TEACHING OPERATION ON IGNITION KEY. Perform teaching operation on all keys of the vehicle. Refer to "REGISTRATION MANUAL FOR IMMOBILIZER".	Is the teaching operation for all keys completed?	END.	Go to step 2.
2 CHECK ANY OTHER DTC ON DISPLAY.	Is any other immobilizer DTC displayed?	Inspect relevant DTC using "List of Diagnostic Trouble Code (DTC)" <Ref. to IM(diag)-15, List of Diagnostic Trouble Code (DTC).> Execute the registration procedure next. Refer to "REGISTRATION MANUAL FOR IMMOBILIZER".	Replace the ECM. <Ref. to FU(H4DOTC)-39, Engine Control Module (ECM).> <Ref. to FU(H6DO)-34, Engine Control Module (ECM).> Replace the body integrated unit <Ref. to SL-54, Body Integrated Unit.> and replace all the ignition keys (including transponder). Execute the registration procedure next. Refer to "REGISTRATION MANUAL FOR IMMOBILIZER".

D: DTC P1572 IMM CIRCUIT FAILURE (EXCEPT ANTENNA CIRCUIT)

DTC DETECTING CONDITION:

Communication failure between body integrated unit and ECM

WIRING DIAGRAM:

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

IMMOBILIZER (DIAGNOSTICS)

Step	Check	Yes	No
1 CHECK BODY INTEGRATED UNIT POWER SUPPLY CIRCUIT. 1) Turn the ignition switch to OFF. 2) Disconnect the harness connector from body integrated unit. 3) Measure the voltage between body integrated unit harness connector terminal and chassis ground. <i>Connector & terminal</i> <i>(B280) No. 7 (+) — Chassis ground (-):</i> <i>(B281) No. 2 (+) — Chassis ground (-):</i>	Is the voltage more than 10 V?	Go to step 2.	Check the harness for open or short circuit between body integrated unit and fuse.
2 CHECK BODY INTEGRATED UNIT POWER SUPPLY CIRCUIT. 1) Turn the ignition switch to ON. (engine OFF) 2) Measure the voltage between body integrated unit harness connector terminal and chassis ground. <i>Connector & terminal</i> <i>(i84) No. 1 (+) — Chassis ground (-):</i>	Is the voltage more than 10 V?	Go to step 3.	Check the harness for open or short circuit between body integrated unit and ignition switch.
3 CHECK BODY INTEGRATED UNIT GROUND CIRCUIT. 1) Turn the ignition switch to OFF. 2) Measure the resistance between body integrated unit harness connector terminal and chassis ground. <i>Connector & terminal</i> <i>(B280) No. 22 — Chassis ground:</i> <i>(B281) No. 8, No. 9 — Chassis ground:</i>	Is the resistance less than 10 Ω ?	Go to step 4.	Repair the open circuit of body integrated unit ground circuit.
4 CHECK HARNESS BETWEEN BODY INTEGRATED UNIT AND ECM. 1) Disconnect the harness connector from body integrated unit and ECM. 2) Measure the resistance between body integrated unit harness connector terminal and ECM connector terminal. <i>Connector & terminal</i> <i>(B280) No. 18 — (B137) No. 19:</i>	Is the resistance less than 10 Ω ?	Go to step 5.	Repair the open circuit of harness between body integrated unit and ECM.
5 CHECK HARNESS BETWEEN BODY INTEGRATED UNIT AND ECM. Measure the resistance between body integrated unit harness connector terminal and ECM connector terminal. <i>Connector & terminal</i> <i>(B280) No. 28 — (B137) No. 27:</i>	Is the resistance less than 10 Ω ?	Go to step 6.	Repair the open circuit of harness between body integrated unit and ECM.
6 CHECK HARNESS OF COMMUNICATION LINE. 1) Turn the ignition switch to ON. (engine OFF) 2) Measure the voltage between body integrated unit harness connector terminal and chassis ground. <i>Connector & terminal</i> <i>(B280) No. 18, No. 28 (+) — Chassis ground (-):</i>	Is the voltage 0 V?	Go to step 7.	Repair the harness between body integrated unit and ECM, because there is short circuit with battery voltage line or ignition switch "ON" line.

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

IMMOBILIZER (DIAGNOSTICS)

Step	Check	Yes	No
<p>7</p> <p>CHECK HARNESS OF COMMUNICATION LINE. Measure the voltage between harness connector terminal and engine ground. Connector & terminal (B137) No. 19, No. 27 (+) — Engine ground (-):</p>	<p>Is the voltage 0 V?</p>	<p>Go to step 8.</p>	<p>Repair the harness between body integrated unit and ECM, because there is short circuit with battery voltage line or ignition switch "ON" line.</p>
<p>8</p> <p>CHECK ECM BY COMMUNICATION LINE CHECK. 1) Connect the harness connector to ECM. 2) Disconnect the harness connector from body integrated unit. 3) Start the communication line check. <Ref. to IM(diag)-7, COMMUNICATION LINE CHECK, OPERATION, Subaru Select Monitor.></p>	<p>Does "Communication Line not Shorted" appear on the screen?</p>	<p>Replace the body integrated unit <Ref. to SL-54, Body Integrated Unit.> and replace the all ignition keys (including transponder). Execute the registration procedure next. Refer to "REGISTRATION MANUAL FOR IMMOBILIZER".</p>	<p>Replace the ECM. <Ref. to FU(H4DOTC)-39, Engine Control Module (ECM).> <Ref. to FU(H6DO)-34, Engine Control Module (ECM).> Perform the registration procedure next. Refer to "REGISTRATION MANUAL FOR IMMOBILIZER".</p>

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

IMMOBILIZER (DIAGNOSTICS)

E: DTC P1574 KEY COMMUNICATION FAILURE

DTC DETECTING CONDITION:

Failure of body integrated unit to verify key (transponder) ID code

Step	Check	Yes	No
1 CHECK BODY INTEGRATED UNIT FUNCTION. Insert the key to ignition switch (LOCK position), and measure the changes in voltage between antenna connectors. Connector & terminal (B351) No. 1 (+) — Chassis ground (-):	Is the voltage -30 to 30 V? (Approx. 0.1 second after inserting the key) Is the voltage 0 V? (Approx. 1 second after inserting the key)	Go to step 2.	Replace the body integrated unit <Ref. to SL-54, Body Integrated Unit.> and replace the all ignition keys (including transponder). Execute the registration procedure next. Refer to "REGISTRATION MANUAL FOR IMMOBILIZER".
2 CHECK IGNITION KEY (TRANSPONDER). 1) Remove the key from ignition switch. 2) Start the engine using other keys that have undergone the teaching operation, furnished with vehicle.	Does the engine start?	Replace all the ignition keys (including transponder). Execute the registration procedure next. Refer to "REGISTRATION MANUAL FOR IMMOBILIZER".	Replace the body integrated unit <Ref. to SL-54, Body Integrated Unit.> and replace the all ignition keys (including transponder). Execute the registration procedure next. Refer to "REGISTRATION MANUAL FOR IMMOBILIZER".

F: DTC P1576 EGI CONTROL MODULE EEPROM

DTC DETECTING CONDITION:

ECM malfunctioning

1. REPLACE ECM

Replace the ECM. <Ref. to FU(H4DOTC)-39, Engine Control Module (ECM).> <Ref. to FU(H6DO)-34, Engine Control Module (ECM).>

Perform the registration procedure next. Refer to "REGISTRATION MANUAL FOR IMMOBILIZER".

G: DTC P1577 IMM CONTROL MODULE EEPROM

DTC DETECTING CONDITION:

Body integrated unit malfunctioning

1. REPLACE BODY INTEGRATED UNIT

Replace the body integrated unit <Ref. to SL-54, Body Integrated Unit.> and replace the all ignition keys (including transponder). Execute the registration procedure next. Refer to "REGISTRATION MANUAL FOR IMMOBILIZER".

H: DTC P1578 METER FAILURE

DTC DETECTING CONDITION:

Reference code incompatibility between body integrated unit and combination meter

1. CHECK LAN COMMUNICATION SYSTEM

Inspect LAN communication system in the following situation. <Ref. to LAN(diag)-2, Basic Diagnostic Procedure.>

- DTC of body integrated unit B0300, B0301, B0302, B0111 or B0321 is displayed.
- “Er IU” or “Er LC” is displayed in odo/trip meter on combination meter.

2. REPLACE COMBINATION METER

Replace the combination meter. <Ref. to IDI-15, REMOVAL, Combination Meter.> Execute the registration procedure of all immobilizer part (combination meter and etc.) next. Refer to “REGISTRATION MANUAL FOR IMMOBILIZER”.

NOTE:

When the combination meter has been replaced, be sure to perform the registration procedure of immobilizer.

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

IMMOBILIZER (DIAGNOSTICS)

Basic Diagnostic Procedure

LAN SYSTEM (DIAGNOSTICS)

1. Basic Diagnostic Procedure

A: PROCEDURE

1. WITH SUBARU SELECT MONITOR

CAUTION:

- Subaru Select Monitor is required for reading DTC, performing diagnosis and reading current data.
- Remove foreign matter (dust, water and oil etc.) from the body integrated unit connector during removal and installation.
- For the model with immobilizer, registration of immobilizer may be needed after the replacement of controller and etc. For detail procedure, refer to “REGISTRATION MANUAL FOR IMMOBILIZER”.

NOTE:

- To check harness for broken wires or short circuits, shake the problem part or connector.
- Check List for Interview <Ref. to LAN(diag)-3, Check List for Interview.>

Step	Check	Yes	No
1 CHECK PRE-INSPECTION. 1) Ask the customer when and how the trouble occurred using interview check list. <Ref. to LAN(diag)-3, Check List for Interview.> 2) Check the display of communication error display. (Combination meter, odo/trip meter)	Is communication error displayed?	Go to step 3	Go to step 2
2 BASIC INSPECTION. Check the components which might affect body control. <Ref. to LAN(diag)-5, INSPECTION, General Description.>	Is the component that might influence the body control problem normal?	Go to step 3	Repair or replace each unit.
3 CHECK INDICATION OF DTC. 1) Read the DTC. <Ref. to LAN(diag)-14, READ DIAGNOSTIC TROUBLE CODE (DTC), OPERATION, Subaru Select Monitor.> NOTE: If the communication function of the Subaru Select Monitor cannot be executed normally, check the communication circuit. <Ref. to LAN(diag)-30, COMMUNICATION FOR INITIALIZING IMPOSSIBLE, Diagnostic Procedure with Diagnostic Trouble Code (DTC).> 2) Record all DTCs.	Is DTC displayed?	Go to step 5	Go to step 4
4 PERFORM THE GENERAL DIAGNOSTICS. Inspect using “General Diagnostics Table”. <Ref. to LAN(diag)-81, General Diagnostic Table.>	Is the result of inspection OK?	LAN system is normal.	Go to step 5
5 PERFORM THE DIAGNOSIS. 1) Fix the wrong part. 2) Perform the clear memory mode. <Ref. to LAN(diag)-20, CLEAR MEMORY MODE, OPERATION, Subaru Select Monitor.> 3) Read DTC. <Ref. to LAN(diag)-14, READ DIAGNOSTIC TROUBLE CODE (DTC), OPERATION, Subaru Select Monitor.>	Is DTC displayed?	Repeat step 5 until DTC is not shown.	Finish the diagnosis.

2. Check List for Interview

A: CHECK

Inspect the following items about the vehicle's state.

1. DISPLAY OF COMMUNICATION ERROR

Communication error is displayed in odo/trip meter.	When and how often are they displayed? <input type="checkbox"/> Always <input type="checkbox"/> Sometimes <input type="checkbox"/> Only once
	Which communication error is displayed? (Record them all) <input type="checkbox"/> Er IU (Fail in the body integrated unit) <input type="checkbox"/> Er HC (Fail of high-speed CAN) <input type="checkbox"/> Er LC (Fail of low-speed CAN) <input type="checkbox"/> Er — (Fails of both high-speed and low-speed CAN) <input type="checkbox"/> Er EG (Fail of EGI communication counter) <input type="checkbox"/> Er TC (Fail of TCM communication counter) <input type="checkbox"/> Er Ab (Fail of vehicle dynamics control (VDC)/ABS communication counter)
Ignition key position	<input type="checkbox"/> OFF <input type="checkbox"/> ACC <input type="checkbox"/> ON (before starting engine) <input type="checkbox"/> START <input type="checkbox"/> ON (after Engine starting, engine is running) <input type="checkbox"/> ON (after Engine starting, engine is at a standstill)
Timing	<input type="checkbox"/> Immediately after turning the ignition to ON <input type="checkbox"/> Immediately after turning the ignition to START

2. DISPLAY IN COMBINATION METER

Display in combination meter	a) Display of temperature gauge	<input type="checkbox"/> OK / <input type="checkbox"/> NG
	b) Display of fuel gauge	<input type="checkbox"/> OK / <input type="checkbox"/> NG
Display of other indicators	c) Malfunction indicator light	<input type="checkbox"/> ON / <input type="checkbox"/> OFF
	d) SPORT indicator light (AT warning light)	<input type="checkbox"/> ON / <input type="checkbox"/> OFF
	e) ABS warning light/Vehicle dynamics control (VDC) warning light	<input type="checkbox"/> ON / <input type="checkbox"/> OFF
	f) Security indicator light	<input type="checkbox"/> ON / <input type="checkbox"/> Blink / <input type="checkbox"/> OFF
	g) Seat belt warning light (Driver's seat)	<input type="checkbox"/> ON / <input type="checkbox"/> OFF
	h) Seat belt warning light (Passenger's seat)	<input type="checkbox"/> ON / <input type="checkbox"/> OFF

3. SYMPTOMS

Behavior of vehicle	a) Illumination volume control is not available.	<input type="checkbox"/> Yes / <input type="checkbox"/> No
	b) Rear wiper does not operate.	<input type="checkbox"/> Yes / <input type="checkbox"/> No
	c) Wiper deicer does not operate.	<input type="checkbox"/> Yes / <input type="checkbox"/> No
	d) Rear defogger does not operate.	<input type="checkbox"/> Yes / <input type="checkbox"/> No
	e) Door lock does not operate.	<input type="checkbox"/> Yes / <input type="checkbox"/> No
	f) Trunk/rear gate lock does not operate	<input type="checkbox"/> Yes / <input type="checkbox"/> No
	g) Driver's door lock does not operate.	<input type="checkbox"/> Yes / <input type="checkbox"/> No
	h) Shift lock does not operate.	<input type="checkbox"/> Yes / <input type="checkbox"/> No
	i) Key illumination blinks.	<input type="checkbox"/> Yes / <input type="checkbox"/> No

Check List for Interview

LAN SYSTEM (DIAGNOSTICS)

4. CONDITIONS UNDER WHICH TROUBLE OCCURS

Driving condition	<input type="checkbox"/> At standstill (While idling)
	<input type="checkbox"/> When the vehicle is running Vehicle speed km/h (MPH)
	<input type="checkbox"/> When accelerating Acceleration km/h (MPH) to km/h (MPH)
	<input type="checkbox"/> Decelerating (With braking) Deceleration km/h (MPH) to km/h (MPH)
	<input type="checkbox"/> Decelerating (Without braking) Deceleration km/h (MPH) to km/h (MPH)
	<input type="checkbox"/> Flat road
	<input type="checkbox"/> Uphill
	<input type="checkbox"/> Downhill
	<input type="checkbox"/> Gravel road
	<input type="checkbox"/> Bumpy road
	<input type="checkbox"/> Snowy road
	Does it occur when operating any part? Operated part: Trouble Symptom:
	Are other troubles occurred? From where: Trouble Symptom:

3. General Description

A: CAUTION

1. SRS AIRBAG SYSTEM

Airbag system wiring harness is routed near the body integrated unit and twisted pair line.

CAUTION:

- All airbag system wiring harness and connectors are colored yellow. Do not use the electrical test equipment on these circuits.
- Be careful not to damage the Airbag system wiring harness when servicing the body integrated unit and LAN system.

2. LAN SYSTEM

- Bus line of LAN system is twisted pair line. Be careful not to bypass or partly unbind the twisted pair line.
- Do not make clearance between bus lines (CAN High, CAN Low).
- Difference of bus line length should be within 10 cm (3.94 in).
- Fray near the connector should be within 8 cm (3.14 in).

(A) Bypass wire connection

- If the characteristics of the twisted pair line is changed, it may cause extremely weakness to the noise.

- When repairing the harness, connect the wires using soldering and protect it with insulating tape, etc.

(A) Soldering and protection with insulating tape

B: INSPECTION

Before performing diagnostics, check the following items which might affect body integrated unit malfunctions.

- 1) Measure the battery voltage and check electrolyte.

Standard voltage: 12 V, or more

Specific gravity: Above 1.260

- 2) Check the fuse condition.

Make sure that ampere of the fuse is setting value, and it is not blown out.

- 3) Check the connecting condition of harness and harness connector.

4) Confirm settings of body integrated unit are corresponded to vehicle equipment. <Ref. to LAN(diag)-18, REGISTRATION BODY INTEGRATED UNIT (EQUIPMENT SETTING), OPERATION, Subaru Select Monitor.>

5) Confirm setting are corresponded to vehicle equipment by function setting (ECM customizing) of body integrated unit. <Ref. to LAN(diag)-21, FUNCTION SETTING (ECM CUSTOMIZING), OPERATION, Subaru Select Monitor.>

6) Confirm "Factory initial setting" of body integrated unit registrations is "Market".

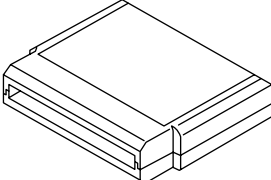

7) Confirm key illumination does not blink with ignition switch turned to ON.

A: ELECTRICAL SPECIFICATION

LAN00012

Description	Connector No.	Terminal No.	Signal (V or Ω)	NOTE
			Ignition switch ON (engine OFF)	
System control power supply	B281	C2	10 — 13 V	Always
Backup power supply	B280	B7	10 — 13 V	Always
Ignition power supply	i84	A1	10 — 13 V	Ignition ON
ACC power supply	i84	A24	10 — 13 V	ACC ON
Ground	i84	A21	Less than 1 Ω	Always
	B281	C9		
	B281	C8		
	B280	B22		
Key warning switch	B281	C7	10 — 13 V	When ignition key inserted
Stop light switch	B281	C23	10 — 13 V	When brake pedal depressed
Illumination volume (Vi1)	i84	A10	4.5 — 5.5 V	Small light ON
Illumination volume (Vi 2)	i84	A2	0.5 — 4.5 V	—
Illumination volume (Vi 3)	i84	A25	Less than 1 Ω	Ground circuit
Illumination output	i84	A5	10 — 13 V	Small light ON
Front fog light input	B281	C17	10 — 13 V	Front fog light ON
Headlight input	B281	C16	10 — 13 V	Headlight ON (Both of Hi, Lo)
Door switch input Driver's seat	i84	A19	Less than 1 V (10 — 13 V at OFF)	Driver's door open (ON)
Door switch input Passenger's seat	i84	A32	Less than 1 V (10 — 13 V at OFF)	Passenger's door open (ON)
Door switch input Rear RH seat	i84	A18	Less than 1 V (10 — 13 V at OFF)	Rear RH door open (ON)
Door switch input Rear LH seat	i84	A31	Less than 1 V (10 — 13 V at OFF)	Rear LH door open (ON)
Door switch Trunk/Rear gate	i84	A17	Less than 1 V (10 — 13 V at OFF)	Trunk/Rear gate open (ON)

Control Module I/O Signal

LAN SYSTEM (DIAGNOSTICS)

Description	Connector No.	Terminal No.	Signal (V or Ω)	NOTE
			Ignition switch ON (engine OFF)	
Illumination control switch	i84	A30	10 — 13 V (at dimmer ON)	Extinct the clock and audio illumination
Manual switch (LOCK)	i84	A15	Less than 1 Ω	Door lock switch ON
Manual switch (UNLOCK)	i84	A29	Less than 1 Ω	Door lock switch ON
Door lock power supply	i84	A34	10 — 13 V	
All door LOCK output	i84	A7	10 — 13 V	Manual, door key switch ON
All door UNLOCK output	i84	A8	10 — 13 V	Manual, door key switch ON
Trunk/Rear gate UNLOCK output	i84	A22	10 — 13 V	When the trunk open signal received with keyless entry (Sedan model)
Key/shift lock power supply	B281	C1	10 — 13 V	
Shift lock output	B280	B6	10 — 13 V	Ignition switch ON, at "P" range, foot brake ON
Wiper deicer switch	i84	A14	Less than 1 Ω	Wiper deicer switch ON
Wiper deicer relay output	B280	B14	Less than 1 Ω	Wiper deicer relay ON
Rear defogger switch	i84	A28	Less than 1 Ω	Rear defogger switch ON
Rear defogger relay output	B281	B16	Less than 1 Ω	Rear defogger relay ON
Shift switch (ON)	B281	C26	Less than 1 Ω	At Manual mode
Shift switch (UP)	B281	C15	Less than 1 Ω	At Manual mode UP
Shift switch (DOWN)	B281	C25	Less than 1 Ω	At Manual mode DOWN
"P" range switch	B281	C13	Less than 1 Ω	
Impact sensor	B281	C5	Less than 1 Ω	Impact sensor ON (Model with immobilizer)
Fuel level sensor	B281	C19	0 — 102.3 Ω	
Ambient sensor	B281	C3	0.5 — 4.5 V	SIG
	B281	C10	Less than 1 Ω	GND
Seat belt switch (driver's seat)	i84	A4	Less than 1 Ω	Driver's seat belt worn
Seat belt switch (passenger's seat)	i84	A13	Less than 1 Ω	Passenger's seat belt worn
Seat belt warning light (driver's seat)	i84	A20	Less than 1 Ω	Driver's seat belt worn
Seat belt warning light (passenger's seat)	B281	C24	Less than 1 Ω	Passenger's seat belt worn
Sedan/Wagon identification switch	B281	C11	10 — 13 V (Sedan model) 0 — 5 V (Wagon model)	
Rear wiper switch (ON)	B281	C6	Less than 1 Ω	Rear wiper switch ON
Rear wiper switch (INT)	B281	C18	Less than 1 Ω	Rear wiper switch ON
Rear washer switch	B281	C27	Less than 1 Ω	Rear washer switch ON
Rear wiper power supply	B280	B21	10 — 13 V	
Rear wiper ON output	B280	B1	10 — 13 V	Rear wiper switch ON
Rear wiper return	B280	B8	Less than 1 Ω	At wiper reversing
		B1 — B8	Less than 1 Ω	
Room light output	B280	B3	Less than 1 Ω	When LOCK, UNLOCK with keyless entry

Control Module I/O Signal

LAN SYSTEM (DIAGNOSTICS)

Description	Connector No.	Terminal No.	Signal (V or Ω)	NOTE
			Ignition switch ON (engine OFF)	
Key ring illumination output	B280	B4	Less than 1 Ω	Ignition key removed, driver door open
Turn hazard output	B280	B12	Less than 1 Ω	When operating keyless entry answer back
Keyless buzzer output	i84	A6	Less than 1 Ω	When operating keyless entry answer back
Security indicator light	i84	A33	Less than 1 Ω	At ignition key removed, immobilizer operating
Kick down switch	B280	B12	Less than 1 Ω	Kick down switch ON
Keyless communication	i84	A9	2 — 10 V	At keyless entry signal received
High-speed CAN circuit (Hi)	B280	B20	Between B20 — B30 Serial communication	At communicating (sending and receiving)

Subaru Select Monitor

LAN SYSTEM (DIAGNOSTICS)

6. Subaru Select Monitor

A: OPERATION

1. READ DIAGNOSTIC TROUBLE CODE (DTC)

NOTE:

- DTC is displayed in the sequence of inputting. (When inputting more than two simultaneously, DTC is displayed in the sequence of priority.)
- When more than two DTCs are displayed, perform the diagnosis of top of them.

1) Prepare the Subaru Select Monitor kit.

2) Connect the diagnosis cable to Subaru Select Monitor.

3) Insert the cartridge to Subaru Select Monitor. <Ref. to LAN(diag)-6, SPECIAL TOOL, PREPARATION TOOL, General Description.>

4) Connect the Subaru Select Monitor to data link connector.

Data link connector is located in the lower portion of the instrument panel (on the driver's side).

CAUTION:

Do not connect scan tools except for Subaru Select Monitor.

5) Turn the ignition switch to ON (engine OFF) and turn the Subaru Select Monitor switch to ON.

(A) Power switch

6) On the «Main Menu» display screen, select the {Each System Check} and press the [YES] key.

7) On the «System Selection Menu» display screen, select the {Integ. Unit mode} and press the [YES] key.

8) On the «Integ. Unit mode failuer diag» display screen, select the {Diagnostic Code(s) Display} and press the [YES] key.

NOTE:

- For details concerning operation procedure, refer to “SUBARU SELECT MONITOR OPERATION MANUAL”.

- For details concerning DTCs, refer to the List of Diagnostic Trouble Code (DTC). <Ref. to LAN(diag)-28, List of Diagnostic Trouble Code (DTC).>

2. READ CURRENT DATA

- 1) On the «Main Menu» display screen, select the {Each System Check} and press the [YES] key.
- 2) On the «System Selection Menu» display screen, select the {Integ. Unit mode} and press the [YES] key.
- 3) On the «Integ. Unit mode failuer diag» display screen, select the {Current Data Display & Save} and press the [YES] key.
- 4) On the «Current Data Display & Save» display screen, select the {12 Data Display} and press the [YES] key.
- 5) Using the scroll key, scroll the display screen up or down until the desired data is shown.
 - A support list contains both of analog and digital data, and they are shown in the following table.

3. DISPLAY OF ANALOG DATA

Items to be displayed	Unit of measure	NOTE
BATT Voltage (Control)	10 — 15 V	—
BATT Voltage (BACK UP)	10 — 15 V	—
IG power supply voltage	10 — 15 V	—

5. CONFIRMATION OF CURRENT SETTING

- 1) On the «Main Menu» display screen, select the {Each System Check} and press the [YES] key.
- 2) On the «System Selection Menu» display screen, select the {Integ. Unit mode} and press the [YES] key.
- 3) On the «Integ. Unit mode failuer diag» display screen, select the {Current Data Display & Save} and press the [YES] key.
- 4) On the «Current Data Display & Save» display screen, select the {12 Data Display} and press the [YES] key.
- 5) Using the scroll key, scroll the display screen up or down until the desired data is shown.
- 6) Display the following items and record the settings.

Required items for new registration (Except for system not equipped)

Item	Item to confirm				Remarks
	1	2	3	4	
Key No. to register					Registered ID type
Off delay	OFF	Long	Normal	Short	Setting for lighting off time
Auto-lock	60, 50, 40, 30, 20		OFF		(Unit sec.)
Rr defogger op. mode	Normal		Continuous		
Wiper deicer op. mode	Normal		Continuous		Optional setting
Security Alarm Setup	ON		OFF		
Impact Sensor Setup	ON		OFF		Optional setting
Alarm monitor delay setting	ON		OFF		
Lockout prevention	ON		OFF		
Impact Sensor	Yes		No		Optional setting
Siren setting	Yes		No		Optional setting
Answer-back buzzer setup	ON		OFF		Not equipped
Hazard answer-back setup	ON		OFF		
Automatic locking setup	ON		OFF		
Ans.-back Buzzer	Yes		No		Not equipped
Auto locking	Yes		No		
Door open warning (prevention of battery run-out)	Yes		No		
A/C ECM setting	Yes		No		Model with auto A/C
P/W ECM setting	Yes		No		Not equipped
Center display failure	Yes		No		Model with center display
Wiper deicer	Yes		No		Optional setting
Rear fog light setting	Yes		No		Optional setting
Factory initial setting	Manufacture		Market		Not change to Manufacture mode

Subaru Select Monitor

LAN SYSTEM (DIAGNOSTICS)

6. REGISTRATION BODY INTEGRATED UNIT (EQUIPMENT SETTING)

CAUTION:

Body integrated unit is core of LAN system, and also can select the function of all vehicle system control. It is possible to control the original functions of vehicle when registrations of body integrated unit and function setting are corresponded to vehicle equipment.

If registrations and function setting are different from vehicle equipment, vehicle system does not operate normally and diagnosis cannot be performed correctly. Pay attention to items below.

- Be sure to correspond registrations and function settings to vehicle equipment.
- Do not change the settings of vehicle improperly.
- Confirm key illumination does not blink or “Factory initial setting” of body integrated unit registrations is “Market”. If “Factory initial setting” is set to “Factory”, key illumination blinks with ignition key turned to ON to give warning of unconfirmed settings.
- Key illumination does not blink with ignition switch turned to ON and go off with door closed.
- Be sure to register immobilizer if body integrated unit is replaced with a new one. (Model with immobilizer)
- Make a registration of immobilizer when the parts replaced related to immobilizer. Refer to “REGISTRATION MANUAL FOR IMMOBILIZER”.

1) Turn the ignition switch to OFF.

2) Connect the Subaru Select Monitor to data link connector.

3) Turn the ignition switch to ON and Subaru Select Monitor to ON.

(A) Power switch

4) On the «Main Menu» display screen, select the {Each System Check} and press the [YES] key.

5) On the «Each System Check» display screen, select the {Integ. Unit mode} and then select the “ECM customizing”.

6) Change the setting with UP/DOWN key and press the [YES] key.

- List of body integrated unit registration item

NOTE:

Setting is different depending on grade of vehicle.

Data		Initial setting	Registration	Remarks
21	A/C ECM setting	OFF	ON	Illumination control does not operate if A/C ECM setting is set to "OFF" in case of model with auto A/C.
			OFF	If A/C ECM setting is set to "ON" in case of model without auto A/C, illumination change to night illumination and it is difficult to be recognized.
22	P/W ECM setting	OFF	ON	Be sure to set P/W ECM setting to "OFF".
			OFF	
23	Center display failure	OFF	ON	Set to "OFF" in case of model with center display.
			OFF	
24	Wiperdeicer	OFF	ON	ON signal does not output with operation of wiper deicer switch if Wiperdeicer is set to "OFF" in model with wiper deicer.
			OFF	
25	Rear fog light setting	OFF	ON	Vehicle is controlled in rear fog light equipped mode.
			OFF	Vehicle is controlled in rear fog light no-equipped mode. (Be sure to set to "OFF" in model without rear fog light.)
26	Factory initial setting (Reset of body integrated unit)	Factory	Factory (Reset)	If Factory initial setting is set to "Factory", registrations of items above is changed to "OFF". Be sure to set to "Market".
			Market (Settlement)	

CAUTION:

- It is possible to control the original functions of vehicle when registrations of body integrated unit and function setting are corresponded to vehicle equipment.
- When body integrated unit is new one or "Factory" mode, key illumination blinks to show equipment settings does not completed.
- Be sure not to change Factory initial setting except installation of new body integrated unit.

NOTE:

"Factory" mode:

- Body integrated unit has not been set yet. It can be recognized by key illumination blinking with ignition switch turned to ON.
- All body integrated units for repair parts are set to "Factory" mode. When replacing a body integrated unit, be sure to perform the registration operation.

"Market" mode:

Each settings have been set. It can be recognized by key illumination coming on in concocting with room light and going off with ignition switch turned to ON.

7) Perform the Factory setting. On the «ECM customizing» display screen of Subaru Select Monitor, select the {Factory initial setting} and press the [YES] key.

8) Change the mode from Factory into Market.

9) Replace the immobilizer cartridge, and register the immobilizer key. (Model with immobilizer)

10) Perform the registration according to the procedures of “IMMOBILIZER REGISTRATION MANUAL”.

11) When key registration is completed, “Do you want to register remote engine start?” is displayed. Perform the registration only if equipped.

12) Perform the function setting (ECM customizing).

<Ref. to LAN(diag)-21, FUNCTION SETTING (ECM CUSTOMIZING), OPERATION, Subaru Select Monitor.>

NOTE:

For details concerning operation procedure, refer to “SUBARU SELECT MONITOR OPERATION MANUAL”.

7. CLEAR MEMORY MODE

1) On the «Main Menu» display screen, select the {2. Each System Check} and press the [YES] key.

2) On the «System Selection Menu» display screen, select the {Integ. Unit mode} and press the [YES] key.

3) Press [YES] key after displayed the information of body integrated unit type.

4) On the «Integ. Unit mode failuer diag» display screen, select the {Clear Memory} and press the [YES] key.

Display	Contents to be monitored
Clear memory?	Clear function of DTC and freeze frame data

5) When the “Done” are shown on the display screen, turn the ignition switch to OFF.

NOTE:

For detailed operation procedure, refer to “SUBARU SELECT MONITOR OPERATION MANUAL”.

8. FREEZE FRAME DATA

NOTE:

- Data stored at the time of trouble occurrence is shown on display.
- Freeze frame data will be memorized maximum to 20.
- If freeze frame data is not stored in memory correctly (caused by low power supply of body integrated unit), DTC will be displayed with “?” on the head of it in the Subaru Select Monitor display. This shows it may be an unreliable reading.

9. FUNCTION SETTING (ECM CUSTOMIZING)

- 1) On the «Main Menu» display screen, select the {Each System Check} and press the [YES] key.
- 2) On the «System Selection Menu» display screen, select the {Integ. Unit mode} and press the [YES] key.
- 3) On the «Integ. Unit mode failuer diag» display screen, select the {ECM customizing} and press the [YES] key.
- 4) Change the setting with UP/DOWN key and press the [YES] key.
 - List of function setting item (ECM customizing)

No.	Data	Initial setting value	Customize setting	Remarks	
1	Off delay time	Normal		Delay time below can be selected by setting.	
				After door closed	After key unlock
			OFF	0 sec.	0 sec.
			Short	3 sec.	10 sec.
			Normal	5 sec.	20 sec.
			Long	8 sec.	30 sec.
2	Auto-lock time	30 sec.	0 — 60 seconds	Workable when Auto locking is set to "ON" and Automatic locking setup is "ON" Time can be changed by 10 seconds: 0 (OFF) — 60 (maximum).	
3	Rr defogger op. mode	15 min.	15 min.	Rear defogger stops in 15 minutes automatically after switch is turned to ON.	
			Continuation	Rear defogger repeats active condition for 15 minutes and inactive condition for 2 minutes until switch is turned to OFF.	
4	Wiper deicer op. mode	15 min.	15 min.	Wiper deicer stops in 15 minutes automatically after switch is turned to ON.	
			Continuation	Wiper deicer repeats active condition for 15 minutes and inactive condition for 2 minutes until switch is turned to OFF.	
5	Security Alarm Setup	OFF	ON	Security alarm (horn or siren) in active condition	
			OFF	Security alarm in inactive condition	
6	Impact Sensor Setup	OFF	ON	Workable when Impact Sensor Setup is set to "ON" Impact sensor in active condition	
			OFF	Impact sensor in inactive condition (Set Impact Sensor Setup of model without impact sensor to "OFF".)	
7	Alarm monitor delay setting	ON		After doors are locked by keyless entry system operated, Alarm monitor starts in following time.	
			ON	Delay time is 30 seconds.	
			OFF	Delay time is 0 second.	
8	Lockout prevention	ON	ON	Lockout prevention in active condition (Lockout prevention does not operate if safety knob is locked by hand.)	
			OFF	Lockout prevention in inactive condition	
9	Impact sensor (OP)	OFF	ON	Vehicle is controlled in impact sensor equipped mode. (Set Impact sensor to "OFF" in model without impact sensor. If Impact sensor is set to "ON", hazard, horn or siren operate after doors are locked by keyless entry system operated (Alarm monitor starting).	
			OFF	Vehicle is controlled in impact sensor no-equipped mode.	
10	Siren setting	OFF	ON	Siren sounds when alarm operates. (Set Siren setting to "OFF" in model without siren. Horn does not sound if Siren setting is set to "ON".)	
			OFF	Horn sounds when alarm operates.	

Subaru Select Monitor

LAN SYSTEM (DIAGNOSTICS)

No.	Data	Initial setting value	Customize setting	Remarks
11	Answer-back buzzer setup	ON	ON	Workable when Answer-back buzzer setup is set to "ON" When lock/unlock is selected by keyless entry system operated, answer-back buzzer sounds.
			OFF	When lock/unlock is selected by keyless entry system operated, answer-back buzzer does not sound.
12	Hazard answer-back setup	ON	ON	Workable when Hazard answer-back setup is set to "ON" When lock/unlock is selected by keyless entry system operated, hazard answer-back operates.
			OFF	When lock/unlock is selected by keyless entry system operated, hazard answer-back does not operate.
13	Automatic locking setup	ON	ON	Workable when Automatic locking setup is set to "ON" When lock/unlock is selected by keyless entry system operated, automatic locking operates.
			OFF	When lock/unlock is selected by keyless entry system operated, automatic locking does not operate.
14	Ans.-back Buzzer	ON	ON	Vehicle is controlled in answer-back buzzer equipped mode.
			OFF	Vehicle is controlled in answer-back buzzer non-equipped mode. (Set Ans.-back Buzzer to "OFF" in model without answer back buzzer.)
15	Auto locking	ON	ON	Vehicle is controlled in auto locking equipped mode.
			OFF	Vehicle is controlled in auto locking non-equipped mode. (Set Auto locking to "OFF" in model without answer-back buzzer.)
16	Initial Keyless Setting	—	—	—
			Execution	Settings of keyless entry system are initialized. (No. 2: 30 sec., No. 11: ON, No. 12: ON, No. 13: ON, No. 14: ON)
17	Initial button setting	—	—	—
			Execution	Settings of each function are initialized. (No. 1: Normal, No. 3: 15 min., No. 4: 15 min., No. 8: ON)
18	Initial Security setting	—	—	—
			Execution	Settings of security system are initialized. (No. 5: OFF, No. 6: OFF, No. 7: ON, No. 10: OFF)
19	Passive Alarm (Not used)	OFF	ON	Workable when passive arming is set to "ON".
			OFF	
20	Door open warning (prevention of battery run-out)	OFF	ON	If detecting door open for 30 minutes, room light, key illumination and door warning light are turned off to prevent battery run-out.
			OFF	Room light, key illumination and door warning light is not turned off.

5) After setting, make sure that vehicle equipment is same as the setting changed in the {Current Data Display & Save}.

CAUTION:

- It is possible to control the original functions of vehicle when settings above are corresponded to vehicle equipment.
- Do not change the settings except for setting above during operation of function setting.
- Be sure not to change "Factory" initial setting except in installation of new body integrated unit.

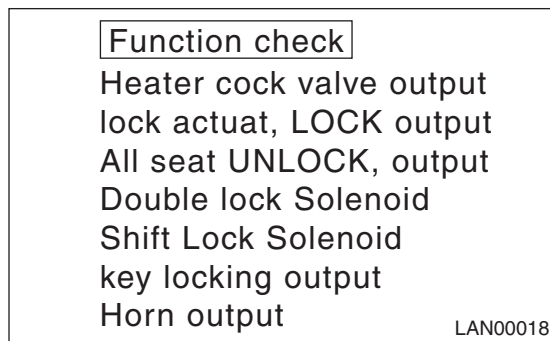

NOTE:

For details concerning operation procedure, refer to "SUBARU SELECT MONITOR OPERATION MANUAL".

10.FUNCTION CHECK

In order to check the body integrated unit function, inspect the body integrated unit and actuator using Subaru Select Monitor without operating switches.

- 1) On the «Main Menu» display screen, select the {Each System Check} and press the [YES] key.
- 2) On the «System Selection Menu» display screen, select the {Integ. Unit mode} and press the [YES] key.
- 3) On the «Integ. Unit mode failuer diag» display screen, select the {System Operation Check Mode} and press the [YES] key.
- 4) Select item to operate on the «System Operation Check Mode» display screen with “UP/Down key”, and press the [YES] key.

- 5) Pressing [YES] starts, [NO] cancels the operation and [YES] returns to the System Operation Check Mode display screen.

NOTE:

If not equipped (based on area or condition), process will not go on.

Read Diagnostic Trouble Code (DTC)

LAN SYSTEM (DIAGNOSTICS)

7. Read Diagnostic Trouble Code (DTC)

A: OPERATION

1. WITHOUT SUBARU SELECT MONITOR

NOTE:

Use the Subaru Select Monitor, because DTCs can not be read out.

2. WITH SUBARU SELECT MONITOR

For details concerning DTC reading procedure, refer to "Subaru Select Monitor". <Ref. to LAN(diag)-14, READ DIAGNOSTIC TROUBLE CODE (DTC), OPERATION, Subaru Select Monitor.>

8. Clear Memory Mode

A: OPERATION

1. WITHOUT SUBARU SELECT MONITOR

NOTE:

Use the Subaru Select Monitor for Clear Memory Mode.

2. WITH SUBARU SELECT MONITOR

For detailed procedures of clearing DTC, refer to "SUBARU SELECT MONITOR". <Ref. to LAN(diag)-20, CLEAR MEMORY MODE, OPERATION, Subaru Select Monitor.>

9. Read Current Data

A: OPERATION

- 1) On the «Main Menu» display screen, select the {Each System Check} and press the [YES] key.
 - 2) On the «System Selection Menu» display screen, select the {Integ. Unit mode} and press the [YES] key.
 - 3) On the «Integ. Unit mode failuer diag» display screen, select the {Current Data Display & Save} and press the [YES] key.
 - 4) On the «Data Display Menu» screen, select the {12 Data Display} and press the [YES] key.
 - 5) Using the scroll key, scroll the display screen up or down until the desired data is shown.
- <Ref. to LAN(diag)-15, DISPLAY OF ANALOG DATA, OPERATION, Subaru Select Monitor.> <Ref. to LAN(diag)-16, DISPLAY OF ON/OFF DATA, OPERATION, Subaru Select Monitor.> <Ref. to LAN(diag)-17, CONFIRMATION OF CURRENT SETTING, OPERATION, Subaru Select Monitor.>

10. Function Setting (Customize)

A: OPERATION

1. WITH SUBARU SELECT MONITOR

For detailed procedures of function setting (ECM customizing), refer to "SUBARU SELECT MONITOR". <Ref. to LAN(diag)-21, FUNCTION SETTING (ECM CUSTOMIZING), OPERATION, Subaru Select Monitor.>

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

LAN SYSTEM (DIAGNOSTICS)

12. Diagnostic Procedure with Diagnostic Trouble Code (DTC)

A: COMMUNICATION FOR INITIALIZING IMPOSSIBLE

NOTE:

- DTC is displayed in the sequence of the amount of counter numbers.
- When more than two DTCs are displayed, perform the diagnosis of top of them.

DIAGNOSIS:

Subaru Select Monitor communication line is open or shorted.

TROUBLE SYMPTOM:

Not communicable with Subaru Select Monitor.

WIRING DIAGRAM:

LAN00148

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

LAN SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No	
1	CHECK IGNITION SWITCH.	Is the ignition switch ON?	Go to step 2	Turn the ignition switch to ON, and select Integ. Unit mode using Subaru Select Monitor.
2	CHECK BATTERY. 1) Turn the ignition switch to OFF. 2) Measure the battery voltage.	Is the voltage more than 11 V?	Go to step 3	Charge or replace the battery.
3	CHECK BATTERY TERMINAL.	Is there poor contact at battery terminal?	Repair or tighten the battery terminal.	Go to step 4
4	CHECK COMMUNICATION OF SUBARU SELECT MONITOR. 1) Turn the ignition switch to ON. 2) Using the Subaru Select Monitor, check whether communication to other systems can be executed normally.	Are system and model year displayed?	Go to step 7	Go to step 5
5	CHECK COMMUNICATION OF SUBARU SELECT MONITOR. 1) Turn the ignition switch to OFF. 2) Disconnect the body integrated unit connector. 3) Turn the ignition switch to ON. 4) Check whether communication to other systems can be executed normally.	Are system and model year displayed?	Go to step 7	Go to step 6
6	CHECK HARNESS CONNECTOR BETWEEN EACH CONTROL UNIT AND SUBARU SELECT MONITOR. 1) Turn the ignition switch to ON. 2) Disconnect the body integrated unit connector. 3) Measure the resistance between data link connector and chassis ground. Connector & terminal (B40) No. 10 — Chassis ground:	Is the resistance more than 1 M Ω ?	Go to step 7	Repair the harness and connector between each control unit and Subaru Select Monitor.
7	CHECK OUTPUT SIGNAL TO BODY INTEGRATED UNIT. 1) Turn the ignition switch to ON. 2) Measure the voltage between body integrated unit and chassis ground. Connector & terminal (B40) No. 10 (+) — Chassis ground (-):	Is the voltage less than 1 V?	Go to step 8	Repair the harness and connector between each control unit and Subaru Select Monitor.
8	CHECK HARNESS CONNECTOR BETWEEN BODY INTEGRATED UNIT AND DATA LINK CONNECTOR. Measure the resistance between body integrated unit and data link connector. Connector & terminal (B40) No. 10 — (B280) No. 19:	Is the resistance less than 1 Ω ?	Go to step 9	Repair the harness and connector between body integrated unit and Subaru Select Monitor.
9	CHECK INSTALLATION OF BODY INTEGRATED UNIT CONNECTOR. Turn the ignition switch to OFF.	Is the body integrated unit connector inserted into body integrated unit until the clamp locks onto it?	Go to step 10	Insert the body integrated unit connector into body integrated unit.

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

LAN SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
10 CHECK POWER SUPPLY CIRCUIT. 1) Turn the ignition switch to ON (engine OFF). 2) Measure the ignition voltage between body integrated unit connector and chassis ground. <i>Connector & terminal</i> <i>(i84) No. 1 (+) — Chassis ground (-):</i>	Is the voltage more than 10 V?	Go to step 11	Repair the open circuit of harness between the body integrated unit and battery.
11 CHECK HARNESS CONNECTOR BETWEEN BODY INTEGRATED UNIT AND CHASSIS GROUND. 1) Turn the ignition switch to OFF. 2) Disconnect the connector from body integrated unit. 3) Measure the harness resistance between the body integrated unit and chassis ground. <i>Connector & terminal</i> <i>(B280) No. 19 — Chassis ground:</i>	Is the resistance more than 1 MΩ?	Go to step 12	Repair the poor contact of harness between the body integrated unit and ground.
12 CHECK POOR CONTACT IN CONNECTORS.	Is there poor contact at control unit ground and Subaru Select Monitor?	Replace the body integrated unit. <Ref. to SL-54, Body Integrated Unit.>	Repair the poor contact connector.

CAUTION:

When replacing body integrated unit on the model with immobilizer system, refer to “REGISTRATION MANUAL FOR IMMOBILIZER”.

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

LAN SYSTEM (DIAGNOSTICS)

B: DIAGNOSTIC TROUBLE CODE (DTC) IS NOT STORED

DTC DETECTING CONDITION:

Defective combination meter

DIAGNOSIS:

- Communication error display in odometer/trip meter is not cleared.
- "No trouble code" is displayed on Subaru Select Monitor.

NOTE:

If DTC is not displayed on Subaru Select Monitor, LAN communication System should be OK.

Step	Check	Yes	No	
1	CHECK COMMUNICATION ERROR DISPLAY WITH COMBINATION METER. Turn the ignition switch to ON.	Is the communication error displayed?	Check DTC.	Go to step 2
2	CHECK COMBINATION METER. Perform the self-diagnosis of combination meter.	Is combination meter OK?	Go to step 3	Replace the combination meter. <Ref. to IDI-15, Combination Meter.>
3	CHECK BODY INTEGRATED UNIT. 1) Display the current data of ECM using Subaru Select Monitor. 2) Check data of "body integrated unit data received".	Is the "Yes" displayed?	Go to step 4	Replace the body integrated unit. <Ref. to SL-54, Body Integrated Unit.>
4	CHECK BODY INTEGRATED UNIT. 1) Display the current data of ECM using Subaru Select Monitor. 2) Check data of "body integrated unit counter update".	Is the "Yes" displayed?	Repair the poor contact connector.	Replace the body integrated unit. <Ref. to SL-54, Body Integrated Unit.>

C: DTC B0100 INTEG. UNIT SYSTEM ERROR

DTC DETECTING CONDITION:

System error in body integrated unit

TROUBLE SYMPTOM:

- Check light comes on in the combination meter, and displays communication error display "Er IU".
- LAN communication immobilizer function may not be executed normally.

Step	Check	Yes	No	
1	CHECK ALL DTCS.	Is DTC concerning ECM displayed?	Go to step 2	Replace the body integrated unit. <Ref. to SL-54, Body Integrated Unit.>
2	CHECK DTC CONCERNING ECM.	Is output DTC on ECM concerning CAN communication error?	Replace the body integrated unit. <Ref. to SL-54, Body Integrated Unit.>	Perform the diagnosis according to DTC concerning ECM.

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

LAN SYSTEM (DIAGNOSTICS)

D: DTC B0101 BATT P/SUPPLY MALFUNCTION CONT.

DTC DETECTING CONDITION:

BATT power supply control circuit is open or shorted.

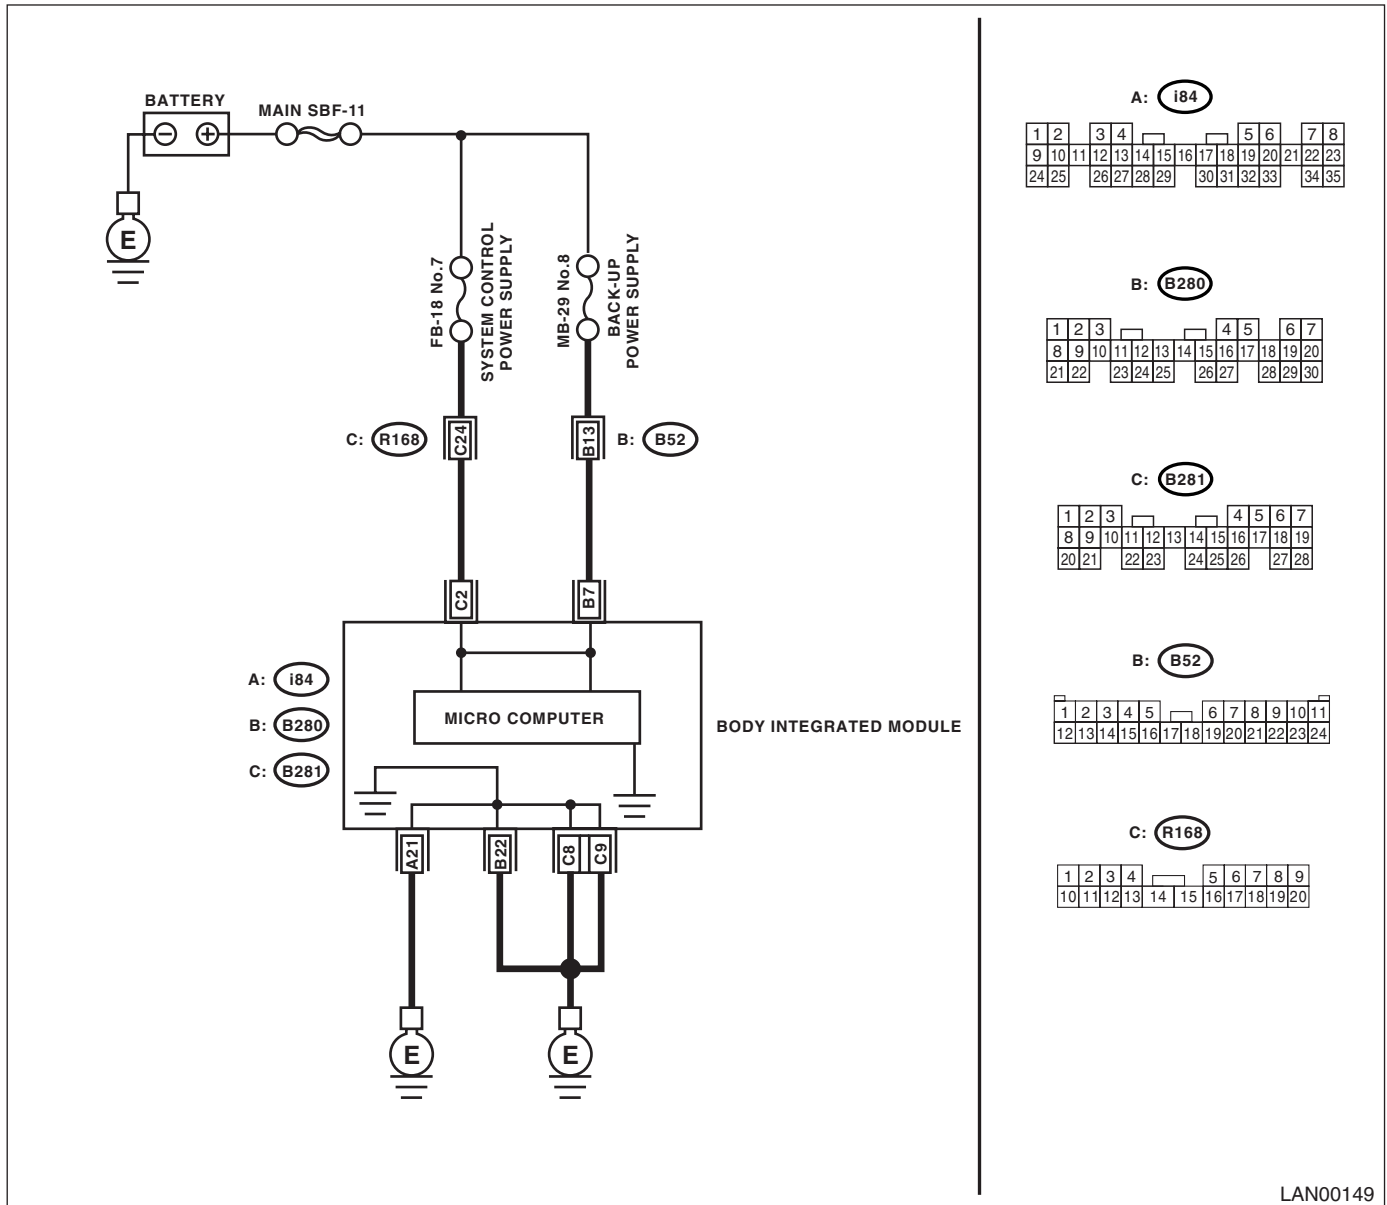

TROUBLE SYMPTOM:

No malfunction occurs with back-up power supply function.

NOTE:

When some B0102 BATT p/supply malfunction backup are output at the same time, all function of body integrated unit may not function.

WIRING DIAGRAM:

LAN00149

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

LAN SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
1 CHECK FUSE (No. 7). 1) Turn the ignition switch to OFF. 2) Remove the fuse (No. 7).	Is the fuse blown out?	Replace the fuse (No. 7). If the replaced fuse has blown out easily, repair the short circuit in harness between fuse (No. 7) and body integrated unit.	Go to step 2
2 CONTINUITY CHECK OF WIRING HARNESS. 1) Disconnect the connector (B281) from body integrated unit. 2) Measure the voltage between body integrated unit connector and chassis ground. Connector & terminal (B281) No. 2 (+) — Chassis ground (-):	Is the voltage more than 10 V?	Go to step 3	Repair the harness for open or shorted circuit between body integrated unit and fuse.
3 CHECK POOR CONTACT IN CONNECTORS.	Is there poor contact in body integrated unit connector?	Repair the poor contact connector.	Go to step 4
4 CHECK BODY INTEGRATED UNIT HARNESS. 1) Connect all the connectors. 2) Perform the clear memory mode. 3) Read DTC.	Is the same DTC displayed?	Replace the body integrated unit. <Ref. to SL-54, Body Integrated Unit.>	Temporary poor contact occurs.

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

LAN SYSTEM (DIAGNOSTICS)

E: DTC B0102 BATT P/SUPPLY MALFUNCTION CONT.

DTC DETECTING CONDITION:

BATT power backup circuit is open or shorted.

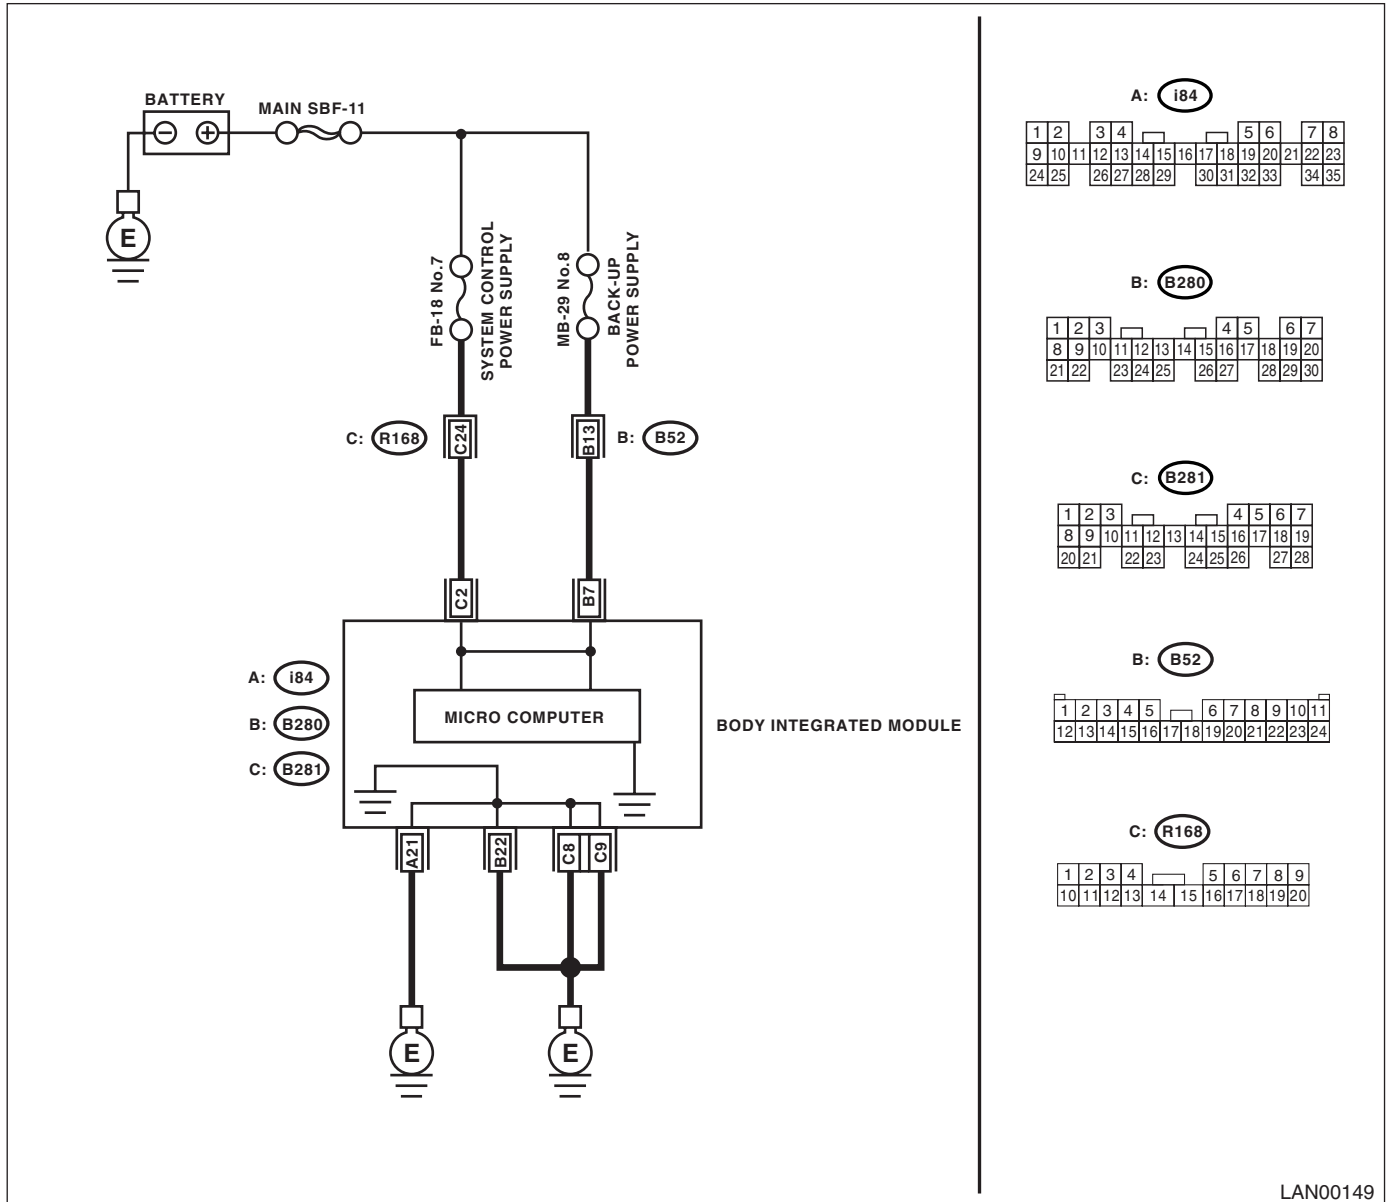

TROUBLE SYMPTOM:

- Engine malfunction indicator light may be illuminates.
- Keyless entry, room light, key illumination does not operate.
- "En IU" may display in combination meter.

NOTE:

When some B0101 BATT p/supply malfunction cont. are output at the same time, all function of body integrated unit may not function.

WIRING DIAGRAM:

LAN00149

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

LAN SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
1 CHECK FUSE (No. 8). 1) Turn the ignition switch to OFF. 2) Remove the fuse (No. 8).	Is the fuse blown out?	Replace the fuse (No. 8). If the replaced fuse has blown out easily, repair the short circuit in harness between fuse (No. 8) and body integrated unit.	Go to step 2
2 CONTINUITY CHECK OF WIRING HARNESS. 1) Disconnect the connector (B280) from body integrated unit. 2) Measure the voltage between body integrated unit connector and chassis ground. Connector & terminal (B280) No. 7 (+) — Chassis ground (-):	Is the voltage more than 10 V?	Go to step 3	Repair the harness for open or shorted circuit between body integrated unit and fuse.
3 CHECK POOR CONTACT IN CONNECTORS.	Is there poor contact in body integrated unit connector?	Repair the poor contact connector.	Go to step 4
4 CHECK BODY INTEGRATED UNIT HARNESS. 1) Connect all the connectors. 2) Perform the clear memory mode. 3) Read DTC.	Is the same DTC displayed?	Replace the body integrated unit. <Ref. to SL-54, Body Integrated Unit.>	Temporary poor contact occurs.

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

LAN SYSTEM (DIAGNOSTICS)

F: DTC B0103 IGNITION POWER FAILURE

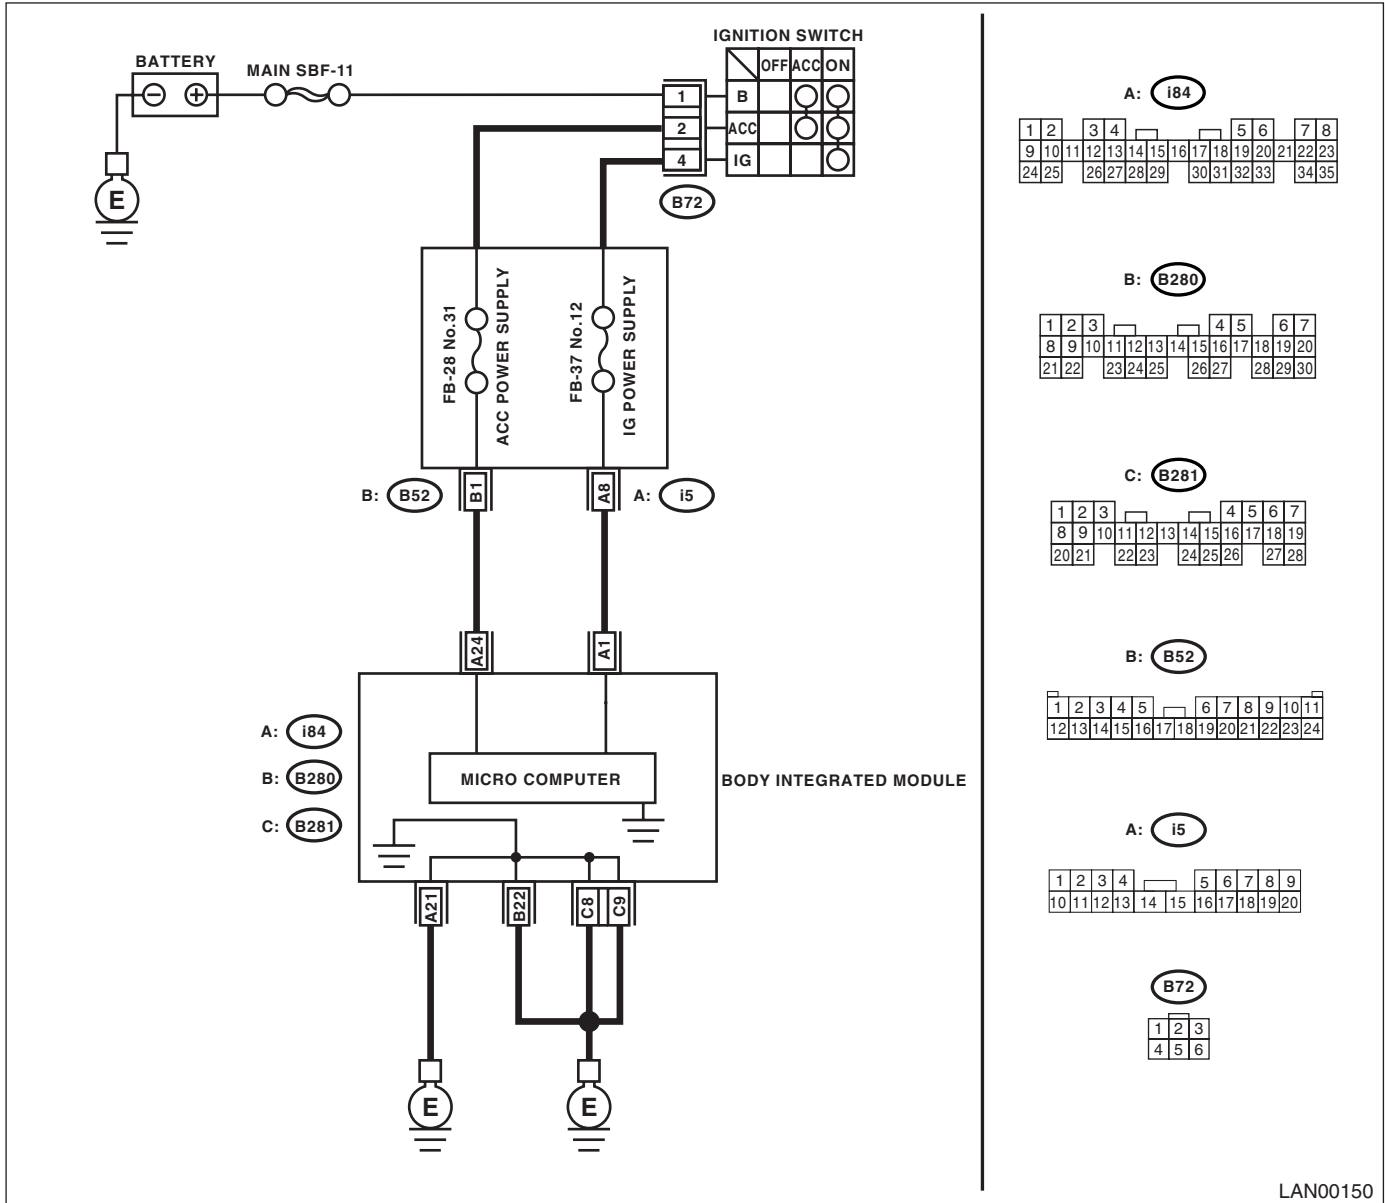

DTC DETECTING CONDITION:

IGN power supply circuit is open or shorted.

TROUBLE SYMPTOM:

Symptom that illuminating engine malfunction indicator light, "Er HC" high speed CAN error display may be occurred.

WIRING DIAGRAM:

Step	Check	Yes	No
1 CHECK FUSE (No. 12). 1) Turn the ignition switch to OFF. 2) Remove the fuse (No. 12).	Is the fuse blown out?	Replace the fuse (No. 12). If the replaced fuse has blown out easily, repair the short circuit in harness between fuse (No. 12) and body integrated unit.	Go to step 2

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

LAN SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
2 CONTINUITY CHECK OF WIRING HARNESS. 1) Disconnect the connector (i84) from body integrated unit. 2) Turn the ignition switch to ON. 3) Measure the voltage between body integrated unit connector and chassis ground. Connector & terminal (i84) No. 1 (+) — Chassis ground (-):	Is the voltage more than 10 V?	Go to step 3	Repair the harness for open or shorted circuit between body integrated unit and fuse.
3 CHECK POOR CONTACT IN CONNECTOR.	Is there poor contact in body integrated unit connector?	Repair the poor contact connector.	Go to step 4
4 CHECK BODY INTEGRATED UNIT HARNESS. 1) Connect all the connectors. 2) Perform the clear memory mode. 3) Read DTC.	Is the same DTC displayed?	Replace the body integrated unit. <Ref. to SL-54, Body Integrated Unit.>	Temporary poor contact occurs.

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

LAN SYSTEM (DIAGNOSTICS)

G: DTC B0104 ACC POWER FAILURE

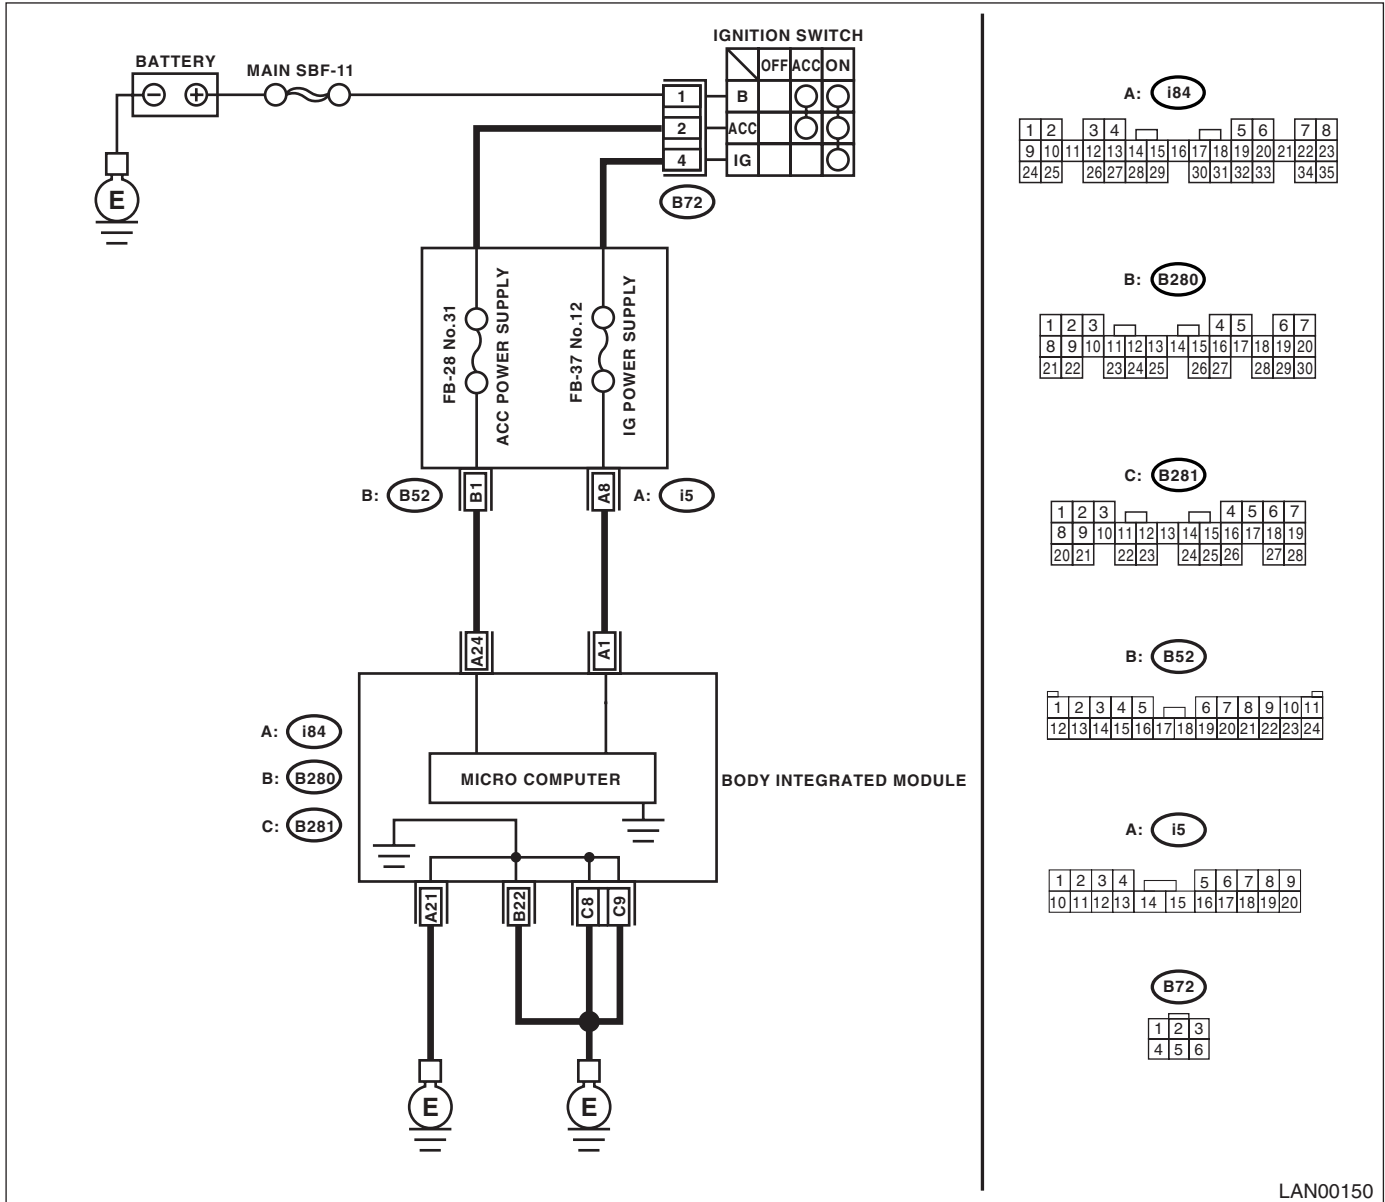

DTC DETECTING CONDITION:

ACC power supply circuit is open or shorted.

TROUBLE SYMPTOM:

Rear wiper may not operate on ACC.

WIRING DIAGRAM:

LAN00150

Step	Check	Yes	No
1 CHECK FUSE (No. 31). 1) Turn the ignition switch to OFF. 2) Remove the fuse (No. 31).	Is the fuse blown out?	Replace the fuse (No. 31). If the replaced fuse has blown out easily, repair the short circuit in harness between fuse (No. 31) and body integrated unit.	Go to step 2

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

LAN SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
2 CONTINUITY CHECK OF WIRING HARNESS. 1) Disconnect the connector (i84) from body integrated unit. 2) Turn the ignition switch to ON. 3) Measure the voltage between body integrated unit connector and chassis ground. Connector & terminal (i84) No. 24 (+) — Chassis ground (-):	Is the voltage more than 10 V?	Go to step 3	Repair the harness for open or shorted circuit between body integrated unit and fuse.
3 CHECK POOR CONTACT IN CONNECTOR.	Is there poor contact in body integrated unit connector?	Repair the poor contact connector.	Go to step 4
4 CHECK BODY INTEGRATED UNIT HARNESS. 1) Connect all the connectors. 2) Perform the clear memory mode. 3) Read DTC.	Is DTC displayed?	Replace the body integrated unit. <Ref. to SL-54, Body Integrated Unit.>	Temporary poor contact occurs.

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

LAN SYSTEM (DIAGNOSTICS)

H: DTC B0105 KEY INTERLOCK CIRCUIT ABNORMAL

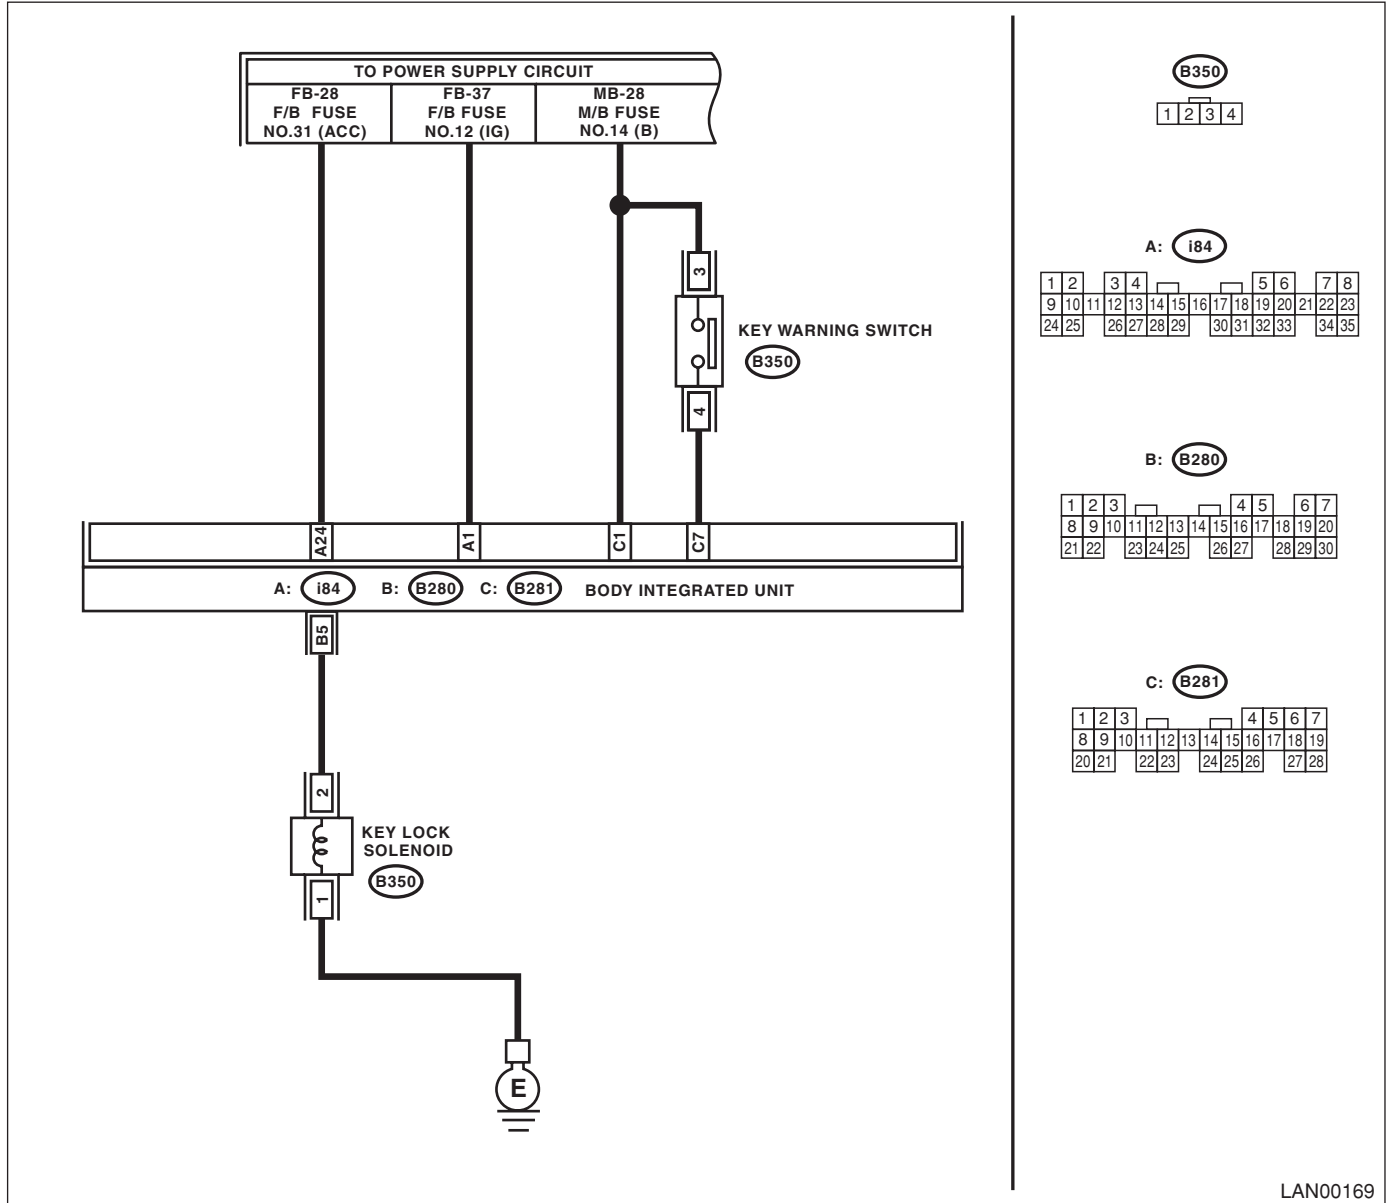

DTC DETECTING CONDITION:

Key interlock circuit is shorted to ground.

TROUBLE SYMPTOM:

- No input of key interlock power supply
- Key interlock does not release or remain locked.

WIRING DIAGRAM:

Step	Check	Yes	No
1 CHECK KEY LOCK SOLENOID. 1) Disconnect the connector of the key lock solenoid. 2) Measure the internal resistance of key lock solenoid. <i>Connector & terminal (B350) No. 1 — No. 2:</i>	Is the resistance between 10 — 30 Ω?	Go to step 2.	Replace the key lock solenoid.

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

LAN SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
2 CHECK GROUND CIRCUIT. 1) Disconnect the connector of the key lock solenoid. 2) Measure the resistance between the key lock solenoid connector and chassis ground. Connector & terminal (B350) No. 1 — Chassis ground:	Is the resistance less than 10 Ω ?	Go to step 3.	Check the key lock solenoid ground circuit for open circuit or for proper installation, and repair the ground circuit if faulty.
3 CHECK HARNESS. 1) Disconnect the body integrated unit connector (B280) and the key lock solenoid connector (B350). 2) Measure the resistance between body integrated unit connector and chassis ground. Connector & terminal (B280) No. 5 — Chassis ground:	Is the resistance 1 M Ω or more?	Replace the body integrated unit. <Ref. to SL-54, Body Integrated Unit.>	Repair the short circuit of harness or replace harness.

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

LAN SYSTEM (DIAGNOSTICS)

I: DTC B0106 SHIFT LOCK CIRCUIT FAILURE

DTC DETECTING CONDITION:

Shift lock circuit is ground shorted.

TROUBLE SYMPTOM:

Key interlock does not unlock or lock.

WIRING DIAGRAM:

LAN00151

Step	Check	Yes	No
1 CHECK HARNESS. 1) Disconnect the body integrated unit connector (B280). 2) Measure the resistance between body integrated unit connector and chassis ground. Connector & terminal (B280) No. 6 — Chassis ground:	Is the resistance 10 — 30 Ω?	Go to step 5	Go to step 2

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

LAN SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
2 CHECK HARNESS. 1) Disconnect the body integrated unit connector (B280). 2) Disconnect the shift lock solenoid connector. 3) Measure the resistance between body integrated unit connector and shift lock solenoid connector. <i>Connector & terminal</i> <i>(B280) No. 6 — (B116) No. 3:</i>	Is the resistance less than 10 Ω ?	Go to step 3	Repair or replace the open or short circuit of harness.
3 CHECK SHIFT LOCK SOLENOID. 1) Disconnect the shift lock solenoid connector. 2) Measure the internal resistance of shift lock solenoid. <i>Connector & terminal</i> <i>(B116) No. 3 — No. 4:</i>	Is the resistance 10 — 30 Ω ?	Go to step 4	Replace the shift lock solenoid.
4 CHECK GROUND CIRCUIT. 1) Disconnect the shift lock solenoid connector. 2) Measure the resistance between shift lock solenoid connector and chassis ground. <i>Connector & terminal</i> <i>(B116) No. 4 — Chassis ground:</i>	Is the resistance less than 10 Ω ?	Temporary poor contact occurs. Check the connection of each terminals, and then repair them if necessary.	Replace the body integrated unit. <Ref. to SL-54, Body Integrated Unit.>
5 CHECK HARNESS. 1) Disconnect the body integrated unit connector (B280) and shift lock solenoid connector (B116). 2) Measure the resistance between body integrated unit connector (B280) and chassis ground. <i>Connector & terminal</i> <i>(B280) No. 6 — Chassis ground:</i>	Is the resistance more than 1 M Ω ?	Replace the body integrated unit. <Ref. to SL-54, Body Integrated Unit.>	Repair or replace the short circuit of harness.

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

LAN SYSTEM (DIAGNOSTICS)

J: DTC B0201 CAN-HS COUNTER ABNORMAL

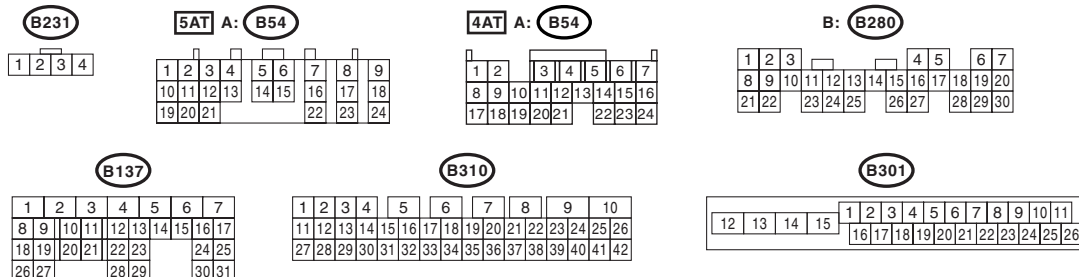

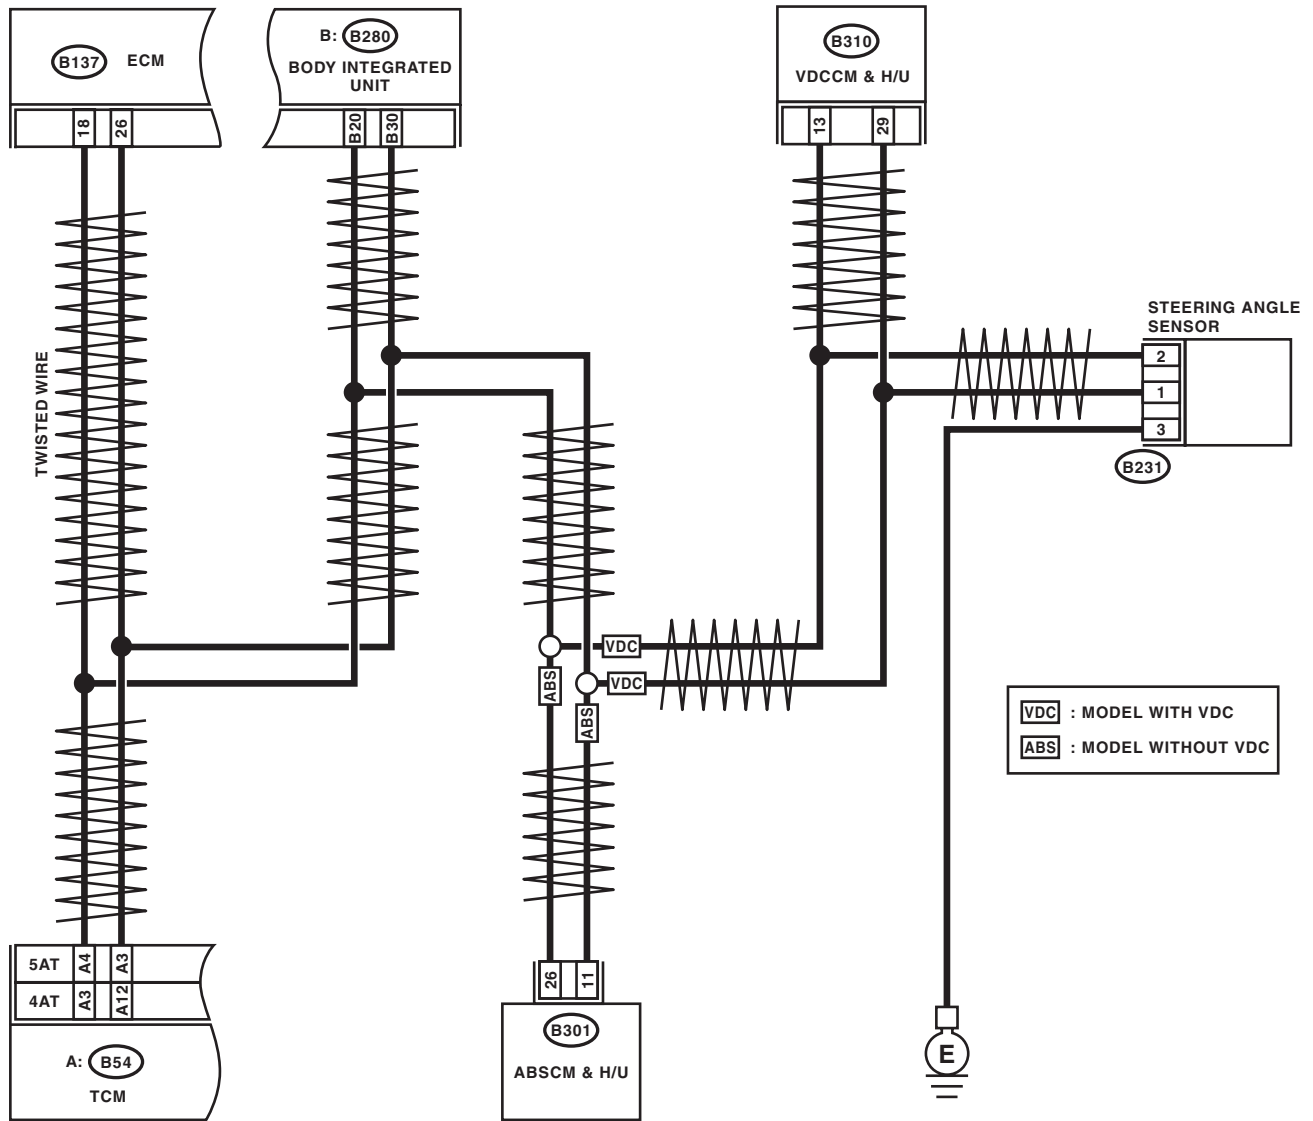

DTC DETECTING CONDITION:

High speed CAN communication of body integrated unit which monitoring the error data and non-received data are faulty.

TROUBLE SYMPTOM:

- "Er HC" is displayed in odo/trip meter.
- Engine malfunction indicator light illuminates.

WIRING DIAGRAM:

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

LAN SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
1 CHECK HARNESS. 1) Disconnect the body integrated unit connector (B280). 2) Connect the tester to No. 20 — No. 30 connector on body side, and measure the resistance. <i>Connector & terminal</i> <i>(B280) No. 20 — No. 30:</i>	Is the resistance 55 — 65 Ω ?	Go to step 5	Go to step 2
2 CHECK HARNESS. Connect the tester to No. 20 — No. 30 connector on body side, and measure the resistance. <i>Connector & terminal</i> <i>(B280) No. 20 — No. 30:</i>	Is the resistance less than 10 Ω ?	Go to step 14	Go to step 3
3 CHECK HARNESS. Connect the tester to No. 20 — No. 30 connector on body side, and measure the resistance. <i>Connector & terminal</i> <i>(B280) No. 20 — No. 30:</i>	Is the resistance 110 — 130 Ω ?	Go to step 15	Go to step 4
4 CHECK HARNESS. Connect the tester to No. 20 — No. 30 connector on body side, and measure the resistance. <i>Connector & terminal</i> <i>(B280) No. 20 — No. 30:</i>	Is the resistance more than 30 M Ω ?	Repair or replace the open circuit in body integrated unit harness.	Go to step 5
5 CHECK HARNESS. Connect the tester to No. 20 — Chassis ground connector on body side, and measure the resistance. <i>Connector & terminal</i> <i>(B280) No. 20 — Chassis ground:</i>	Is the resistance less than 10 Ω ?	Repair or replace the ground short circuit in harness.	Go to step 6
6 CHECK HARNESS. Connect the tester to No. 30 — Chassis ground connector on body side, and measure the resistance. <i>Connector & terminal</i> <i>(B280) No. 30 — Chassis ground:</i>	Is the resistance less than 10 Ω ?	Repair or replace the ground short circuit in harness.	Go to step 7
7 CHECK HARNESS. 1) Connect the tester to No. 20 — Chassis ground connector on body side. 2) Turn the ignition switch to ON, and measure the voltage. <i>Connector & terminal</i> <i>(B280) No. 20 (+) — Chassis ground (-):</i>	Is the voltage more than 6 V?	Go to step 18	Go to step 8
8 CHECK HARNESS. 1) Connect the tester to No. 30 — Chassis ground connector on body side. 2) Turn the ignition switch to ON, and measure the voltage. <i>Connector & terminal</i> <i>(B280) No. 30 (+) — Chassis ground (-):</i>	Is the voltage more than 6 V?	Go to step 19	Go to step 9
9 CHECK CONTROL UNIT. (GO TO STEP 10. EXCEPT FOR MODEL WITH VDC.) 1) Connect the body integrated unit connector. 2) Perform the clear memory. 3) Disconnect the steering angle sensor connector (B231) and read the DTC. <Ref. to LAN(diag)-14, READ DIAGNOSTIC TROUBLE CODE (DTC), OPERATION, Subaru Select Monitor.>	Is the DTC B0201 displayed?	Go to step 10	Replace the steering angle sensor. <Ref. to VDC-16, REPLACEMENT, Steering Angle Sensor.>

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

LAN SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
10 CHECK CONTROL UNIT. (GO TO STEP 11. EXCEPT FOR AT MODEL.) 1) Connect the steering angle sensor connector. 2) Perform the clear memory. 3) Disconnect the TCM connector (B54) and read the DTC.	Is the DTC B0201 displayed?	Go to step 11	Replace the TCM. <Ref. to 5AT-60, REMOVAL, Transmission Control Module (TCM).>
11 CHECK CONTROL UNIT. (VDC/ABS MODEL) 1) Connect the TCM connector. 2) Perform the clear memory. 3) Disconnect the VDC/ABS connector (B301 or B310) and read the DTC.	Is the DTC B0201 displayed?	Go to step 12	Replace the VDC/ABSCM. <Ref. to VDC-7, REMOVAL, VDC Control Module and Hydraulic Control Unit (VDCCM/U).> <Ref. to ABS-6, REMOVAL, ABS Control Module and Hydraulic Control Unit (ABSCM&H/U).>
12 CHECK ECM. 1) Connect all the control unit connector. 2) Check data of "body integrated unit data received" from the current data display of ECM.	Is the "Yes" displayed?	Go to step 13	Replace the body integrated unit.
13 CHECK BODY INTEGRATED UNIT. Check data of "body integrated unit counter update" in the ECM data display using Subaru Select Monitor.	Is the "Yes" displayed?	Replace the ECM.<Ref. to FU(H4SO)-35, REMOVAL, Engine Control Module (ECM).> <Ref. to FU(H4SO U5)-44, REMOVAL, Engine Control Module (ECM).> <Ref. to FU(H6DO)-34, REMOVAL, Engine Control Module (ECM).> <Ref. to FU(H4DOTC)-39, REMOVAL, Engine Control Module (ECM).>	Replace the body integrated unit. <Ref. to SL-54, REMOVAL, Body Integrated Unit.>
14 CHECK HARNESS. 1) Disconnect the body integrated unit connector (B280). 2) Connect the tester to No. 20 — No. 30 connector on body side, and measure the resistance. 3) Disconnect the connector of each control unit. Connector & terminal (B280) No. 20 — (B280) No. 30:	Is there any control unit in which the resistance was changed from less than 10 Ω?	Replace the relevant control unit.	Repair or replace the short circuit in harness.

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

LAN SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
15 CHECK HARNESS. 1) Disconnect the VDC/ABSCM connector. 2) Connect the tester to No. 20 — No. 30 connector on body side, and measure the resistance. Connector & terminal (B280) No. 20 — (B280) No. 30:	Does the resistance change to more than 30 MΩ?	Replace the VDC/ABSCM. <Ref. to VDC-7, REMOVAL, VDC Control Module and Hydraulic Control Unit (VDCCM/U).> <Ref. to ABS-6, REMOVAL, ABS Control Module and Hydraulic Control Unit (ABSCM&H/U).>	Go to step 16
16 CHECK HARNESS. 1) Connect the VDC/ABSCM, and disconnect the ECM connector (B136 or B137). 2) Connect the tester to No. 20 — No. 30 connector on body side, and measure the resistance. Connector & terminal (B280) No. 20 — (B280) No. 30:	Does the resistance change to more than 30 MΩ?	Replace the ECM.	Go to step 17
17 CHECK HARNESS. 1) Disconnect all the control unit (Body integrated unit, ECM, TCM, VDC/ABS, steering angle sensor). 2) Connect the tester to No. 20 — No. 30 connector on body side, and measure the resistance. Connector & terminal (B280) No. 20 — (B280) No. 30:	Is the resistance more than 30 MΩ?	A temporary poor contact.	Repair or replace the short circuit in harness.
18 CHECK HARNESS. 1) Connect the tester to body integrated unit connector on body side. 2) Turn the ignition switch to ON, and disconnect the unit connectors in the order. (TCM: B54, VDC/ABS: B301, B310, ECM: B137, B135, Steering angle sensor: B231) Connector & terminal (B280) No. 20 — Chassis ground:	Is there any unit in which the voltage was lowered from more than 6 V upon disconnection?	Replace the relevant unit.	Repair or replace the short circuit in harness.
19 CHECK HARNESS. 1) Connect the tester to body integrated unit connector on body side. 2) Turn the ignition switch to ON, and disconnect the unit connectors in the order. (TCM: B54, VDC/ABS: B301, B310, ECM: B137, B135, Steering angle sensor: B231) Connector & terminal (B280) No. 30 (+) — Chassis ground (-):	Is there any unit in which the voltage was lowered from more than 6 V upon disconnection?	Replace the relevant unit.	Repair or replace the short circuit in harness.

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

LAN SYSTEM (DIAGNOSTICS)

K: DTC B0202 CAN-HS BUS OFF

DTC DETECTING CONDITION:

- Locate the unit or CAN line which trouble occurs, and repair and replace it.
- Not received data and error data may be detected at the same time.

TROUBLE SYMPTOM:

“Er HC” is displayed in odo/trip meter.

WIRING DIAGRAM:

LAN00144

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

LAN SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
1 CHECK TCM. 1) Disconnect the TCM connector (B54). 2) Perform the clear memory of body integrated unit. <Ref. to LAN(diag)-20, CLEAR MEMORY MODE, OPERATION, Subaru Select Monitor.> 3) Read DTC of body integrated unit.	Is DTC (B0202) displayed?	Go to step 2	Replace the TCM. <Ref. to 4AT-124, Transmission Control Device.> <Ref. to 5AT-60, Transmission Control Module (TCM).>
2 CHECK STEERING ANGLE SENSOR. 1) Disconnect the steering angle sensor connector (B231). 2) Perform the clear memory mode of body integrated unit. <Ref. to LAN(diag)-20, CLEAR MEMORY MODE, OPERATION, Subaru Select Monitor.> 3) Read DTC of body integrated unit.	Is DTC (B0202) displayed?	Go to step 3	Replace the steering angle sensor. <Ref. to VDC-16, REPLACEMENT, Steering Angle Sensor.>
3 CHECK BODY INTEGRATED UNIT. 1) Disconnect the body integrated unit connector (B280). 2) Read the data between VDC/ABSCM and ECM. Check item: <ul style="list-style-type: none"> • Engine speed • Average front wheel speed (value on constant driving) 	Engine speed, front wheel speed is correctly communicated. (Appears same value)	Replace the body integrated unit. <Ref. to SL-54, Body Integrated Unit.>	Go to step 4
4 CHECK HARNESS. 1) Disconnect the body integrated unit connector (B280). 2) Measure the resistance between harness connector terminals. <i>Connector & terminal</i> <i>(B280) No. 20 — No. 30:</i>	Is the resistance 55 — 65 Ω?	Go to step 10	Go to step 5
5 CHECK HARNESS. 1) Disconnect the body integrated unit connector (B280). 2) Measure the resistance between harness connector terminals. <i>Connector & terminal</i> <i>(B280) No. 20 — No. 30:</i>	Is the resistance 115 — 125 Ω?	Go to step 7	Go to step 6
6 CHECK HARNESS. 1) Disconnect the harness connector of body integrated unit. 2) Measure the resistance between harness connector terminals. <i>Connector & terminal</i> <i>(B280) No. 20 — No. 30:</i>	Is the resistance more than 30 MΩ?	Open harness on related line of body integrated unit. Repair or replace the open circuit of harness.	Go to step 7
7 CHECK HARNESS. 1) Disconnect the VDC/ABSCM connector (ABS:B301, VDC:310). 2) Measure the resistance between harness connector terminals. <i>Connector & terminal</i> <i>ABS</i> <i>(B301) No. 11 — No. 26:</i> <i>VDC</i> <i>(B310) No. 13 — No. 29:</i>	Is the resistance 115 — 125 Ω?	Go to step 8	Go to step 9

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

LAN SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
8 CHECK VDC/ABSCM. 1) Disconnect the VDC/ABSCM connector (ABS:B301, VDC:310). 2) Measure the resistance between VDC/ABSCM terminals. Connector & terminal ABS <i>(B301) No. 11 — No. 26:</i> VDC <i>(B310) No. 13 — No. 29:</i>	Is the resistance 115 — 125 Ω?	Go to step 9	Open harness in end resistance of VDC/ABSCM. Replace the VDC/ABSCM. <Ref. to ABS-6, ABS Control Module and Hydraulic Control Unit (ABSCM&H/U).> <Ref. to VDC-7, VDC Control Module and Hydraulic Control Unit (VDCCM/U).>
9 CHECK ECM. 1) Disconnect the ECM connector (B137). 2) Measure the resistance between ECM connector terminals. Connector & terminal <i>(B137) No. 18 — No. 26:</i>	Is the resistance 115 — 125 Ω?	Repair or replace the open circuit of harness connector.	Open harness in end resistance of ECM. Replace the ECM. <Ref. to FU(H4SO)-35, Engine Control Module (ECM).> <Ref. to FU(H4SO U5)-44, Engine Control Module (ECM).> <Ref. to FU(H4DOTC)-39, Engine Control Module (ECM).> <Ref. to FU(H6DO)-34, Engine Control Module (ECM).>
10 CHECK HARNESS. 1) Disconnect the body integrated unit connector (B280). 2) Measure the resistance between body integrated unit connector and chassis ground. Connector & terminal <i>(B280) No. 20 — Chassis ground:</i> <i>(B280) No. 30 — Chassis ground:</i>	Is the resistance less than 10 Ω? (Ground)	Repair or replace the ground short circuit of the harness.	Go to step 11
11 CHECK HARNESS. 1) Disconnect the body integrated unit connector (B280). 2) Measure the voltage between body integrated unit connector and chassis ground. Connector & terminal <i>(B280) No. 20 (+) — Chassis ground (-):</i> <i>(B280) No. 30 (+) — Chassis ground (-):</i>	Is the voltage more than 6 V? (Power)	Repair or replace the short circuit of harness.	Go to step 12
12 CHECK DTC. Read the DTC of ECM using Subaru Select Monitor. <Ref. to EN(H4SO)(diag)-27, READ DIAGNOSTIC TROUBLE CODE (DTC) FOR ENGINE (NORMAL MODE), OPERATION, Subaru Select Monitor.> <Ref. to EN(H4DOTC)(diag)-28, READ DIAGNOSTIC TROUBLE CODE (DTC) FOR ENGINE (NORMAL MODE), OPERATION, Subaru Select Monitor.>	Is DTC other than “CAN communication” displayed?	Perform the diagnosis according to DTC.	Go to step 13

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

LAN SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
13 CHECK DTC. Read the DTC of VDC/ABSCM using Subaru Select Monitor. <Ref. to ABS(diag)-15, READ DIAGNOSTIC TROUBLE CODE (DTC), OPERATION, Subaru Select Monitor.> <Ref. to VDC(diag)-16, READ DIAGNOSTIC TROUBLE CODE (DTC), OPERATION, Subaru Select Monitor.>	Is DTC other than "CAN communication" displayed?	Perform the diagnosis according to DTC.	Go to step 14
14 CHECK DTC. Read the DTC of TCM using Subaru Select Monitor. <Ref. to 4AT(D)(diag)-14, READ DIAGNOSTIC TROUBLE CODE (DTC), OPERATION, Subaru Select Monitor.> <Ref. to 5AT(diag)-15, READ DIAGNOSTIC TROUBLE CODE (DTC), OPERATION, Subaru Select Monitor.>	Is DTC other than "CAN communication" displayed?	Perform the diagnosis according to DTC.	Replace the body integrated unit. <Ref. to SL-54, Body Integrated Unit.>

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

LAN SYSTEM (DIAGNOSTICS)

L: DTC B0211 CAN-HS ECM DATA ABNORMAL

DTC DETECTING CONDITION:

Defective data from ECM.

TROUBLE SYMPTOM:

“Er HC” or “Er EG” is displayed in odo/trip meter.

WIRING DIAGRAM:

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

LAN SYSTEM (DIAGNOSTICS)

	Step	Check	Yes	No
1	CHECK ECM. Read the DTC of ECM using Subaru Select Monitor.	Is DTC other than "CAN communication" displayed?	Perform the diagnosis according to DTC.	Replace the ECM. <Ref. to FU(H4SO)-35, Engine Control Module (ECM).> <Ref. to FU(H4SO U5)-44, Engine Control Module (ECM).> <Ref. to FU(H4DOTC)-39, Engine Control Module (ECM).> <Ref. to FU(H6DO)-34, Engine Control Module (ECM).>

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

LAN SYSTEM (DIAGNOSTICS)

M: DTC B0212 CAN-HS TCM DATA ABNORMAL

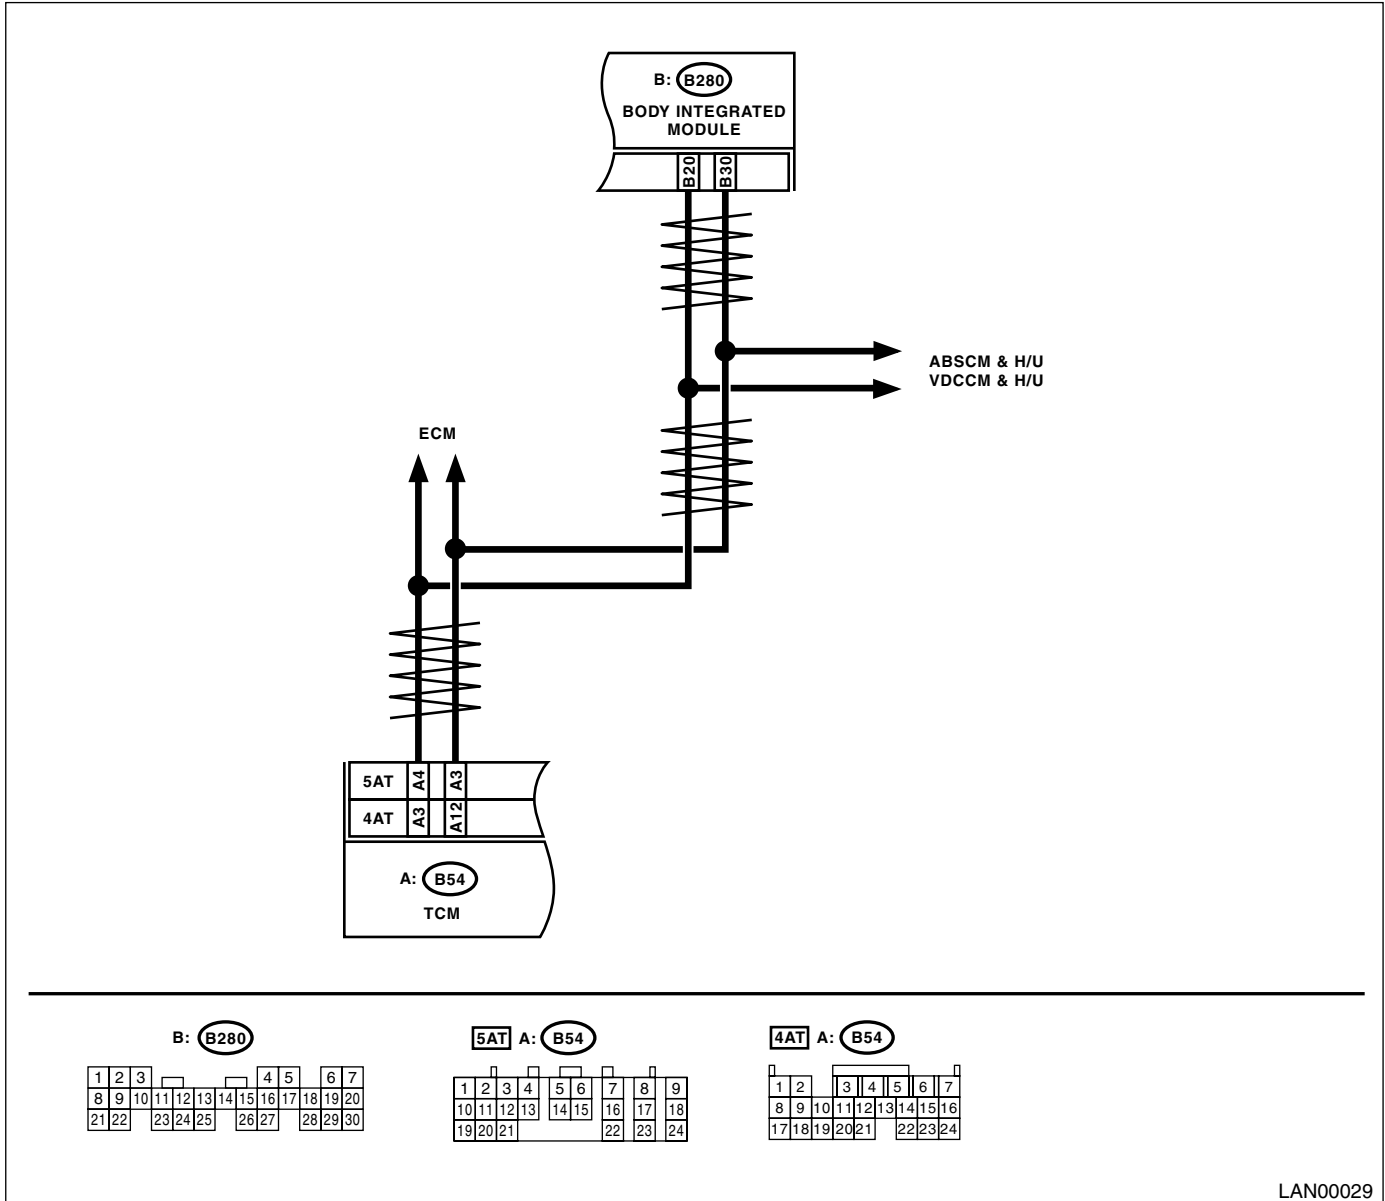

DTC DETECTING CONDITION:

TCM error, or harness between the main harness splice and TCM is open or short, the connector is not connected securely and the terminal has poor caulking.

TROUBLE SYMPTOM:

- SPORT indicator light blinks.
- "Er HC" or "Er tC" is displayed in odo/trip meter.

WIRING DIAGRAM:

LAN00029

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

LAN SYSTEM (DIAGNOSTICS)

	Step	Check	Yes	No
1	CHECK TCM. Read the DTC of TCM using Subaru Select Monitor. <Ref. to 4AT(D)(diag)-14, READ DIAGNOSTIC TROUBLE CODE (DTC), OPERATION, Subaru Select Monitor.> <Ref. to 5AT(diag)-15, READ DIAGNOSTIC TROUBLE CODE (DTC), OPERATION, Subaru Select Monitor.>	Is DTC other than "CAN communication" displayed?	Perform the diagnosis according to DTC.	Replace the TCM. <Ref. to 4AT-64, Transmission Control Module (TCM).> <Ref. to 5AT-60, Transmission Control Module (TCM).>

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

LAN SYSTEM (DIAGNOSTICS)

N: DTC B0213 CAN-HS VDC/ABS DATA ABNORMAL

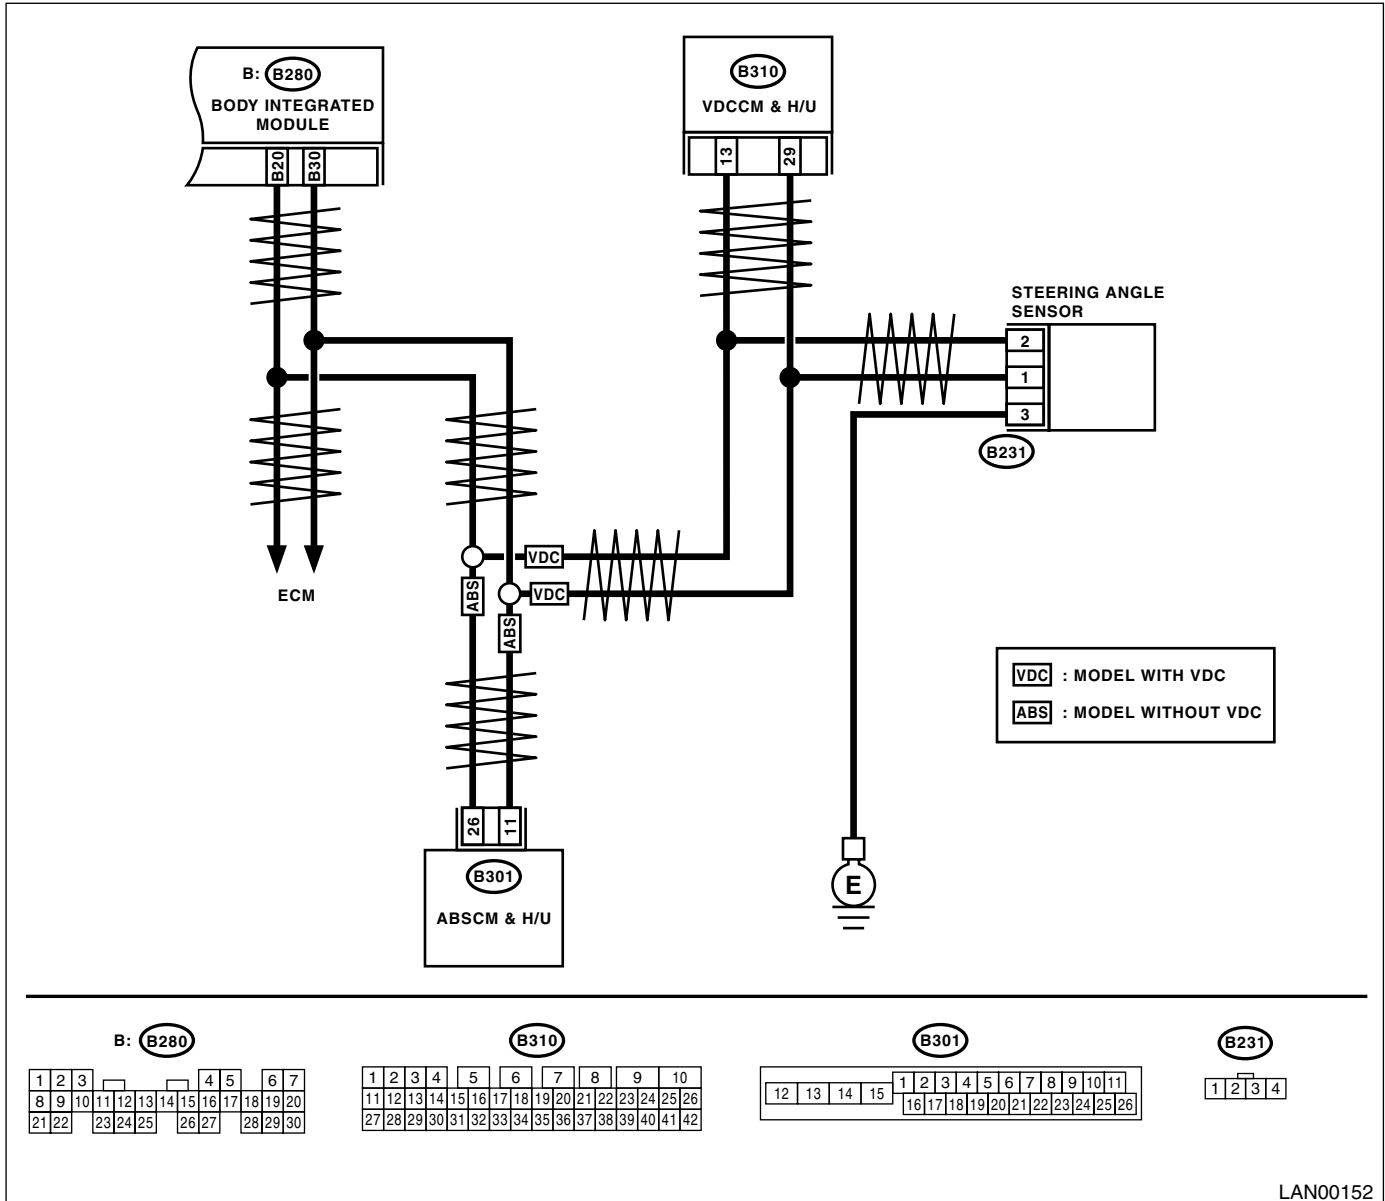

DTC DETECTING CONDITION:

VDC/ABSCM body error, or harness between the main harness splice and TCM is open or short, the connector is not connected securely and the terminal has poor caulking.

TROUBLE SYMPTOM:

- ABS warning light and VDC warning light come on.
- “Er HC” or “Er Ab” is displayed in odo/trip meter.

WIRING DIAGRAM:

LAN00152

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

LAN SYSTEM (DIAGNOSTICS)

	Step	Check	Yes	No
1	CHECK VDC/ABSCM. Read the DTC of VDC/ABSCM using Subaru Select Monitor.	Is DTC other than "CAN communication" displayed?	Perform the diagnosis according to DTC.	Replace the VDC/ABSCM. <Ref. to ABS-6, ABS Control Module and Hydraulic Control Unit (ABSCM&H/U).> <Ref. to VDC-7, VDC Control Module and Hydraulic Control Unit (VDCCM/U).>

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

LAN SYSTEM (DIAGNOSTICS)

O: DTC B0221 CAN-HS ECM NO-RECEIVE DATA

DTC DETECTING CONDITION:

Defective ECM. (If error is in the main harness, Diagnostic Trouble Code (DTC) P0600 High-speed CAN circuit is input simultaneously.)

TROUBLE SYMPTOM:

- Engine malfunction indicator light illuminates.
- "Er HC" is displayed in odo/trip meter.

WIRING DIAGRAM:

LAN00145

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

LAN SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
1 CHECK HARNESS. 1) Disconnect the body integrated unit connector (B280). 2) Measure the resistance between harness connectors. <i>Connector & terminal</i> <i>(B280) No. 20 — No. 30:</i>	Is the resistance 55 — 65 Ω? (Standard 60 Ω)	Read the DTC of ECM. Perform the diagnosis according to DTC. <Ref. to to EN(H4SO)(diag)-27, READ DIAGNOSTIC TROUBLE CODE (DTC) FOR ENGINE (NORMAL MODE), OPERATION, Subaru Select Monitor.> <Ref. to EN(H4SO U5)(diag)-28, READ DIAGNOSTIC TROUBLE CODE (DTC) FOR ENGINE (NORMAL MODE), OPERATION, Subaru Select Monitor.> <Ref. to EN(H4DOTC)(diag)-28, READ DIAGNOSTIC TROUBLE CODE (DTC) FOR ENGINE (NORMAL MODE), OPERATION, Subaru Select Monitor.> <Ref. to EN(H6DO)(diag)-26, READ DIAGNOSTIC TROUBLE CODE (DTC) FOR ENGINE (NORMAL MODE), OPERATION, Subaru Select Monitor.>	Go to step 2
2 CHECK HARNESS. 1) Disconnect the body integrated unit connector (B280). 2) Measure the resistance between harness connectors. <i>Connector & terminal</i> <i>(B280) No. 20 — No. 30:</i>	Is the resistance 115 — 125 Ω? (End resistance or main line is open)	Go to step 3	Related line of body integrated unit is open when ∞ Ω. Repair or replace the open circuit of harness.
3 CHECK HARNESS. 1) Disconnect the ECM connector (B137). 2) Measure the resistance between harness connector terminals. <i>Connector & terminal</i> <i>(B137) No. 18 — No. 26:</i>	Is the resistance 115 — 125 Ω? (End resistance standard 120 Ω)	Go to step 4	Go to step 5

	Step	Check	Yes	No
1	<p>CHECK HARNESS.</p> <p>1) Disconnect the TCM connector (B54)</p> <p>2) Measure the resistance between harness connector terminals.</p> <p>Connector & terminal</p> <p>4AT MODEL (B54) No. 3 — No. 12:</p> <p>5AT MODEL (B54) No. 3 — No. 4:</p>	Is the resistance $\infty \Omega$?	Open harness in related lines of TCM. Repair or replace the open circuit of harness.	Go to step 2

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

LAN SYSTEM (DIAGNOSTICS)

	Step	Check	Yes	No
2	CHECK TCM. Read the DTC of TCM using Subaru Select Monitor. <Ref. to 4AT(D)(diag)-14, READ DIAGNOSTIC TROUBLE CODE (DTC), OPERATION, Subaru Select Monitor.> <Ref. to 5AT(diag)-15, READ DIAGNOSTIC TROUBLE CODE (DTC), OPERATION, Subaru Select Monitor.>	Is DTC other than "CAN communication" displayed?	Perform the diagnosis according to DTC.	Replace the TCM. <Ref. to 4AT-64, Transmission Control Module (TCM).> <Ref. to 5AT-60, Transmission Control Module (TCM).>

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

LAN SYSTEM (DIAGNOSTICS)

Q: DTC B0223 CAN-HS VDC/ABS NO-RECEIVE DATA

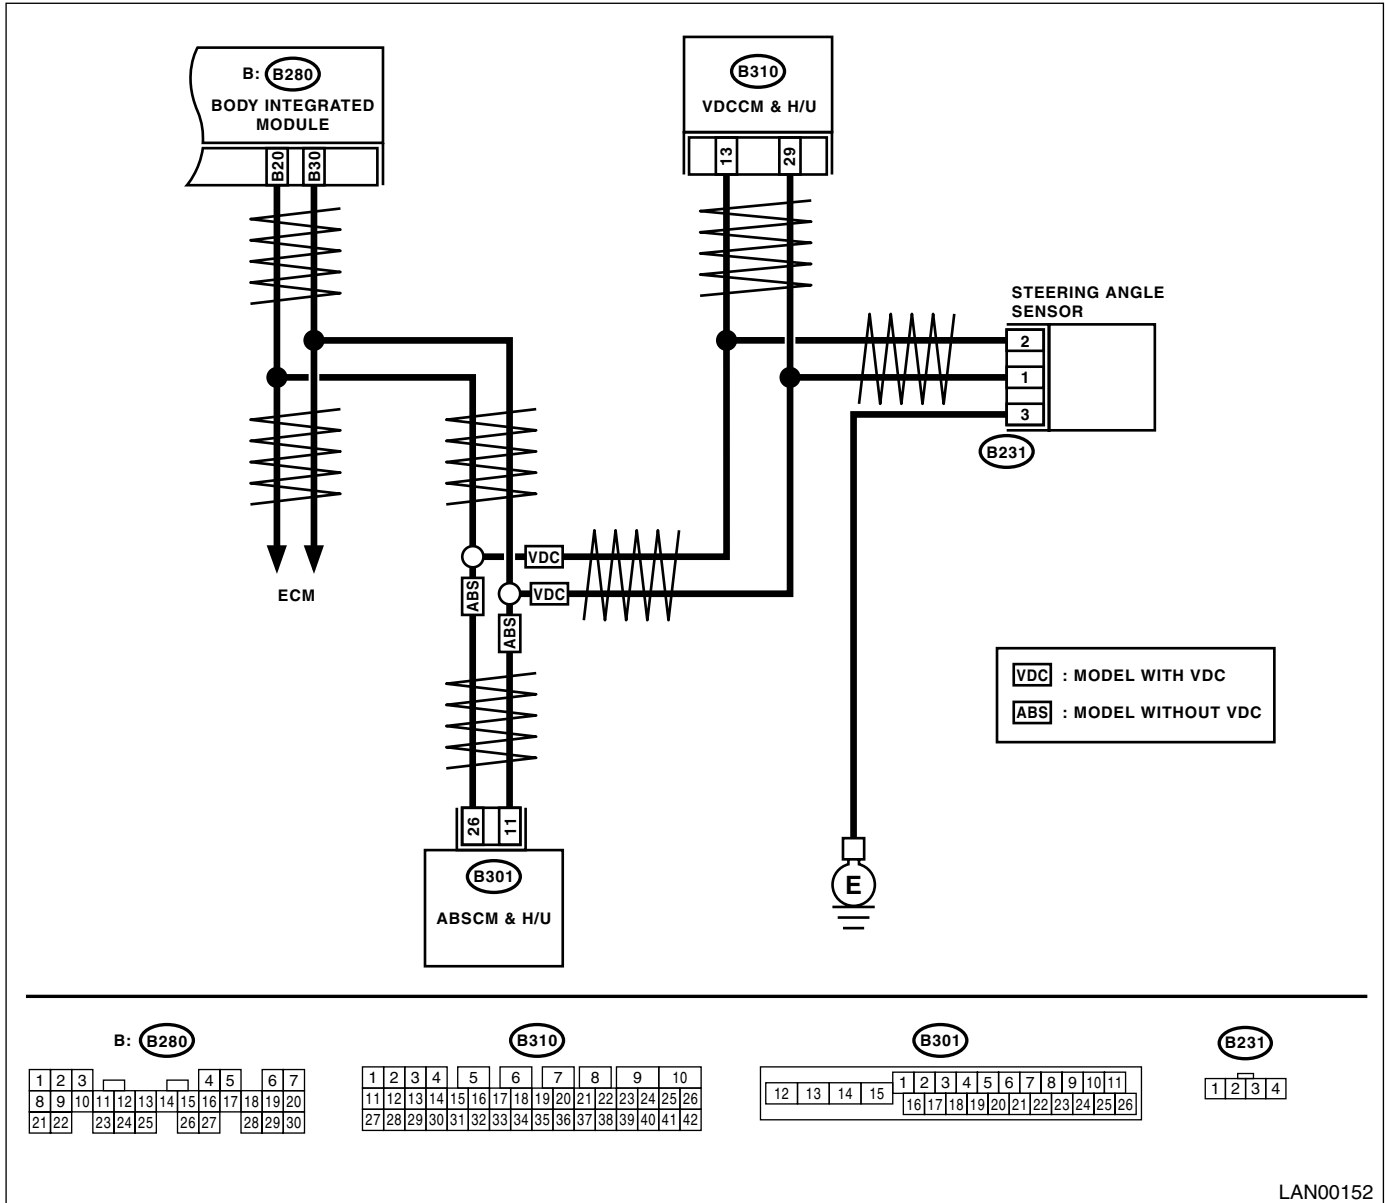

DTC DETECTING CONDITION:

Defective VDC/ABSCM. (If error is in the main harness, DTC P0600 High-speed CAN circuit is input at the same time.)

TROUBLE SYMPTOM:

- ABS warning light and VDC warning light come on.
- “Er HC” is displayed in odo/trip meter.

WIRING DIAGRAM:

Step	Check	Yes	No
1 CHECK HARNESS. 1) Disconnect the harness connector of body integrated unit. 2) Measure the resistance between harness connector terminals. Connector & terminal (B280) No. 20 — No. 30:	Is the resistance 55 — 65 Ω?	Read the DTC of VDC/ABSCM, and perform the diagnosis according to DTC.	Go to step 2

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

LAN SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
2 CHECK HARNESS. 1) Disconnect the harness connector of body integrated unit. 2) Measure the resistance between harness connector terminals. Connector & terminal (B280) No. 20 — No. 30:	Is the resistance 115 — 125 Ω ?	Go to step 5	Go to step 3
3 CHECK HARNESS. 1) Disconnect the harness connector of body integrated unit. 2) Measure the resistance between the harness connector terminal and chassis ground. Connector & terminal (B280) No. 20 — Chassis ground: (B280) No. 30 — Chassis ground:	Is the resistance $\infty \Omega$?	Open harness on related line of body integrated unit. Repair or replace the open circuit of harness.	Go to step 4
4 CHECK HARNESS. 1) Disconnect the harness connector of body integrated unit. 2) Measure the voltage between the harness connector terminal and chassis ground. (Ignition switch ON) Connector & terminal (B280) No. 20 (+) — Chassis ground (-): (B280) No. 30 (+) — Chassis ground (-):	Is the voltage more than 6 V?	Repair or replace the short circuit of harness.	Go to step 5
5 CHECK END RESISTANCE. 1) Disconnect the VDC/ABSCM harness connector. 2) Measure the resistance between VDC/ABSCM connector terminals. Connector & terminal ABS (B301) No. 11 — No. 26: VDC (B310) No. 13 — No. 29:	Is the resistance between 115 — 125 Ω ?	Go to step 6	End resistance is opened. Replace the VDC/ABSCM. <Ref. to ABS-6, ABS Control Module and Hydraulic Control Unit (ABSCM&H/U).> <Ref. to VDC-7, VDC Control Module and Hydraulic Control Unit (VDCCM/U).>
6 CHECK HARNESS. 1) Disconnect the body integrated unit connector (B280) and VDC/ABSCM connector (ABS:B301, VDC:310). 2) Measure the resistance between harness connector terminals. Connector & terminal ABS (B301) No. 11 — (B280) No. 30: (B301) No. 26 — (B280) No. 20: VDC (B310) No. 13 — (B280) No. 20: (B310) No. 29 — (B280) No. 30:	Is the resistance less than 10 Ω ?	Go to step 7	Main wiring harness opened. Repair or replace the open circuit of harness.
7 CHECK VDC/ABSCM. 1) Connect all the connectors. 2) Read the DTC of VDC/ABSCM using Subaru Select Monitor.	Is DTC other than “CAN communication” displayed?	Perform the diagnosis according to DTC concerning VDC/ABSCM.	Temporary poor contact occurs. Check the connecting condition of connector and terminals.

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

LAN SYSTEM (DIAGNOSTICS)

R: DTC B0300 CAN-LS MALFUNCTION

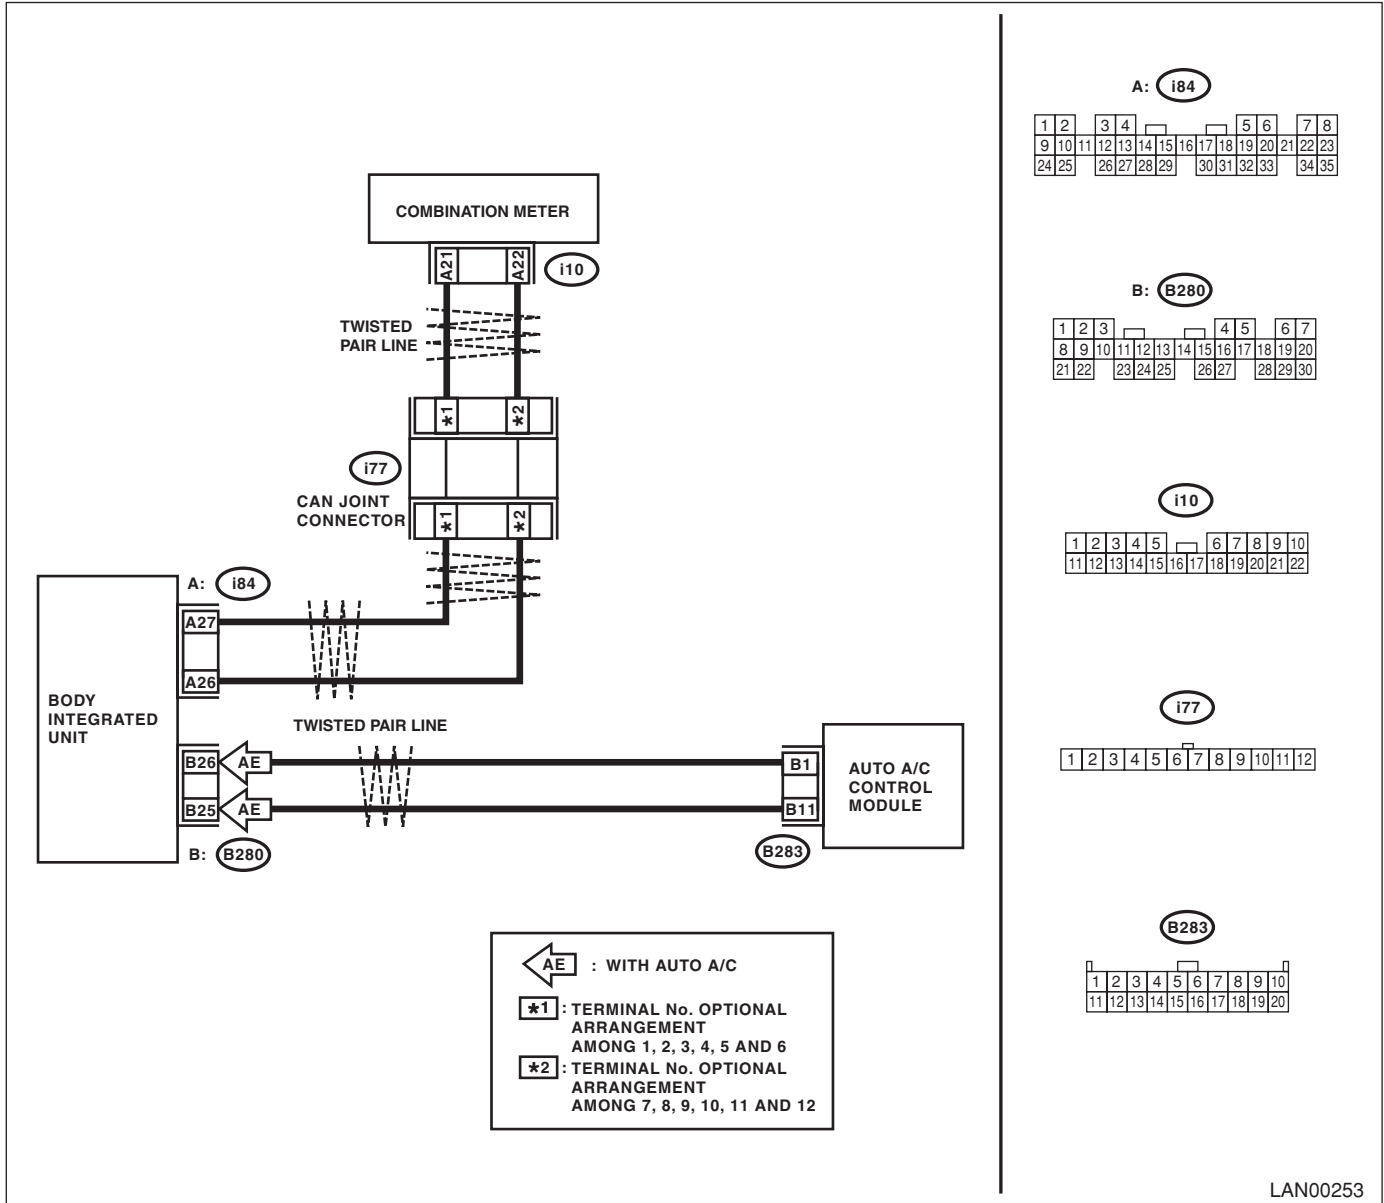

DTC DETECTING CONDITION:

Either end of low-speed CAN communication line is open or shorted, the connector is not connected properly, or the terminal has poor crimping.

TROUBLE SYMPTOM:

"Er LC" is displayed in odo/trip meter, but communicating function is OK.

WIRING DIAGRAM:

Step	Check	Yes	No
1	CHECK DTC. Read the DTC of body integrated unit using Subaru Select Monitor.	Is there any DTC other than B0300?	Perform the diagnosis according to other DTC. Go to step 2.
2	CHECK DTC. Check the DTC displayed in the body integrated unit.	Is the DTC displayed currently malfunctioning?	Check the connection of harness connector. Go to step 3. Go to step 3.
3	CHECK DTC. Turn the ignition switch to OFF and read the DTC again.	Is B0300 displayed currently malfunctioning?	Go to step 4. Temporary poor contact occurs.

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

LAN SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
4 CHECK CURRENT DATA. Connect the Subaru Select Monitor and display current data of the body integrated unit (auto A/C fail).	Is OK displayed?	Go to step 5.	Perform auto A/C self-diagnosis. <Ref. to AC(diag)-10, Diagnostic Chart for Self-Diagnosis, .>,
5 CHECK AUTO A/C ECM. 1) Turn the ignition switch to OFF. 2) Disconnect the auto A/C ECM connector (B283). 3) Turn the ignition switch to ON and read the DTC.	Does B0300 disappear?	Go to step 6.	Go to step 7.
6 CHECK HARNESS. 1) Disconnect the body integrated unit connector (B280) and auto A/C control module connector (B283). 2) Measure the resistance between body integrated unit connector and auto A/C control module connector. Connector & terminal (B283) No. 1 — (B280) No. 26: (B283) No. 11 — (B280) No. 25:	Is the harness in normal condition?	Replace the auto A/C ECM. <Ref. to AC-33, Control Unit (Auto A/C Model), .>	Repair or replace the open circuit of harness.
7 CHECK CURRENT DATA. Connect the Subaru Select Monitor and display current data of the body integrated unit (meter fail).	Is OK displayed?	Go to step 8.	Replace the combination meter. <Ref. to IDI-15, REMOVAL, Combination Meter.>
8 CHECK COMBINATION METER. 1) Turn the ignition switch to OFF. 2) Disconnect the combination meter connector. 3) Turn the ignition switch to ON.	Is B0300 detected?	Go to step 10.	Go to step 9.
9 CHECK HARNESS. 1) Disconnect the combination meter connector (i10). 2) Check for open and short circuits between the body integrated unit and combination meter connectors. Connector & terminal (i10) No. 21 — (i84) No. 27: (i10) No. 22 — (i84) No. 26:	Is the harness in normal condition?	Replace the combination meter. <Ref. to IDI-15, REMOVAL, Combination Meter.>	Repair or replace the open or short circuit of harness.
10 CHECK HARNESS. 1) Disconnect the CAN junction connector (i77) and the body integrated unit connector (i84). 2) Measure the resistance between connector terminals. Connector & terminal (i84) No. 27 — (i77) No. 2: (i84) No. 26 — (i77) No. 8: NOTE: The junction connector of i77 is in user defined alignment.	Is the resistance less than 10 Ω?	Go to step 11.	Repair the short circuit of harness or replace harness.

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

LAN SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
11 CHECK HARNESS. 1) Disconnect the combination meter connector. 2) Measure the resistance between the junction connector and the combination meter connector. <i>Connector & terminal</i> <i>(i10) No. 21 — (i77) No. 1:</i> <i>(i10) No. 22 — (i77) No. 7:</i>	Is the resistance less than 10 Ω ?	Go to step 12.	Repair the open circuit of harness or replace harness.
12 CHECK HARNESS. 1) Disconnect the body integrated unit connector (B280) and auto A/C control module connector (B283). 2) Measure the resistance between body integrated unit connector and auto A/C control module connector. <i>Connector & terminal</i> <i>(B283) No. 1 — (B280) No. 26:</i> <i>(B283) No. 11 — (B280) No. 25:</i>	Is the resistance less than 10 Ω ?	Go to step 13.	Repair the open circuit of harness or replace harness.
13 CHECK HARNESS. 1) Connect the junction connector. 2) Measure the resistance between body integrated unit connector and chassis ground. <i>Connector & terminal</i> <i>(B280) No. 25 — Chassis ground:</i> <i>(B280) No. 26 — Chassis ground:</i> <i>(i84) No. 26 — Chassis ground:</i> <i>(i84) No. 27 — Chassis ground:</i>	Is the resistance less than 10 Ω ?	Repair the short circuit of harness or replace harness.	Go to step 14.
14 CHECK HARNESS. 1) Turn the ignition switch to ON. 2) Measure the voltage between body integrated unit connector and chassis ground. <i>Connector & terminal</i> <i>(B280) No. 25 (+) — Chassis ground (-):</i> <i>(B280) No. 26 (+) — Chassis ground (-):</i> <i>(i84) No. 26 (+) — Chassis ground (-):</i> <i>(i84) No. 27 (+) — Chassis ground (-):</i>	Is the voltage 6 V or more?	Repair the short circuit of harness or replace harness.	Replace the body integrated unit. <Ref. to SL-54, REMOVAL, Body Integrated Unit.>

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

LAN SYSTEM (DIAGNOSTICS)

S: DTC B0301 CAN-LS COUNTER ABNORMAL

DTC DETECTING CONDITION:

Find the unit in which trouble occurs and open or short CAN line, and repair and replace them.

(Free running counter error may be detected at the same time from the unit in which the malfunction occurs.)

TROUBLE SYMPTOM:

“Er LC” is displayed in odo/trip meter.

Step	Check	Yes	No
1	CHECK DTC. Read the DTC of body integrated unit using Subaru Select Monitor.	Is there any DTC other than B0301?	Perform the diagnosis according to other DTC. Go to step 2.
2	CHECK DTC. Check the DTC displayed in the body integrated unit.	Is the DTC displayed currently malfunctioning?	Check the connection of harness connector. Go to step 3. Go to step 3.
3	CHECK DTC. Turn the ignition switch to OFF and read the DTC again.	Is B0301 currently malfunctioning?	Go to step 4. Temporary poor contact occurs.
4	CHECK CURRENT DATA. Connect the Subaru Select Monitor and display current data of the body integrated unit (auto A/C fail).	Is OK displayed?	Go to step 5. Perform auto A/C self-diagnosis. <Ref. to AC(diag)-10, Diagnostic Chart for Self-Diagnosis, .>
5	CHECK AUTO A/C ECM. 1) Turn the ignition switch to OFF. 2) Disconnect the auto A/C ECM connector. 3) Turn the ignition switch to ON.	Does the communications error display disappear?	Go to step 6. Go to step 7.
6	CHECK HARNESS. 1) Disconnect the body integrated unit connector (B280) and auto A/C control module connector (B283). 2) Check for open and short circuits between body integrated unit connector and auto A/C control module connector. Connector & terminal (B283) No. 11 — (B280) No. 26: (B283) No. 1 — (B280) No. 25:	Is the harness in normal condition?	Replace the auto A/C ECM. <Ref. to AC-33, Control Unit (Auto A/C Model), .> Repair or replace the open or short circuit of harness.
7	CHECK CURRENT DATA. Connect the Subaru Select Monitor and display current data of the body integrated unit (meter fail).	Is OK displayed?	Go to step 8. Replace the combination meter. <Ref. to IDI-15, REMOVAL, Combination Meter.>
8	CHECK COMBINATION METER. 1) Turn the ignition switch to OFF. 2) Disconnect the combination meter connector. 3) Turn the ignition switch to ON.	Is B0301 detected?	Go to step 9. Replace the combination meter. <Ref. to IDI-15, REMOVAL, Combination Meter.>
9	CHECK HARNESS. 1) Disconnect the combination meter connector (i10). 2) Check for open and short circuits between the body integrated unit and combination meter connectors. Connector & terminal (i10) No. 21 — (i84) No. 27: (i10) No. 22 — (i84) No. 26:	Is the harness in normal condition?	Go to step 10. Repair or replace the open or short circuit of harness.

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

LAN SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
10 CHECK COMBINATION METER. 1) Display the current data of body integrated unit using Subaru Select Monitor. 2) Display the door switch in analog data. 3) Read the display of data and combination meter when each door is opened/closed.	Do the body integrated unit data indicator and combination meter indicator change according to operation?	Go to step 11.	Go to step 13.
11 CHECK AUTO A/C CONTROL MODULE. 1) Display the current data of body integrated unit using Subaru Select Monitor. 2) Display the number of blower fan levels in the analog data. 3) Read the data display when the number of blower fan levels is changed on air conditioner control part.	Does the data display change?	Go to step 12.	Go to step 14.
12 CHECK AUTO A/C CONTROL MODULE HARNESS. 1) Disconnect the auto A/C control module connector. 2) Disconnect the body integrated unit connector. 3) Measure the resistance between the body integrated unit and auto A/C control module harness. <i>Connector & terminal</i> <i>(B280) No. 26 — (B283) No. 1:</i> <i>(B280) No. 25 — (B283) No. 11:</i>	Is the resistance less than 10 Ω?	Go to step 14.	Repair the open circuit of harness or replace harness.
13 CHECK COMBINATION METER HARNESS. 1) Disconnect the combination meter connector. 2) Disconnect the body integrated unit connector. 3) Measure the resistance between the body integrated unit and combination meter connector. <i>Connector & terminal</i> <i>(i84) No. 27 — (i10) No. 21:</i> <i>(i84) No. 26 — (i10) No. 22:</i>	Is the resistance less than 10 Ω?	Go to step 15.	Repair the open circuit of harness or replace harness.
14 CHECK AUTO A/C CONTROL MODULE. Perform auto A/C control module self-diagnosis. <Ref. to AC(diag)-10, A/C CONTROL SYSTEM SELF-DIAGNOSIS, OPERATION, Diagnostic Chart for Self-Diagnosis.>	Is the self-diagnosis OK?	Go to step 15.	Replace the auto A/C ECM. <Ref. to AC-33, Control Unit (Auto A/C Model), .>
15 CHECK COMBINATION METER. Perform self-diagnosis for the combination meter system. <Ref. to IDI-3, SELF-DIAGNOSIS, INSPECTION, Combination Meter System.>	Is the self-diagnosis OK?	Go to step 16.	Replace the combination meter. <Ref. to IDI-15, REMOVAL, Combination Meter.>
16 CHECK THE BODY INTEGRATED UNIT. Read the data of "body integrated unit data received" on ECM data display using Subaru Select Monitor.	Is the "Yes" displayed?	Go to step 17.	Replace the body integrated unit. <Ref. to SL-54, REMOVAL, Body Integrated Unit.>
17 CHECK THE BODY INTEGRATED UNIT. Read the data of "body integrated unit counter update" on ECM data display using Subaru Select Monitor.	Is the "Yes" displayed?	Temporary poor contact occurs. Check the connection of connector.	Replace the body integrated unit. <Ref. to SL-54, REMOVAL, Body Integrated Unit.>

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

LAN SYSTEM (DIAGNOSTICS)

T: DTC B0302 CAN-LS BUS OFF

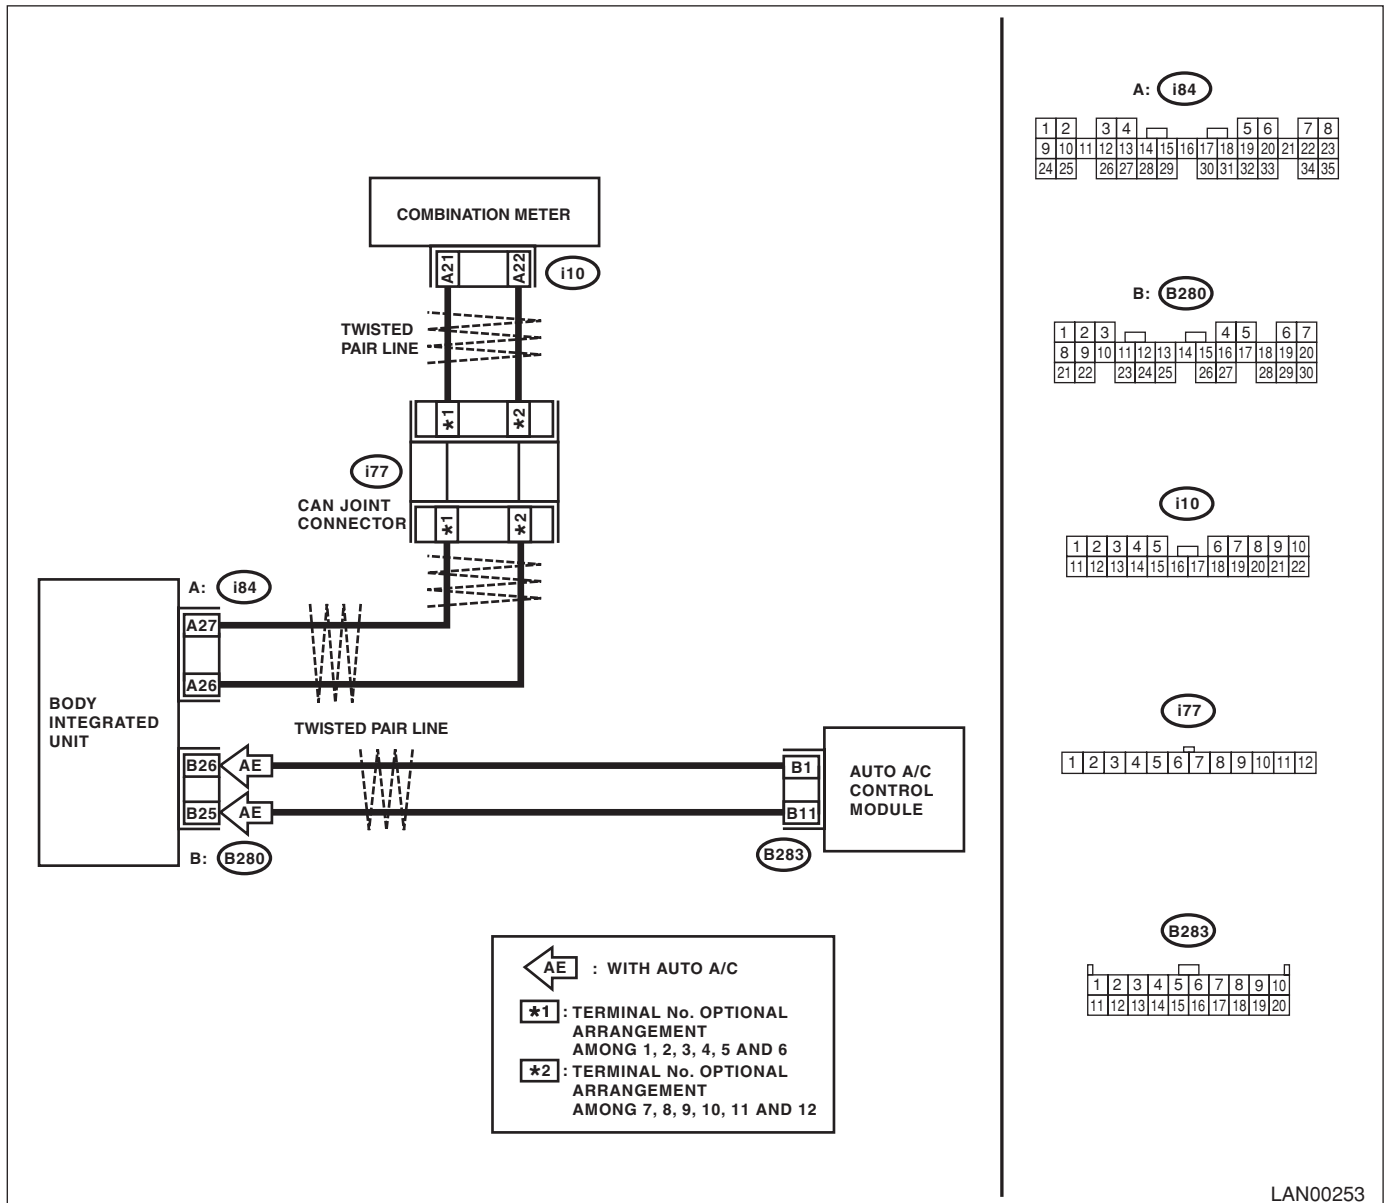

DTC DETECTING CONDITION:

Because of a lot of error data occurred, some units have been disconnected not to affect other units. Communication failure from the unit in which error is occurred is input at the same time.

TROUBLE SYMPTOM:

"Er LC" is displayed in odo/trip meter.

WIRING DIAGRAM:

Step	Check	Yes	No
1	CHECK DTC. Read the DTC of body integrated unit using Subaru Select Monitor.	Is there any DTC other than B0302?	Perform the diagnosis according to other DTC. Go to step 2.
2	CHECK DTC. Check the DTC displayed in the body integrated unit.	Is the DTC displayed currently malfunctioning?	Check the connection of harness connector. Go to step 3.
3	CHECK DTC. Turn the ignition switch to OFF and read the DTC again.	Is B0302 currently malfunctioning?	Go to step 4. Temporary poor contact occurs.

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

LAN SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
4 CHECK CURRENT DATA. Connect the Subaru Select Monitor and display current data of the body integrated unit (auto A/C fail).	Is OK displayed?	Go to step 5.	Perform auto A/C self-diagnosis. <Ref. to AC(diag)-10, OPERATION, Diagnostic Chart for Self-diagnosis.>
5 CHECK AUTO A/C ECM. 1) Turn the ignition switch to OFF. 2) Disconnect the auto A/C ECM connector. 3) Turn the ignition switch to ON.	Does B0302 disappear?	Go to step 6.	Go to step 7.
6 CHECK HARNESS. 1) Disconnect the body integrated unit connector (B280) and auto A/C control module connector (B283). 2) Check for open and short circuits between body integrated unit connector and auto A/C control module connector. Connector & terminal (B283) No. 1 — (B280) No. 26: (B283) No. 11 — (B280) No. 25:	Is the harness in normal condition?	Replace the auto A/C ECM. <Ref. to AC-33, Control Unit (Auto A/C Model), .>	Repair or replace the open or short circuit of harness.
7 CHECK CURRENT DATA. Connect the Subaru Select Monitor and display current data of the body integrated unit (meter fail).	Is OK displayed?	Go to step 8.	Replace the combination meter. <Ref. to IDI-15 REMOVAL, Combination Meter.>
8 CHECK COMBINATION METER. 1) Turn the ignition switch to OFF. 2) Disconnect the combination meter connector. 3) Turn the ignition switch to ON.	Is DTC B0302 detected?	Go to step 9.	Replace the combination meter. <Ref. to IDI-15 REMOVAL, Combination Meter.>
9 CHECK HARNESS. 1) Disconnect the combination meter connector (i10). 2) Check for open and short circuits between the body integrated unit connector and combination meter connector. Connector & terminal (i10) No. 21 — (i84) No. 27: (i10) No. 22 — (i84) No. 26:	Is the harness in normal condition?	Go to step 10.	Repair or replace the open or short circuit of harness.
10 CHECK COMBINATION METER. 1) Display the current data of body integrated unit using Subaru Select Monitor. 2) Display the door switch in analog data. 3) Read the display of data and combination meter when each door is opened/closed.	Do the body integrated unit data indicator and combination meter indicator change according to the operation?	Go to step 11.	Go to step 12.
11 CHECK AUTO A/C CONTROL MODULE HARNESS. 1) Disconnect the auto A/C control module connector. 2) Disconnect the body integrated unit connector. 3) Measure the resistance between the body integrated unit and auto A/C control module harness. Connector & terminal (B280) No. 26 — (B283) No. 1: (B280) No. 25 — (B283) No. 11:	Is the resistance less than 10 Ω ?	Go to step 12.	Repair or replace the open or short circuit of harness.

LAN SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
12 CHECK COMBINATION METER HARNESS. 1) Disconnect the combination meter connector. 2) Disconnect the body integrated unit connector. 3) Measure the resistance between the body integrated unit and combination meter connector. <i>Connector & terminal</i> <i>(i84) No. 27 — (i10) No. 21:</i> <i>(i84) No. 26 — (i10) No. 22:</i>	Is the resistance less than 10 Ω ?	Go to step 13.	Repair the open circuit of harness or replace harness.
13 CHECK AUTO A/C CONTROL MODULE. Perform auto A/C control module self-diagnosis. <Ref. to AC(diag)<Ref. to AC(diag)-10, Diagnostic Chart for Self-Diagnosis, .>	Is the self-diagnosis OK?	Go to step 14.	Replace the auto A/C control module. <Ref. to AC-33, Control Unit (Auto A/C Model), .>
14 CHECK COMBINATION METER. Perform self-diagnosis for the combination meter system. <Ref. to IDI-3, SELF-DIAGNOSIS, INSPECTION, Combination Meter System.>	Is the self-diagnosis OK?	Replace the body integrated unit. <Ref. to SL-54, REMOVAL, Body Integrated Unit.>	Replace the combination meter. <Ref. to IDI-15, REMOVAL, Combination Meter.>

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

LAN SYSTEM (DIAGNOSTICS)

U: DTC B0311 CAN-LS METER UNIT DATA ABNORMAL

DTC DETECTING CONDITION:

Combination meter error, or harness between the main harness splice and combination meter is open or short, the connector is not connected securely and the terminal has poor caulking.

TROUBLE SYMPTOM:

"Er Lc" is displayed in odo/trip meter.

WIRING DIAGRAM:

LAN00153

Step	Check	Yes	No
1 CHECK COMBINATION METER. Perform the self-diagnosis for combination meter. <Ref. to IDI-3, SELF-DIAGNOSIS, INSPECTION, Combination Meter System.>	Is the self-diagnosis OK?	Read the DTC again, and then perform the diagnosis according to DTC displayed on the top.	Replace the combination meter. <Ref. to IDI-15, Combination Meter.>

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

LAN SYSTEM (DIAGNOSTICS)

V: DTC B0321 CAN-LS METER NO-RECEIVE DATA

DTC DETECTING CONDITION:

Combination meter unit error, or harness between the main harness splice and combination meter unit is open or short, the connector is not connected securely and the terminal has poor caulking.

TROUBLE SYMPTOM:

Fail mode occurs because the data is not received from combination meter unit.

WIRING DIAGRAM:

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

LAN SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
1 CHECK COMMUNICATION LINE. 1) Warm up the engine. 2) Compare the data of body integrated unit and combination meter using Subaru Select Monitor. Check item: <ul style="list-style-type: none"> • Engine speed • Each door switch • P switch 	Is the data displayed same?	Go to step 2	Perform the self-diagnosis for combination meter. <Ref. to IDI-3, SELF-DIAGNOSIS, INSPECTION, Combination Meter System.>
2 CHECK HARNESS. 1) Disconnect the body integrated unit, combination meter connector. 2) Measure the resistance between harness connectors. Connector & terminal <i>(i10) No. 21 — (i84) No. 27:</i> <i>(i10) No. 26 — (i84) No. 26:</i>	Is the resistance less than 10 Ω?	Go to step 4	Go to step 3
3 CHECK HARNESS. 1) Disconnect the CAN joint connector (i77) with connector of unit is disconnected. 2) Measure the resistance between harness connector. Connector & terminal <i>(i10) No. 21 — (i77) No. 1:</i> <i>(i10) No. 26 — (i77) No. 7:</i> <i>(i84) No. 27 — (i77) No. 2:</i> <i>(i84) No. 26 — (i77) No. 8:</i>	Is the resistance less than 10 Ω?	Go to step 4	Repair or replace the open circuit of harness.
4 CHECK HARNESS. Measure the resistance between harness connector (i77) and chassis ground. Connector & terminal <i>(i77) No. 1 — Chassis ground:</i> <i>(i77) No. 7 — Chassis ground:</i> <i>(i77) No. 2 — Chassis ground:</i> <i>(i77) No. 8 — Chassis ground:</i>	Is the resistance less than 10 Ω?	Repair or replace the short circuit of harness.	Go to step 5
5 CHECK HARNESS. 1) Turn the ignition switch to ON. 2) Measure the voltage between harness connector (i77) and chassis ground. Connector & terminal <i>(i77) No. 1 (+) — Chassis ground (-):</i> <i>(i77) No. 7 (+) — Chassis ground (-):</i> <i>(i77) No. 2 (+) — Chassis ground (-):</i> <i>(i77) No. 8 (+) — Chassis ground (-):</i>	Is the voltage more than 6 V?	Repair or replace the short circuit of harness.	Go to step 6
6 CHECK COMBINATION METER. Perform the self-diagnosis for combination meter. <Ref. to IDI-3, SELF-DIAGNOSIS, INSPECTION, Combination Meter System.>	Is the self-diagnosis OK?	Temporary poor contact occurs.	Check the connection of connector. Replace the combination meter. <Ref. to IDI-15, Combination Meter.>

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

LAN SYSTEM (DIAGNOSTICS)

W: DTC B0500 KEYLESS UART COM. MALFUNCTION

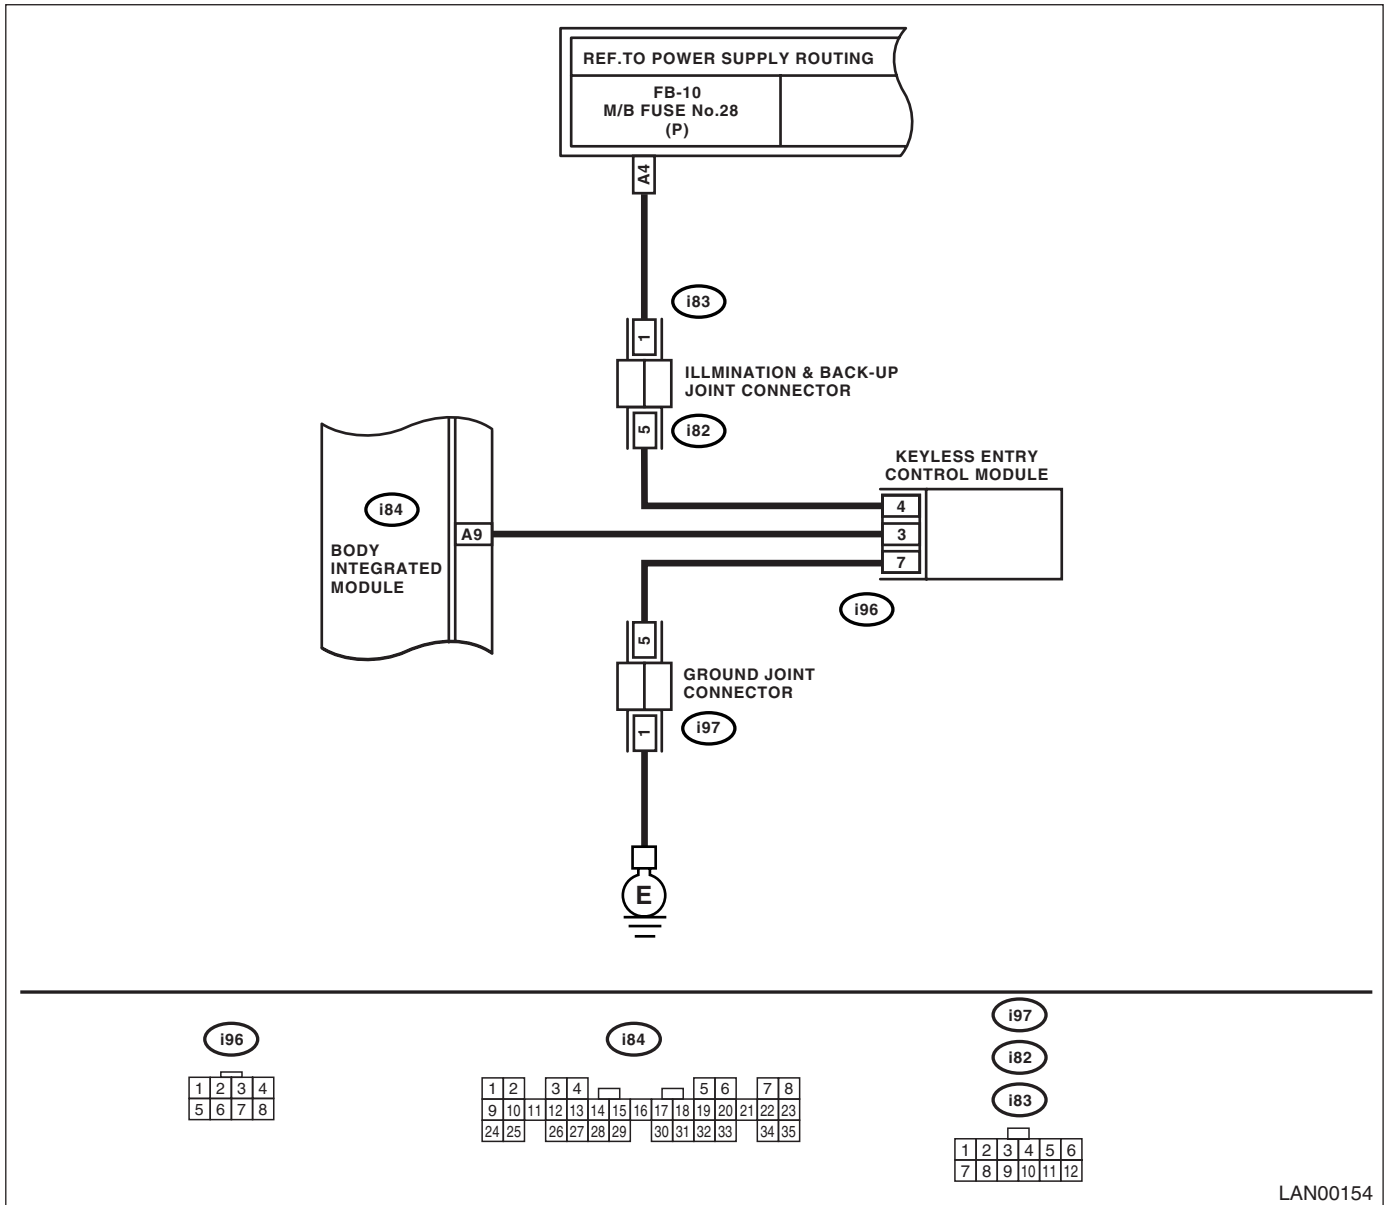

DTC DETECTING CONDITION:

UART between keyless control unit and body integrated unit is open or shorted, connector is not connected securely, the terminal has poor caulking.

TROUBLE SYMPTOM:

Door lock does not operate with keyless.

WIRING DIAGRAM:

Step	Check	Yes	No
1 CHECK HARNESS. 1) Disconnect the body integrated unit connector (i84) and keyless entry control module connector (i96). 2) Measure the resistance between harness. Connector & terminal (i84) No. 9 — (i96) No. 3:	Is the resistance less than 10 Ω?	Go to step 2	Repair or replace the open circuit of harness.

Diagnostic Procedure with Diagnostic Trouble Code (DTC)

LAN SYSTEM (DIAGNOSTICS)

Step	Check	Yes	No
2 CHECK HARNESS. Measure the resistance between harness connector and chassis ground. Connector & terminal (i84) No. 9 — Chassis ground:	Is the resistance less than 1 MΩ?	Repair or replace the short circuit of harness.	Go to step 3
3 CHECK HARNESS. 1) Turn the ignition switch to ON. 2) Measure the voltage between harness connector and chassis ground. Connector & terminal (i84) No. 9 (+) — Chassis ground (-):	Is the voltage more than 6 V?	Repair or replace the short circuit of harness.	Go to step 4
4 OPERATION CHECK. Check the door lock operation when the doors LOCK/UNLOCK using manual LOCK switch.	Does it operate on switch operation?	Go to step 5	Replace the body integrated unit. <Ref. to SL-54, Body Integrated Unit.>
5 OPERATION CHECK. 1) Disconnect the key warning switch connector (B350). 2) Close all the door, and then perform the LOCK/UNLOCK operation on keyless entry operation.	Does it operate?	Check key warning switch.	Replace the keyless entry control module. <Ref. to SL-52, Keyless Entry Control Unit.>

13. General Diagnostic Table

A: INSPECTION

Read the DTC or inspect and diagnose the following data in the current data display using Subaru Select Monitor.

1. LAN SYSTEM

Item	Operation	Specifications		NOTE
		YES	NO	
Diagnostic code	DTC is not displayed when inspecting all DTCs.	DTC is not displayed.	Perform the diagnosis according to DTC.	—
Engine coolant temperature	Check the current data display of ECM, TCM and body integrated unit, and make sure all data have same values.	Same values	Inspect LAN system.	If engine coolant temperature sensor is not OK, inspect the sensor circuit.
R defogger SW	It turns to ON when pressing switch. (Low-speed CAN is OK)	Turns to ON.	Inspect rear defogger switch.	Rear defogger switch is connected with Low-speed CAN.
R defogger output	When switch input, it is output.	Output	Replace the body integrated unit.	If not operate with output, check the rear defogger relay.
Door lock SW	When locked with door lock switch, it turns to ON.	Turns to ON.	Inspect door lock switch.	Door lock switch is connected with Low-speed CAN.
Door lock actuator	When locked with door lock switch, it is output.	Output	Replace the body integrated unit.	—

2. BODY INTEGRATED UNIT

Item	Operation	Specifications		NOTE
		YES	NO	
Illumination VR power supply	Operate the illumination volume, illumination light is controlled with changing of data display voltage.	Illumination light is controlled with changing of data.	Inspect the illumination volume.	—
Fuel level resistance	Check the fuel level resistance and fuel level resistance 2. Both resistances are same.	Same values	Inspect body integrated unit.	Compare the input and output values of body integrated unit.
R wiper SW input	When rear wiper SW to ON, data display turns to ON.	Turns to ON.	Inspect rear wiper switch.	—
R wiper output	When rear wiper switch to ON, output signal turns to ON.	Turns to ON.	Replace the body integrated unit.	If not operate with output turned to ON, check the rear wiper motor.
Keyless Entry	Keyless entry LOCK/UNLOCK the doors.	Operate	Inspect the keyless antenna.	If the antenna is OK, replace the body integrated unit.
Brake SW	When brake pedal is depressed, it turns to ON.	Turns to ON.	Inspect brake switch.	—
Shift lock solenoid	The shift lock releases when depressing the brake pedal.	Released	Inspect the shift lock.	—
Body integrated unit registration function setting	Does Vehicle equipment correspond to setting values?	Correspondence	Reconfigure the values according to vehicle equipment.	—
Customize	When changing customize setting, the registration completes correctly.	Registered	Inspect body integrated unit.	—

General Diagnostic Table

LAN SYSTEM (DIAGNOSTICS)

Item	Operation	Specifications		NOTE
		YES	NO	
Manual mode	Switch the shift (UP/DOWN) on Manual mode. Indicator is changed in 1 — 2.	Change	Inspect the shift lever.	—
Function check	Each checking item operate correctly. (Except for not equipped)	Operate	Inspect for non-functional actuator.	—
Security	After locking with keyless entry system and open the door, security system is armed and the horn sounds.	Horn sounds. (Security system operates.)	Inspect the security system.	—

1. Basic Diagnostic Procedure

A: BASIC PROCEDURES

1. GENERAL DESCRIPTION

The most important purpose of diagnostics is to determine which part is malfunctioning quickly, to save time and labor.

2. IDENTIFICATION OF TROUBLE SYMPTOM

Determine what the problem is based on the symptom.

3. PROBABLE CAUSE OF TROUBLE

Look at the wiring diagram and check the system's circuit. Then check the switch, relay, fuse, ground, etc.

4. LOCATION AND REPAIR OF TROUBLE

- 1) Using the diagnostics, narrow down the causes.
- 2) If necessary, use a voltmeter, ohmmeter, etc.
- 3) Before replacing certain component parts (switch, relay, etc.), check the power supply, ground, for open wiring harness, poor connectors, etc. If no problem is encountered, check the component parts.

5. SYSTEM OPERATION CHECK

After repairing, ensure that the system operates properly.

B: BASIC INSPECTION

1. VOLTAGE MEASUREMENT

- 1) Using a voltmeter, connect the negative lead to a good ground point or negative battery terminal and the positive lead to the connector or component terminal.
- 2) Contact the positive lead of the voltmeter on connector (A). The voltmeter will indicate a voltage.
- 3) Shift the positive lead to connector (B). The voltmeter will indicate no voltage.

- 4) With the test set-up held as it is, turn the switch ON. The voltmeter will indicate a voltage and, at the same time, the light will come on.

- 5) The circuit is in good order. If a problem such as a light failing to illuminate occurs, use the procedures outlined above to track down the malfunction.

2. CIRCUIT CONTINUITY CHECKS

- 1) Disconnect the battery terminal or connector so there is no voltage between the check points. Contact the two leads of an ohmmeter to each of the check points.

If the circuit has diodes, reverse the two leads and check again.

- 2) Use an ohmmeter to check for diode continuity. When contacting the negative lead to the diode positive side and the positive lead to the negative side, there should be continuity.

When contacting the two leads in reverse, there should be no continuity.

- 3) Symbol "○ — ○" indicates that continuity exists between two points or terminals. For example, when a switch position is at "3", continuity exists among terminals 1, 3 and 6, as shown in the table below.

Terminal Switch Position	1	2	3	4	5	6
OFF						
1	○ — ○				○ — ○	
2	○ — ○			○ — ○		○ — ○
3	○ — ○		○ — ○			○ — ○
4	○ — ○	○ — ○				○ — ○

WI-00096

Basic Diagnostic Procedure

WIRING SYSTEM

3. HOW TO DETERMINE AN OPEN CIRCUIT

1) WITH VOLTMETER:

An open circuit is determined by measuring the voltage between respective connectors and ground using a voltmeter, starting with the connector closest to the power supply. The power supply must be turned ON so that current flows in the circuit. If voltage is not present between a particular connector and ground, the circuit between that connector and the previous connector is open.

2) WITH OHMMETER:

Disconnect all connectors affected, and check continuity in the wiring between adjacent connectors. When the ohmmeter indicates "infinite", the wiring is open.

4. HOW TO DETERMINE A SHORT CIRCUIT

1) WITH TEST LIGHT:

Connect a test light (rated at approx. 3 watts) in place of the blown fuse and allow current to flow through the circuit. Disconnect one connector at a time from the circuit. Starting with the one located farthest from the power supply. If the test light goes out when a connector is disconnected, the wiring

between that connector and the next connector (farther from the power supply) is shorted.

2) WITH OHMMETER:

Disconnect all affected connectors, and check continuity between each connector and ground. When the ohmmeter indicates continuity between a particular connector and a ground, that connector is shorted.

C: HOW TO READ WIRING DIAGRAMS

1. WIRING DIAGRAM

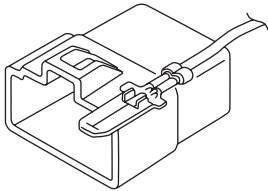

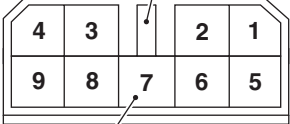

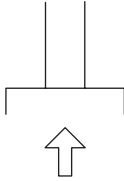

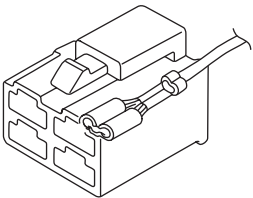

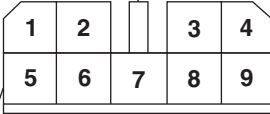

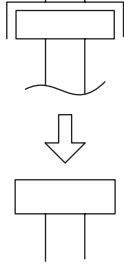

The wiring diagram of each system is illustrated so that you can understand the path through which the electric current flows from the battery.

Sketches and codes are used in the diagrams. They should read as follows:

- Each connector and its terminal position are indicated by a sketch of the connector in a disconnected state which is viewed from the front.

- The number of poles or pins, presence of a lock are indicated in the sketch of each connector. In the sketch, the highest pole number refers to the number of poles which the connector has. For example, the sketch of the connector shown in figure indicates the connector has 9 poles.

Connector used in vehicle	Connector shown in wiring diagram		
	Sketch	Symbol	Number of poles
	<p>Double frames</p> <p>Indicates a lock is included.</p>  <p>Indicates the number of poles.</p>		Numbered in order from upper right to lower left.
	<p>Indicates a lock is included.</p>  <p>Single frame</p>		Numbered in order from upper left to lower right

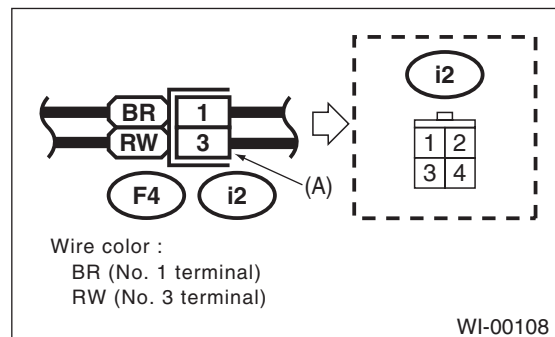

WI-00102

- When one set of connectors is viewed from the front side, the pole numbers of one connector are symmetrical to those of the other. When these two connectors are connected as a unit, the poles which have the same number are joined.

NOTE:

A wire which runs in one direction from a connector terminal sometimes may have a different color from that which runs in the other direction from that terminal.

• WIRING DIAGRAM:

The connectors are numbered along with the number of poles, external colors, and mating connections in the accompanying list.

- The sketch of each connector in the wiring diagram usually shows the (A) side of the connector. The relationship between the wire color, terminal number and connector is described in the figure.

Basic Diagnostic Procedure

WIRING SYSTEM

- In the wiring diagram, connectors which have no terminal number refer to one-pole types. Sketches of these connectors are omitted intentionally.

- The following color codes are used to indicate the colors of the wires.

Color code	Color
L	Blue
B	Black
Y	Yellow
G	Green
R	Red
W	White
Br	Brown
Lg	Light green
Gr	Gray
P	Pink
Or	Orange
Sb	Sky blue
V	Purple
SA	Sealed (Inner)
SB	Sealed (Outer)

- The wire color code, which consists of two letters (or three letters including Br or Lg), indicates the standard color (base color of the wire covering) by its first letter and the stripe marking by its second letter.

- The table lists the nominal sectional areas and allowable currents of the wires.

CAUTION:

When replacing or repairing a wire, be sure to use the same size and type of the wire which was originally used.

NOTE:

- The allowable current in the table indicates the tolerable amperage of each wire at an ambient temperature of 40°C (104°F).
- The allowable current changes with ambient temperature. Also, it changes if a bundle of more than two wires is used.

Nominal sectional area mm ²	No. of strands/ strand diameter	Outside diameter of wiring mm	Allowable current Amps/ 40°C (104°F)
0.3	7/0.26	1.8	7
0.5	7/0.32	2.2 (or 2.0)	12
0.75	30/0.18	2.6 (or 2.4)	16
0.85	11/0.32	2.4 (or 2.2)	16
1.25	16/0.32	2.7 (or 2.5)	21
2	26/0.32	3.1 (or 2.9)	28
3	41/0.32	3.8 (or 3.6)	38
5	65/0.32	4.6 (or 4.4)	51
8	50/0.45	5.5	67

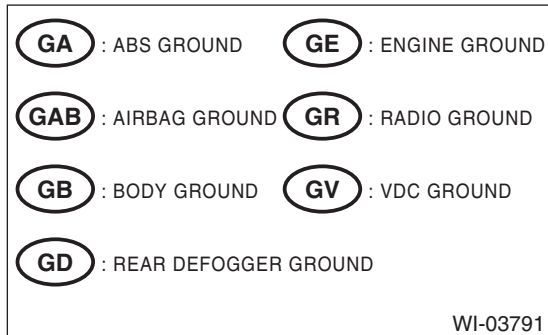

- Each unit is either directly grounded to the body or indirectly grounds through a harness ground terminal. Different symbols are used in the wiring diagram to identify the two grounding systems.

- The ground points shown in the wiring diagram refer to the following:

NOTE:

All wiring harnesses are provided with a ground point which should be securely connected.

Basic Diagnostic Procedure

WIRING SYSTEM

- Relays are classified as normally-open or normally-closed. The normally-closed relay has one or more contacts. The wiring diagram shows the relay mode when the energizing circuit is OFF.

Key to symbols:

○ —▶ : Current flows.

× —▶ : Current does not flow.

WI-00114

- Each connector number shown in the wiring diagram corresponds to that in the wiring harness. The location of each connector in the actual vehicle is determined by reading the first character of the connector (for example, a "F" for F8, "i" for i16, etc.) and the type of wiring harness. The first character of each connector number corresponds to the area or system of the vehicle.

Symbol	Wiring harness and cord
F	Front wiring harness
B	Bulkhead wiring harness
E	Engine wiring harness
T	Transmission cord
D	Door cord LH & RH, Rear gate cord Rear door cord LH & RH, Rear defogger cord
i	Instrument panel wiring harness
R	Rear wiring harness, Fuel tank cord, Roof cord, Rear gate cord, Rear defogger ground cord (Sedan model)
AB	Airbag wiring harness

Basic Diagnostic Procedure

WIRING SYSTEM

D: SYMBOLS IN WIRING DIAGRAMS

A number of symbols are used in each wiring diagram to easily identify parts or circuits.

1. RELAY

A symbol used to indicate a relay.

2. CONNECTOR 1

The sketch of the connector indicates the one-pole types.

3. WIRING CONNECTION

Some wiring diagrams are indicated in foldouts for convenience. Wiring destinations are indicated where necessary by corresponding symbols. (When two pages are needed for clear indication)

4. FUSE No. & RATING

The "FUSE No. & RATING" corresponds with that used in the fuse box (main fuse box, fuse and joint box).

5. CONNECTOR 2

- Each connector is indicated by a symbol.
- Each terminal number is indicated in the corresponding wiring diagram in an abbreviated form.
- For example, terminal number "G4" refers to No. 4 terminal of connector (G: F41) shown in the connector sketch.

6. CONNECTOR SKETCH

- Each connector sketch clearly identifies the shape and color of a connector as well as terminal locations. Non-colored connectors are indicated in natural color.
- When more than two types of connector number are indicated in a connector sketch, it means that the same type connectors are used.

7. GROUND

Each grounding point can be located easily by referring to the corresponding wiring harness.

8. DIODE

A symbol is used to indicate a diode.

9. WIRE TRACING ON EXTENDED WIRING DIAGRAMS

For a wiring diagram extending over at least two pages, a symbol (consisting of the same characters with arrows), facilitates wire tracing from one page to the next.

A ↔ A, B ↔ B

10. SYMBOLS OF WIRE CONNECTION AND CROSSING

11. POWER SUPPLY CIRCUIT

A symbol is used to indicate the power supply in each wiring diagram.

“MB-5”, “MB-6”, etc., which are used as power-supply symbols throughout the text, correspond with those shown in the “POWER SUPPLY CIRCUIT” in the wiring diagram.

Accordingly, using the “POWER SUPPLY CIRCUIT” and wiring diagrams permits service personnel to understand the entire electrical arrangement of a system.

12. CLASSIFICATION BY SPECIFICATION

When the wiring diagram differ according to vehicle specifications, the specification difference is described by using abbreviations.

13. HARNESS REPAIR KIT

The connector adapting to Harness repair kit is shown as “HR” in the right-upper of connector number.

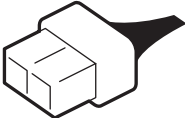

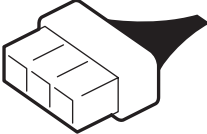

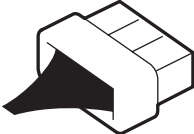

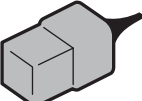

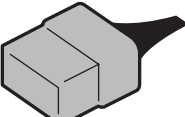

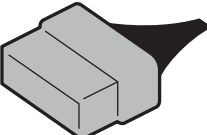

Refer to “Harness Repair Kit” for harness repair kit. <Ref. to WI-220, SPECIFICATION, Harness Repair Kit.>

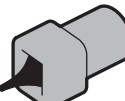

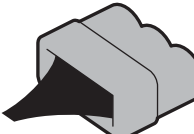

Basic Diagnostic Procedure

WIRING SYSTEM

E: CONNECTOR SYMBOL IN WIRING HARNESS

A number of connector symbols are used in each wiring diagram to easily identify the wiring harness connectors.

Standard type: Female		
Pole: From 1 to 8	Pole: From 9 to 20	Pole: More than 21
		
		
Standard type: Male		
		
		

Water proof type: Female		
Pole: From 1 to 8	Pole: From 9 to 20	Pole: More than 21
		
		
Water proof type: Male		
		
		

Basic Diagnostic Procedure

WIRING SYSTEM

F: ABBREVIATION IN WIRING DIAGRAMS

Abbr.	Full name
ABS	Antilock Brake System
ACC	Accessory
A/C	Air conditioner
AD	Auto Down
AT	Automatic transmission
AU	Auto Up
A/B	Airbag
A/F	Air/Fuel (Air fuel ratio sensor)
ATF	Automatic transmission fluid
AWD	All Wheel Drive
B, BAT	Battery
CPC	Canister Purge Control
D	Drive Range
DN	Down
E	Ground
ELR	Emergency Locking Retractor
F/B	Fuse & Relay box
FL1.5	Fusible Link 1.5 mm ²
H/L	Headlight
I/F	Interface
IG	Ignition
Illumi.	Illumination
INT	Intermittent
LH	Left Hand
Lo	Low
M	Motor
M/B	Main fuse box
MG	Magnet
Mi	Middle
MT	Manual transmission
N	Neutral Range
OCV	Oil flow control solenoid valve
OP	Optional Parts or Open
P	Parking Range
PASS	Passing
R	Reverse Range
RH	Right Hand
SBF	Slow Blow Fuse
ST	Starter
SW	Switch
TGV	Tumble generated valve
U, UP	Up
VDC	Vehicle Dynamics Control
VVL	Variable Valve Lift
WASH	Washer

2. Working Precautions

A: PRECAUTIONS WHEN WORKING WITH THE PARTS MOUNTED ON THE VEHICLE

- 1) When working under a vehicle which is jacked-up, always be sure to use rigid rack.
- 2) The parking brake must always be applied during working. Also, in automatic transmission vehicles, keep the select lever set to the P (Parking) range.
- 3) Be sure the workshop is properly ventilated when running the engine. Further, be careful not to touch the belt or fan while the engine is operating.
- 4) Be careful not to touch hot metal parts, especially the radiator and exhaust system immediately after the engine has been turned off.

B: PRECAUTIONS IN TROUBLE DIAGNOSIS AND REPAIR OF ELECTRIC PARTS

- 1) The battery cable must be disconnected from the battery's (-) terminal, and the ignition switch must be set to the OFF position, unless otherwise required by the diagnostics.
- 2) Securely fasten the wiring harness with clamps and slips so that the harness does not interfere with the body end parts or edges and bolts or screws.
- 3) When installing parts, be careful not to catch them on the wiring harness.
- 4) When disconnecting a connector, do not pull the wires, but pull while holding the connector body.

- 5) Some connectors are provided with a lock. One type of such a connector is disconnected by pushing the lock, and the other, by moving the lock up. In either type the lock shape must be identified before attempting to disconnect the connector.

To connect, insert the connector until it snaps and confirm that it is tightly connected.

- 6) When checking continuity between connector terminals, or measuring voltage across the terminal and ground, always contact tester probe(s) on terminals from the wiring connection side. If the probe is too thick to gain access to the terminal, use "mini" test leads.

To check water-proof connectors (which are not measurable from the wiring side), contact test probes on the terminal side. Be careful not to bend or damage the terminals.

- 7) Sensors, relays, electrical unit, etc., are sensitive to strong impacts. Handle them with care so that they are not dropped or mishandled.

WIRING SYSTEM

GENERAL

FUEL INJECTION (FUEL SYSTEM)

1. General

- The Multipoint Fuel Injection (MFI) system supplies optimum air-fuel mixture under every engine operating condition through the use of the latest electronic control technology.

This system pressurizes the fuel to a constant pressure and injects it into each intake air port in the cylinder head. The injection quantity of fuel is controlled by an intermittent injection system where an electro-magnetic injection valve or injector opens for a short period that is precisely controlled depending on the quantity of air appropriate for each condition of operation. In actual control, an optimum fuel injection quantity is achieved by varying the duration of an electric pulse applied to the injector. This way of control enables simple, yet highly precise metering of the fuel.

- The engine control module (ECM) that controls the fuel injection system corrects the fuel injection amount depending on the vehicle speed, throttle opening, coolant temperature and other vehicle-operation-related information. The ECM receives the information in the form of electric signals from the corresponding sensors and switches.

The MFI system also has the following features:

- Reduced exhaust emissions
- Improves fuel efficiency
- Increased engine output
- Quick response to accelerator and brake pedal operation
- Superior start ability and warm-up performance in cold weather due to corrective controls made according to coolant and intake air temperatures

2. Air Line

A: GENERAL

The air filtered by the air cleaner enters the throttle body where it is regulated in the volume by the throttle valve and then enters the intake manifold. It is then distributed to each cylinder where the air is mixed with fuel injected by the injector.

B: MANIFOLD ABSOLUTE PRESSURE SENSOR

The manifold absolute pressure sensor is attached to the top of the throttle body, and continuously sends to the engine control module (ECM) voltage signals that are proportional to intake manifold absolute pressures. The ECM controls the fuel injection and ignition timing based on the intake manifold absolute pressure signals in addition to other signals from many sensors and other control modules.

- (B) Absolute pressure

AIR LINE

FUEL INJECTION (FUEL SYSTEM)

C: ELECTRONIC CONTROL THROTTLE SYSTEM

- The electronic control throttle system consists of an accelerator pedal position sensor mounted on the accelerator pedal, a throttle position sensor and a throttle motor mounted on the throttle body, and the ECM, which controls these devices.
- The movement of the accelerator pedal is converted into electrical signals by the accelerator pedal position sensor and sent to the ECM. Based on these signals the ECM controls the throttle motor to open and close the throttle valve.
- Idling control is now performed by the electronic control throttle system in place of the idle air control solenoid valve.

D: MASS AIR FLOW AND INTAKE AIR TEMPERATURE SENSOR

NOTE:

Not installed on some models.

The mass air flow and the intake air temperature sensors are integrated into a single unit. The unit is mounted on the air cleaner case and measures the amount as well as the temperature of the intake air.

The measured amount and temperature are converted into electrical signals and sent to the ECM. The ECM uses these signals to control injection and ignition timing as well as the fuel injection amount.

- (1) Mass air flow sensor
- (2) Intake air temperature sensor

(A) Air

AIR LINE

FUEL INJECTION (FUEL SYSTEM)

E: TUMBLE GENERATOR VALVE

NOTE:

This is not installed on some models.

- A tumble generator valve is provided on the intake manifold of each engine bank. The right bank tumble generator valve has butterfly valves for the #1 and #3 cylinders and the left bank tumble generator valve has those for the #2 and #4 cylinders. The two butterfly valves in each tumble generator valve are fitted on a single shaft that is driven by an actuator.

- The tumble generator valves are controlled by the ECM according to the coolant temperature and the time elapsed after start of the engine. When the engine is started, the butterfly valves are moved to the closing ends. In this state, the intake air flows at very high speeds passing through narrowed passages in the directions determined by the individual intake air ports in the cylinder head. This creates tumbling air motions in the cylinders, which enables lean mixtures to be ignited and thus harmful exhaust emissions to be reduced during engine start. The tumble generator valves are fully open when the engine is operating at an ordinary driving speed, allowing intake air to flow without being changed in direction and velocity.

3. Fuel System

A: GENERAL

- The fuel pressurized by the fuel tank inside pump is delivered to each fuel injector through the fuel filter. Fuel injection pressure is regulated to an optimum level by the pressure regulator.
- Each injector injects fuel into the intake port of the corresponding cylinder where the fuel is mixed with air. The mixture then enters the cylinder. Fuel injection amount and timing are regulated by the ECM.

FU-02409

FUEL SYSTEM

FUEL INJECTION (FUEL SYSTEM)

B: PRESSURE REGULATOR

The pressure regulator is installed at the injector end of the fuel supply line. It has a fuel chamber and spring chamber separated by a diaphragm. The fuel chamber is connected to the fuel supply line and the spring chamber is connected to the intake manifold. Fuel chamber also has a relief valve connected to the fuel return line through which fuel returns to the fuel tank. When the intake manifold vacuum increases, the diaphragm is pulled and the relief valve opens to decrease the fuel supply line pressure (or fuel injection pressure). When the intake manifold vacuum decreases, the diaphragm is pushed by the spring to increase the fuel supply line pressure. Thus, the difference between the fuel injection pressure and the intake manifold vacuum is kept at a constant level to precisely control the amount of injected fuel.

FU-02410

- (1) Relief valve
- (2) Diaphragm

- (A) To intake manifold
- (B) Fuel IN
- (C) Fuel OUT

C: FUEL INJECTOR

- The MFI system employs top feed type fuel injectors.
- Each injector is installed in the fuel pipe in such a way that the injector is cooled by fuel.
- The features of this type of fuel injector are as follows:
 - 1) High heat resistance
 - 2) Low driving noise
 - 3) Easy to service
 - 4) Small size
- The injector injects fuel according to the valve open signal from the ECM. The needle valve is lifted by the solenoid, which is energized on arrival of the valve open signal.
- Since the injector's nozzle hole area, the lift of valve and the fuel pressure are kept constant, the amount of fuel injected is controlled only by varying the duration of the valve open signal from the ECM.
- The multi-hole nozzle makes it possible for the injector to produce fine fuel particles, which enhances the combustion efficiency and output performance of the engine.

FUEL SYSTEM

FUEL INJECTION (FUEL SYSTEM)

D: FUEL TANK

The fuel tank utilizes a two-compartment design to ensure sufficient capacity without interfering with the rear differential. It is provided with a suction jet pump (included in the fuel pump and fuel level sensor assembly) which transfers fuel from one compartment to the other.

Each compartment has an individual fuel level sensor. The fuel tank is located under the rear seat and secured with hold-down bands.

- (1) Fuel pump and fuel level sensor assembly
- (2) Fuel sub level sensor
- (3) Band

- (4) Cushion
- (5) Steel

E: FUEL PUMP AND FUEL LEVEL SENSOR ASSEMBLY

1. FUEL PUMP

The fuel pump consists of a motor, impeller, pump casing, pump cover, check valve and filter. It is located in the fuel tank and combined with the fuel level sensor into a single unit. The operation of this impeller type pump is very quiet.

- When the ignition switch is turned ON, fuel pump relay is activated. Then the motor operates to rotate the impeller.
- As the impeller rotates, fuel in a vane groove of the impeller flows along the fuel passage into the next vane groove by centrifugal force. When fuel flows from one groove to the next, a pressure difference occurs due to friction. This creates a pumping effect.
- The fuel pushed up by rotation of the impeller then passes through the clearance between the armature and the magnet of the motor and is discharged through the check valve.
- When the fuel discharge pressure reaches the specified level, the relief valve opens and excess fuel is released into the fuel tank. In this manner, the relief valve prevents an abnormal increase in fuel pressure.
- When the engine and the fuel pump stop, check valve operates to close the discharge port, so that the fuel pressure in the fuel delivery line is retained.

2. FUEL LEVEL SENSOR

The fuel level sensor is integrated with the fuel pump, which is located in the fuel tank. The sensor outputs an electric resistance signal that varies with movement of its float to indicate the level of the fuel remaining in the tank.

- (3) Float
- (4) Fuel temperature sensor

FUEL SYSTEM

FUEL INJECTION (FUEL SYSTEM)

3. JET PUMP

- The jet pump utilizes the velocity of fuel returning from the engine to produce vacuum in it.
- Using the pumping effect produced by the vacuum, the jet pump transfers fuel from the sub-compartment and main compartment of the fuel tank to the fuel pump.
- When the return line nozzle is clogged, the fuel sent back through the return line flows back into the fuel tank via the relief valve.

FU-00226

- (1) Relief valve
- (2) Nozzle

(A) Return line

4. FUEL FILTER

The fuel filter is integrated with the fuel pump assembly, which is located in the fuel tank.

F: SUB-COMPARTMENT FUEL LEVEL SENSOR

This sensor detects the level of the fuel in the sub side (the side without a fuel pump) of the fuel tank. Also, when the jet pump is operating, fuel in the sub side is drawn up and transferred to the fuel pump.

- (1) Fuel level sensor
- (2) Float

(A) To jet pump

SENSORS AND SWITCHES

FUEL INJECTION (FUEL SYSTEM)

4. Sensors and Switches

A: FRONT OXYGEN (A/F) SENSOR

- The front oxygen sensor uses zirconium oxide (ZrO_2), which is a solid electrolyte, at portions exposed to exhaust gas.
- The zirconium oxide has the property of generating electromotive force when its both sides are exposed to oxygen ions of different concentration and the magnitude of this electromotive force depends on how much the difference is.
The front oxygen (A/F) sensor detects the amount of oxygen in exhaust gases by making use of this property of the zirconium oxide material.
- The sensor incorporates a ceramic heater to improve its performance at low temperatures.

FU-02014

- (1) Protection tube
- (2) Gasket
- (3) Sensor housing
- (4) Ceramic heater

SENSORS AND SWITCHES

FUEL INJECTION (FUEL SYSTEM)

- When rich air-fuel mixture is burnt in the cylinder, the oxygen in the exhaust gases is almost completely used in the catalytic reaction by the platinum coating on the external surface of the zirconium tube. This results in a very large difference in the oxygen ion concentration between the inside and outside of the tube, and the electromotive force generated is large.
- When a lean air-fuel mixture is burnt in the cylinder, relatively large amount of oxygen remains in the exhaust gases even after the catalytic action, and this results in a small difference in the oxygen ion concentration between the tube's internal and external surfaces. The electromotive force in this case is very small.
- The difference in oxygen concentration changes drastically in the vicinity of the stoichiometric air-fuel ratio, and hence the change in the electromotive force is also large. By using this information, the ECM can determine the air-fuel ratio of the supplied mixture easily. The front oxygen (A/F) sensor does not generate much electromotive force when the temperature is low. The output characteristics of the sensor stabilize at a temperature of approximately 700°C (1,292°F).

FU-02015

- (B) Air/fuel ratio
- (C) Rich
- (D) Lean

SENSORS AND SWITCHES

FUEL INJECTION (FUEL SYSTEM)

B: FRONT OXYGEN SENSOR AND REAR OXYGEN SENSOR

NOTE:

The front oxygen sensor is not installed on some models.

- The front oxygen sensor and rear oxygen sensor are used to sense oxygen concentration in the exhaust gas. If the air-fuel ratio is leaner than the stoichiometric ratio in the mixture (i.e., excessive amount of air), the exhaust gas contains more oxygen. To the contrary, if the fuel ratio is richer than the stoichiometric ratio, the exhaust gas contains almost no oxygen.
- Detecting the oxygen concentration in exhaust gas using the front oxygen sensor and rear oxygen sensor makes it possible to determine whether the air-fuel ratio is leaner or richer than the stoichiometric ratio.
- The front oxygen sensor and the rear oxygen sensor have a zirconium tube (ceramic), which generates voltage if there is a difference in oxygen ion concentration between the inside and outside of the tube. Platinum is coated on the inside and outside of the zirconium tube as a catalysis and electrode material. The sensor housing is grounded to the exhaust pipe and the inside is connected to the ECM through the harness.
- A ceramic heater is employed to improve performance at low temperatures.

SENSORS AND SWITCHES

FUEL INJECTION (FUEL SYSTEM)

C: ENGINE COOLANT TEMPERATURE SENSOR

The engine coolant temperature sensor is located on the engine coolant pipe. The sensor uses a thermistor whose resistance changes inversely with temperature. Resistance signals as engine coolant temperature information are transmitted to the ECM to make fuel injection, ignition timing, purge control solenoid valve and other controls.

FU-02017

- (1) Connector
- (2) Thermistor element

- (A) Resistance ($k\Omega$)
- (B) Temperature $^{\circ}\text{C}$ ($^{\circ}\text{F}$)

D: CRANKSHAFT POSITION SENSOR

- The crankshaft position sensor is installed on the oil pump, which is located in the front center portion of the cylinder block. The sensor generates a pulse when one of the teeth on the perimeter of the crankshaft sprocket (rotating together with the crankshaft) passes in front of it. The ECM determines the crankshaft angular position by counting the number of pulses.
- The crankshaft position sensor is a molded type, which consists of a magnet, core, coil, terminals and other components as illustrated below.

FU-00234

- (1) Terminal
- (2) Yoke core
- (3) Magnet

- (4) Coil
- (5) Core
- (6) Cover

SENSORS AND SWITCHES

FUEL INJECTION (FUEL SYSTEM)

- As the crankshaft rotates, each tooth aligns with the crankshaft position sensor. At that time, the magnetic flux in the sensor's coil changes since the air gap between the sensor pickup and the sprocket changes. This change in magnetic flux induces a voltage pulse in the sensor and the pulse is transmitted to the ECM.

FU-00354

- (1) Crankshaft position sensor
- (2) Crankshaft sprocket
- (3) Crankshaft half rotation

E: CAMSHAFT POSITION SENSOR

- The camshaft position sensor is located on the left-hand camshaft support. This sensor detects the combustion cylinder at any given moment.
- The sensor generates a pulse when one of the bosses on the back of the left-hand camshaft drive sprocket passes in front of the sensor. The ECM determines the camshaft angular position by counting the number of pulses.

Internal construction and the basic operating principle of the camshaft position sensor are similar to those of the crankshaft position sensor.

- (3) Air gap

- (4) Camshaft position sensor
- (5) Boss
- (6) Camshaft one rotation (crankshaft two rotations)

SENSORS AND SWITCHES

FUEL INJECTION (FUEL SYSTEM)

F: KNOCK SENSOR

- The knock sensor is installed on the cylinder block, and senses knocking that occur in the engine.
- The sensor is a piezo-electric type, which converts vibration resulting from knocking into electric signals.
- In addition to a piezo-electric element, the sensor has a weight and case as its components. If knocking occurs in the engine, the weight in the case moves causing the piezo-electric element to generate a voltage.
- The knock sensor harness is connected to the engine harness.

FU-00356

- (1) Nut
- (2) Weight
- (3) Piezo-electric element
- (4) Housing
- (5) Resistance

G: VEHICLE SPEED SENSOR

Vehicle speed signals are sent from the vehicle speed sensor to the ABS and VDC control modules. The signals are sent to the ECM via CAN communication. (For details, refer to the LAN section.)
<Ref. to LAN section.>

5. Control System

A: GENERAL

The ECM receives signals from various sensors, switches, and other control modules. Using these signals, it determines the engine operating conditions and if necessary, emits signals to one or more systems to control them for optimum operation.

Major control items of the ECM are as follows:

- Fuel injection control
- Ignition control
- Idle air control
- Fuel pump control
- Canister purge control*¹
- Radiator fan control*²
- On-board diagnosis function

*1: Canister purge control is described under EC(H4SO) — Evaporative Emission Control System. <Ref. to EC(H4SO) section.>

*2: Radiator fan control is described under CO(H4SO). <Ref. to CO(H4SO) section.>

CONTROL SYSTEM

FUEL INJECTION (FUEL SYSTEM)

B: INPUT AND OUTPUT SIGNALS

Signal	Unit	Function
Input signals	Manifold absolute pressure sensor	Detects the pressure of intake air (measures the absolute pressure).
	Mass air flow and intake air temperature sensor	Detects the temperature and amount of intake air.
	Throttle position sensor	Detects the throttle valve position.
	Front oxygen (A/F) sensor	Detects the density of oxygen in exhaust gases at the upstream of the front catalytic converter.
	Front oxygen sensor Rear oxygen sensor	Detects the density of oxygen in exhaust gases at the downstream of the front catalytic converter.
	Crankshaft position sensor	Detects the crankshaft angular position.
	Camshaft position sensor	Detects the combustion cylinder.
	Engine coolant temperature sensor	Detects the engine coolant temperature.
	Knock sensor	Detects engine knocking.
	Accelerator pedal position sensor	Indicates the accelerator pedal position.
	Ignition switch	Detects operation of the ignition switch.
	Starter switch	Detects the condition of engine cranking.
	Neutral position switch (MT)	Detects that the gear is in neutral.
	Inhibitor switch (AT)	Detects shift positions.
	A/C switch	Detects ON-OFF operation of the A/C switch.
	Fuel temperature sensor	Detects the temperature of the fuel in the fuel tank.
	Fuel level sensor	Detects the level of the fuel in the fuel tank.
	Fuel tank pressure sensor	Detects the evaporation gas pressure in the fuel tank.
	A/C mid pressure switch	Detects operation of the A/C mid pressure switch.
	Wiper switch	Detects ON-OFF operation of the wiper switch.
	Power steering switch	Detects operation of the power steering switch.
	Small light switch	Detects ON-OFF operation of the small light switch.
	Blower fan switch	Detects ON-OFF operation of the blower fan switch.
Rear defogger switch	Detects ON-OFF operation of the rear defogger switch.	

CONTROL SYSTEM

FUEL INJECTION (FUEL SYSTEM)

Signal	Unit	Function
Output signals	Fuel injector	Activates an injector.
	Ignition signal	Turns the primary current to the ignition coil ON or OFF.
	Electronic control throttle	Controls motor output for the electronic control throttle.
	Fuel pump relay	Turns ON or OFF the fuel pump relay.
	A/C control relay	Turns ON or OFF the A/C control relay.
	Radiator fan control relay	Turns ON or OFF the radiator fan control relay.
	Tumble generator valve actuator	Operates the tumble generator valve.
	Engine warning light	Indicates existence of abnormality.
	Purge control solenoid valve	Controls purge of evaporative gas absorbed by the canister.
	EGR valve	Adjusts the exhaust gas circulating flow to the intake pipe.
	Heater circuit of front and rear oxygen sensors	Controls heater of front and rear oxygen sensors.
	Pressure control solenoid valve	Controls evaporation pressure in the fuel tank.
	Drain valve	Closes the evaporation line between the fuel tank and canister to detect leakage of evaporation gas.
	Power supply	Controls ON/OFF of the main power supply relay.

CONTROL SYSTEM

FUEL INJECTION (FUEL SYSTEM)

C: FUEL INJECTION CONTROL

- The ECM receives signals from various sensors and based on them, it determines the amount of fuel injected and the fuel injection timing. It performs the sequential fuel injection control over the entire engine operating range except during start-up of the engine.
- The amount of fuel injected depends upon the length of time the injector stays open. The fuel injection duration is determined according to varying operating condition of the engine. For the purpose of achieving highly responsive and accurate fuel injection duration control, the ECM performs a new feedback control that incorporates a learning feature as detailed later.
- The sequential fuel injection control is performed such that fuel is injected accurately at the time when the maximum air intake efficiency can be achieved for each cylinder (i.e., fuel injection is completed just before the intake valve begins to open).

1. FUEL INJECTION DURATION

Fuel injection duration is basically determined as indicated below:

- While cranking the engine:

The duration defined below is used.

- Duration of fuel injection during engine start-up Determined according to the engine coolant temperature detected by the engine coolant temperature sensor.

- During normal operation:

The duration is determined as follows:

Basic duration of fuel injection \times Correction factors + Voltage correction time

- Basic duration of fuel injection The basic length of time fuel is injected. This is determined by two factors — the amount of intake air detected by the air flow sensor and the engine speed monitored by the crankshaft position sensor.
- Correction factors See the next section.
- Voltage correction time This is added to compensate for the time lag before operation of injector that results from variation in the battery voltage.

2. CORRECTION FACTORS

The following factors are used to correct the basic duration of fuel injection in order to make the air-fuel ratio meet the requirements of varying engine operating conditions:

- Air-fuel ratio feedback factor:

This factor is used to correct the basic duration of fuel injection in relation to the actual engine speed. (See the next section for more details.)

- Start increment factor:

This factor is used to increase the fuel injection duration only while the engine is being cranked to improve its start ability.

- Coolant-temperature-dependent increment factor:

This factor is used to increase the fuel injection duration depending on engine coolant temperature signals to facilitate cold starting. The lower the coolant temperature, the greater becomes the increment.

- After-start increment factor:

- This factor is used to increase the fuel injection duration for a certain period immediately after start of the engine to stabilize engine operation.
- The increment depends on the coolant temperature at the start of the engine.

- **Wide-open-throttle increment factor:**

This factor is used to increase the fuel injection duration depending on the relationship between the throttle position sensor signal and air flow sensor signal.

- **Acceleration increment factor:**

This factor is used to increase the fuel injection duration to compensate for a time lag between air flow measurement and fuel injection control for better engine response to driver's pedal operation during acceleration.

3. AIR-FUEL RATIO FEEDBACK FACTOR

The ECM creates this factor utilizing the front oxygen (A/F) sensor signal. When the signal is high, the air-fuel ratio is leaner than the stoichiometric ratio. The ECM then makes the fuel injection duration longer by modifying the factor. When the signal is low showing that the mixture is rich, the ECM modifies the factor to make the injection duration shorter. In this way, the air-fuel ratio is maintained at a level close to the stoichiometric ratio at which the three-way catalytic converter acts most effectively.

FU-00240

- (2) Exhaust gases
- (3) Front oxygen (A/F) sensor
- (4) Fuel injector
- (5) Combustion chamber
- (6) ECM

- (A) Injection duration increment signal
- (B) Injection duration decrement signal
- (C) High oxygen density
- (D) Low oxygen density
- (E) Lean signal
- (F) Rich signal

4. LEARNING FEATURE

The air-fuel ratio feedback control includes a learning feature, which contributes to more accurate and responsive control.

- In the air-fuel ratio feedback control, the ECM calculates the necessary amount of correction based on data from the front oxygen (A/F) sensor and adds the result to the basic duration (which is stored in the ECM's memory for each condition defined by the engine speed and various loads.)
- Without a learning feature, the ECM carries out the above-mentioned process every time. This means that if the amount of necessary correction is large, the air-fuel ratio feedback control becomes less responsive and less accurate.
- The learning feature enables the ECM to store the amount of correction into memory, and takes it into account with the basic fuel injection duration to create a new reference fuel injection duration. Using the reference duration as the basic duration for the injection a few times later, the ECM can reduce the amount of correction and thus make its feedback control more accurate and responsive to changes in the air-fuel ratio due to difference in driving condition and sensor/actuator characteristics that may result from unit-to-unit variation or aging over time.

D: IGNITION CONTROL

- The ECM determines operating condition of the engine based on signals from the manifold absolute pressure sensor, engine coolant temperature sensor, intake air temperature sensor, crankshaft position sensor and other sources. The ECM then selects the ignition timing most appropriate for the condition thus determined from those stored in its memory and outputs at that timing a primary current OFF signal to the igniter to initiate ignition.
- This control uses a quick-to-response learning feature by which the data stored in the ECM memory is processed in comparison with information from various sensors and switches.
- Thus, the ECM can always perform optimum ignition timing taking into account the output, fuel efficiency, exhaust gas, and other factors for every engine operating condition.
- Ignition control during start-up
 Engine speed fluctuates during start of the engine, so the ECM cannot control the ignition timing. During that period, the ignition timing is fixed at 10° BTDC by using the 10° signal from the crankshaft position sensor.

FU-02412

CONTROL SYSTEM

FUEL INJECTION (FUEL SYSTEM)

● Ignition control after start of engine

From the time to receive crank angle signals indicating 180° of a turn, the ECM measures the engine speed, and by using this data it decides the dwell set timing and ignition timing according to the engine condition.

FU-02019

F: FUEL PUMP CONTROL

Using the signal from the crankshaft position sensor, the ECM controls operation of the fuel pump by turning its relay ON or OFF. To improve safety, the fuel pump is stopped if the engine stalls with the ignition switch ON.

Ignition switch ON	Fuel pump relay	Fuel pump
A certain period of time after ignition switch is turned ON	ON	Operates
While cranking the engine	ON	Operates
While engine is operating	ON	Operates
When engine stops	OFF	Does not operate

ON-BOARD DIAGNOSIS SYSTEM

FUEL INJECTION (FUEL SYSTEM)

6. On-board Diagnosis System

A: GENERAL

- The on-board diagnosis system detects and indicates a fault by generating a code corresponding to each fault location. The malfunction indicator light on the combination meter indicates occurrence of a fault or abnormality.
- When the malfunction indicator light comes on as a result of detection of a fault by the ECM, the corresponding diagnostic trouble code (DTC) and freeze frame engine condition are stored in the ECM.
- On the OBD-II conformable car, it is necessary to connect the SUBARU Select Monitor (SSM) or General Scan Tool (GST) to the data link connector in order to check the DTC.
- The SSM and GST can be used for erasing DTCs. These can also read freeze frame data in addition to other pieces of engine data.
- If there is a failure involving sensors, which may affect drive control of the vehicle, the fail-safe function ensures minimum level of drivability.

B: FAIL-SAFE FUNCTION

For a sensor or switch that has been judged to be faulty by the on-board diagnosis, the ECM generates a pseudo signal to keep the vehicle operational. (The control becomes degraded.)

SYSTEM OVERVIEW

EMISSION CONTROL (AUX. EMISSION CONTROL DEVICES)

1. System Overview

There are three emission control systems, which are as follows:

- Crankcase emission control system
- Exhaust emission control system
 - Catalytic converter
 - Air/fuel (A/F) control system
 - Ignition control system
 - Exhaust gas recirculation system
- Evaporative emission control system
 - On-board refueling vapor recovery (ORVR) system

SYSTEM OVERVIEW

EMISSION CONTROL (AUX. EMISSION CONTROL DEVICES)

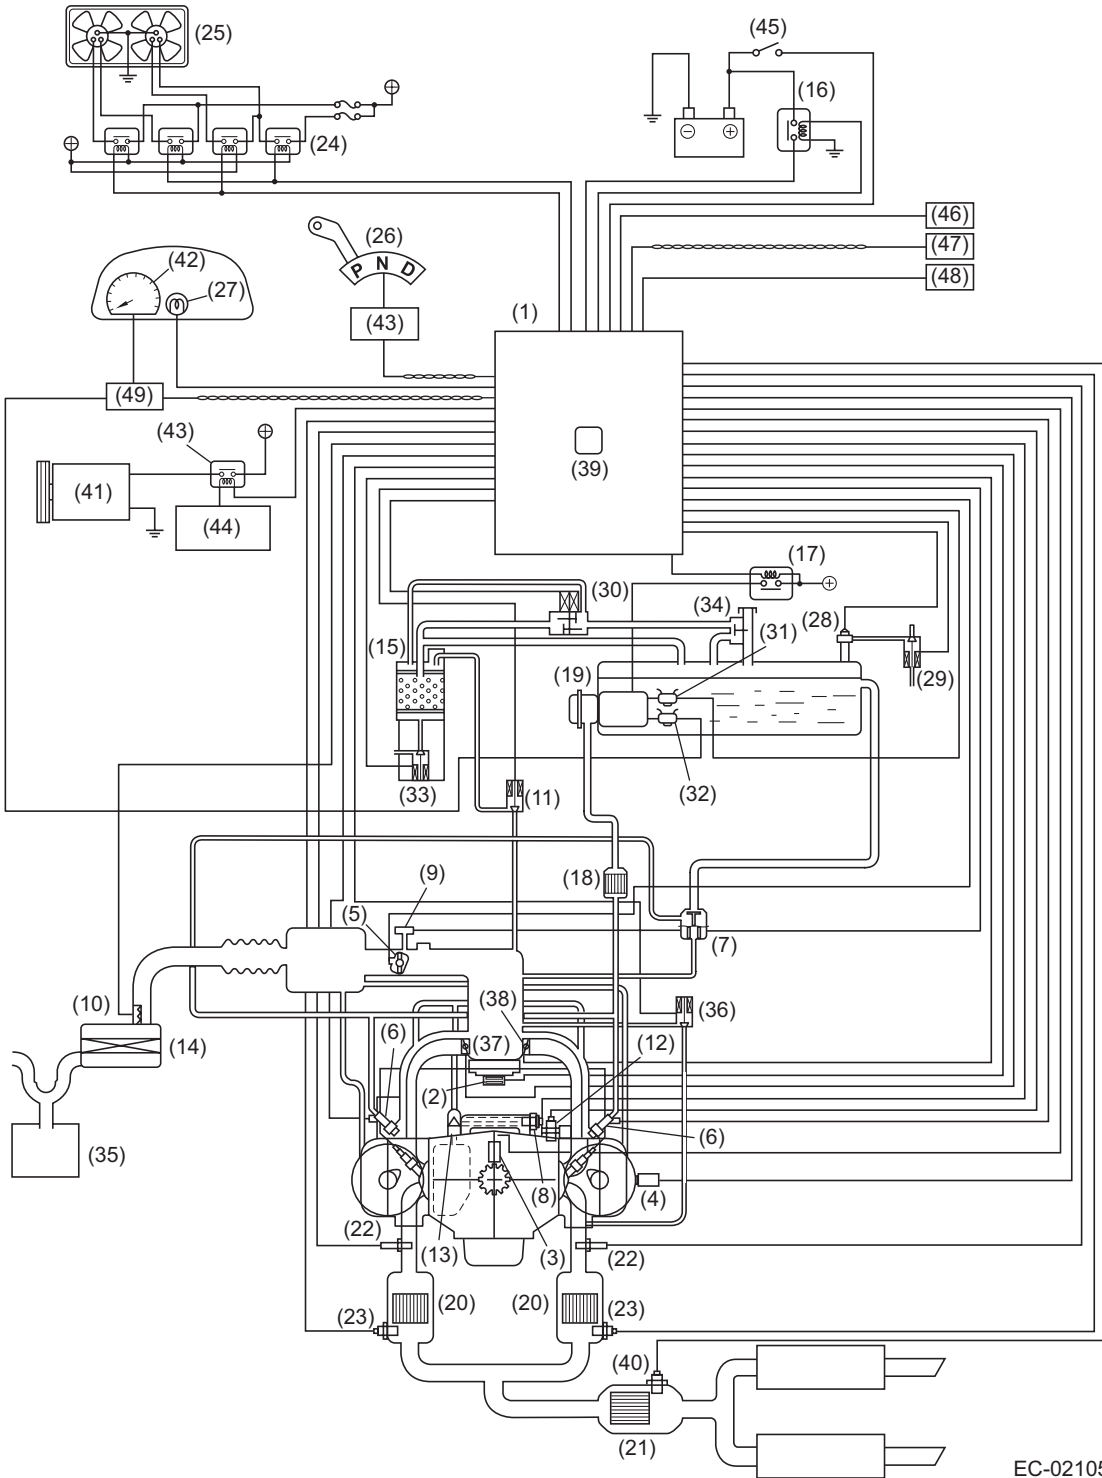

Item		Main components	Function	
Crankcase emission control system		Positive crankcase ventilation (PCV) valve	Draws blow-by gas into intake manifold from crankcase and burn it together with air-fuel mixture. Amount of blow-by gas to be drawn in is controlled by intake manifold pressure.	
Exhaust emission control system	Catalytic converter	Front	Catalytic converter	Oxidizes HC and CO contained in exhaust gases as well as reducing NOx.
		Rear		
	Air/fuel (A/F) control system	Engine control module (ECM)	Receives input signals from various sensors, compares signals with stored data, and emits a signal for optimal control of air-fuel mixture ratio.	
		Front oxygen (A/F) sensor	Detects density of oxygen contained exhaust gases.	
		Front oxygen sensor Rear oxygen sensor	Detects density of oxygen contained in exhaust gases.	
		Throttle position sensor	Detects throttle opening.	
		Manifold absolute pressure sensor	Detects absolute pressure of intake manifold.	
		Mass air flow and intake air temperature sensor	Detects amount of intake air. Detects intake air temperature at air cleaner case.	
	Ignition control system	ECM	Receives various signals, compares signals with basic data stored in memory, and emits a signal for optimal control of ignition timing.	
		Crankshaft position sensor	Detects engine speed (revolution).	
		Camshaft position sensor	Detects reference signal for combustion cylinder discrimination.	
		Engine coolant temperature sensor	Detects coolant temperature.	
	Exhaust gas recirculation system	Knock sensor	Detects engine knocking.	
		EGR valve	Adjusts the amount of exhaust gas flowing back to the intake pipe.	
Evaporative emission control system	Canister	Absorbs evaporative gas that accumulates in fuel tank when engine stops, and releases it to combustion chambers for a complete burn when the engine is started. This prevents HC from being discharged into atmosphere.		
	Purge control solenoid valve	Receives a signal from ECM and controls purge of evaporative gas absorbed by canister.		
	Pressure control solenoid valve	Receives a signal from ECM and controls evaporative gas pressure in fuel tank.		
ORVR system	Vent valve	Controls evaporation pressure in the fuel tank.		
	Drain valve	Closes the evaporation line by receiving a signal from ECM to check the evaporation gas leak.

CRANKCASE EMISSION CONTROL SYSTEM

EMISSION CONTROL (AUX. EMISSION CONTROL DEVICES)

3. Crankcase Emission Control System

- The positive crankcase ventilation (PCV) system prevents air pollution that will be caused by blow-by gas being emitted from the crankcase. The system consists of a sealed oil filler cap, rocker covers with fresh air inlet, connecting hoses, a PCV valve and an air intake duct.
- In a part-throttle condition, the blow-by gas in the crankcase flows into the intake manifold through the connecting hose of crankcase and PCV valve by the strong vacuum created in the intake manifold. Under this condition, fresh air is introduced into the crankcase through the connecting hose of the rocker cover.
- In a wide-open-throttle condition, a part of blow-by gas flows into the air intake duct through the connecting hose and is drawn into the throttle chamber, because under this is condition, the intake manifold vacuum is not strong enough to introduce through the PCV valve all blow-by gases that increase in the amount with engine speed.

| (3) Throttle body | (8) Valve | (C) Blow-by gas |
| (4) Intake manifold | (9) Spring | |
| (5) Oil filler cap | (10) PCV valve | |

4. Catalytic Converter

- The basic materials of the three-way catalytic converter are platinum (Pt), rhodium (Rh) and palladium (Pd), and a thin coat of their mixture is applied onto a honeycomb or porous ceramic (carrier). To avoid damaging the catalytic converter, only unleaded gasoline should be used.
- The catalytic converter reduces HC, CO and NO_x in exhaust gases through chemical reactions (oxidation and reduction). These harmful components are reduced most efficiently when their concentrations are in a certain balance. These concentrations vary with the air-fuel ratio. The ideal air-fuel ratio for reduction of these components is the stoichiometric ratio.
- Therefore, the air-fuel ratio needs to be controlled to around the stoichiometric ratio to purify the exhaust gases most efficiently.

AIR/FUEL (A/F) CONTROL SYSTEM

EMISSION CONTROL (AUX. EMISSION CONTROL DEVICES)

5. Air/fuel (A/F) Control System

- The air/fuel (A/F) control system makes a correction to the basic fuel injection duration in accordance with the signals from the front oxygen (A/F) sensor and the rear oxygen sensor so that the stoichiometric ratio is maintained, thus ensuring most effective exhaust gas purification by the three-way catalytic converter. Different basic fuel injection durations are preset for various engine speeds and loads, as well as the amount of intake air.
- This system also has a learning control function which stores the corrected data in relation to the basic fuel injection in the memory map. This allows an appropriate air-fuel ratio correction to be added automatically in quick response to any situation that requires such an effect. Thus, the air-fuel ratio is optimally maintained under various conditions while purifying exhaust gases most effectively, improving driving performance and compensating for changes in sensors' performance over time.

AIR/FUEL (A/F) CONTROL SYSTEM

EMISSION CONTROL (AUX. EMISSION CONTROL DEVICES)

MEMO

IGNITION CONTROL SYSTEM

EMISSION CONTROL (AUX. EMISSION CONTROL DEVICES)

6. Ignition Control System

- The ignition system is controlled by the ECM. The ECM monitors the operating condition of the engine using the signals from the sensors and switches shown below and determines the ignition timing most appropriate for each engine operating condition. Then it sends a signal to the igniter, commanding generation of a spark at that timing.
- The ECM uses a preprogrammed map for a “closed-loop” control which provides its ignition timing control with excellent transient characteristics, i.e., highly responsive ignition timing control.

EXHAUST GAS RECIRCULATION (EGR) SYSTEM

EMISSION CONTROL (AUX. EMISSION CONTROL DEVICES)

7. Exhaust Gas Recirculation (EGR) System

1. GENERAL

- The EGR system aims at reduction of NO_x by lowering the combustion temperature through re-circulation of a part of exhaust gas into cylinders via the intake manifold.
- The EGR valve is controlled by the ECM according to the engine operating condition.

- (1) EGR valve
- (2) ECM
- (3) Intake manifold

- (4) Exhaust port
- (5) Cylinder head LH

EVAPORATIVE EMISSION CONTROL SYSTEM

EMISSION CONTROL (AUX. EMISSION CONTROL DEVICES)

8. Evaporative Emission Control System

A: GENERAL

- The evaporative emission control system prevents fuel vapors from escaping into atmosphere. This system includes a canister, purge control solenoid valve, fuel cut valve, and the lines connecting them.
- Fuel vapor in the fuel tank is introduced into the canister through the evaporation line, and are absorbed by activated carbon in it. The fuel cut valve is also incorporated in the fuel tank line.
- The purge control solenoid valve is controlled optimally by the ECM according to the engine condition.
- The pressure control solenoid valve incorporated in the fuel tank evaporation line regulates the pressure/vacuum in the fuel tank under the control of the ECM which uses the signal from the fuel tank pressure sensor.

- | | | |
|----------------------------------|-------------------------------------|-------------------------------------|
| (1) Fuel gauge | (7) Pressure control solenoid valve | (13) Fuel tank |

| (5) Engine control module (ECM) | (11) Fuel temperature sensor | (17) Fuel tank sensor control valve |
| (6) Canister | (12) Fuel level sensor | |

B: FUEL CUT VALVE

The fuel cut valve is incorporated in the fuel tank. The rising level of the fuel in the fuel tank causes the float to move up and close the cap hole so that no fuel can flow to the evaporation line.

EVAPORATIVE EMISSION CONTROL SYSTEM

EMISSION CONTROL (AUX. EMISSION CONTROL DEVICES)

C: FUEL TANK CAP

- The fuel tank cap is of a quick lock type and can be opened or closed in 1/4 of a full turn.
- The fuel tank cap has a relief valve, which prevents development of vacuum in the fuel tank in the event of a problem with the fuel vapor line.

When there is no problem with the fuel vapor line, the filler pipe is sealed at the portion (A) and by the seal pressed against the filler pipe end. If vacuum develops in the fuel tank, the atmospheric pressure forces the spring down to open the valve; consequently outside air flows into the fuel tank, thus controlling the inside pressure.

EC-02109

- (1) Seal
- (2) Spring
- (3) Valve
- (4) Filter

EVAPORATIVE EMISSION CONTROL SYSTEM

EMISSION CONTROL (AUX. EMISSION CONTROL DEVICES)

D: CANISTER

The canister incorporates a drain valve and a drain filter.

The charcoal filled in the canister temporarily stores fuel vapors. When the purge control solenoid valve is opened by a signal from the ECM, the external fresh air entering the canister carries the fuel vapors into the collector chamber.

The drain filter is installed at the air inlet port of the drain valve. It cleans the air taken in the canister through the drain valve.

The drain valve is located just below the drain filter.

EVAPORATIVE EMISSION CONTROL SYSTEM

EMISSION CONTROL (AUX. EMISSION CONTROL DEVICES)

F: PRESSURE CONTROL SOLENOID VALVE

The fuel tank pressure control solenoid valve is located in the evaporation line between the canister and the fuel tank.

When the tank inside pressure becomes higher than the atmospheric pressure, the valve is opened allowing fuel vapors to be introduced into the canister.

On the other hand, when the tank inside pressure becomes lower than the atmospheric pressure, external air is taken from the drain valve into the canister.

EC-00026

| (5) Valve | |

G: VENT VALVE

The vent valve is incorporated in the fuel tank. During filling the fuel tank, fuel vapors are introduced into the canister through the vent valve.

When the fuel vapor pressure becomes higher than the atmospheric pressure and overcomes the spring force which is applied to the back side of the diaphragm, the port toward the canister is opened. The vent valve also has a float which rises and block the port toward the canister when the fuel is full.

EVAPORATIVE EMISSION CONTROL SYSTEM

EMISSION CONTROL (AUX. EMISSION CONTROL DEVICES)

ON-BOARD REFUELING VAPOR RECOVERY (ORVR) SYSTEM

EMISSION CONTROL (AUX. EMISSION CONTROL DEVICES)

9. On-board Refueling Vapor Recovery (ORVR) System

A: GENERAL

The on-board refueling vapor recovery system allows the fuel vapors in the fuel tank to be introduced directly into the canister through the vent valve when the fuel tank inside pressure increases as a result of refueling.

The diagnosis of the system is performed by monitoring the fuel tank inside pressure data from the fuel tank pressure sensor while forcibly closing the drain valve.

B: OPERATION

- While driving

Since the back side of the diaphragm in the pressure control solenoid valve is open to the atmosphere, the diaphragm is held pressed by the atmospheric pressure in the position where only the external air is introduced into the canister. When the fuel vapor pressure acting on the other side of the diaphragm increases and overcomes the atmospheric pressure, it pushes the diaphragm and opens the port through which the fuel vapors make their way to the canister.

EC-02094

|-------------------------------------|--------------------------|
| (1) Canister | (4) Intake manifold |
| (2) Pressure control solenoid valve | (5) Shut-off valve: open |
| (3) Purge control solenoid valve | |

ON-BOARD REFUELING VAPOR RECOVERY (ORVR) SYSTEM

EMISSION CONTROL (AUX. EMISSION CONTROL DEVICES)

- While refueling

As the fuel enters the fuel tank, the tank inside pressure increases. When the inside pressure becomes higher than the atmospheric pressure, the port of the vent valve opens, allowing the fuel vapors to be introduced into the canister through the vent line. The fuel vapors are absorbed by charcoal in the canister, so the air discharged from the drain valve contains no fuel. When a filler gun is inserted, the shut-off valve closes the evaporation line.

GENERAL

MECHANICAL

1. General

The engine used in this vehicle is of a horizontally opposed, four-cylinder design. This four-stroke-cycle, water-cooled, SOHC engine uses a total of 16 valves and its main components are made of aluminum alloy. It is fueled by a multiple fuel injection system.

The engine's major structural and functional features are as follows:

- The cylinder head forms pent roof combustion chambers, each having a spark plug located at its center and two each of intake and exhaust valves (four valves per cylinder). The intake and exhaust ports are located in a cross-flow arrangement.
- There are a screw and nut at the valve end of each rocker arm. They are used for adjusting the valve clearance.
- A single timing belt drives two camshafts on the left and right banks and the water pump on the left bank. A belt tension adjuster automatically adjusts the belt tension and eliminates the need for manual adjustments.
- The crankshaft is supported at five journals with high rigidity and strength.
- The cylinder block is made of aluminum die-casting, and cast iron cylinder liners are cast in.

| (3) Cylinder block | (8) Cylinder head | (13) Intake rocker shaft |
| (4) Connecting rod | (9) Oil pan | (14) Intake rocker arm |
| (5) Spark plug | (10) Exhaust valve | |

2. Timing Belt

- A single timing belt drives two camshafts (one in the left bank and one in the right bank). The belt also drives the water pump by its non-toothed side.
- The timing belt teeth have a specially designed round profile, which contributes to quiet operation. The timing belt is made of strong and inflexible core cords, wear-resistant canvas and heat-resistant rubber material.
- A hydraulic automatic belt tension adjuster always keeps the belt taut to the specified tension. Any manual belt tension adjustment is unnecessary.

ME-00431

** : The #1 piston is at TDC on the compression stroke when the piston position mark on the camshaft sprocket is aligned with the timing mark on the belt cover.

AUTOMATIC BELT TENSION ADJUSTER

MECHANICAL

3. Automatic Belt Tension Adjuster

The automatic belt tension adjuster consists of a tensioner unit and a bracket. It maintains the timing belt tension automatically at a specified level to enable the belt to transmit power correctly, reduce operating noise and increase the life of the belt.

The cylinder of the tensioner unit incorporates an adjuster rod, wear ring, plunger spring, return spring, check ball and silicone oil.

The automatic belt tension adjuster gives tension to the belt by a levering action which is produced by the push force of the tensioner unit's adjuster rod. It operates in the process detailed below.

ME-00314

- | | |
|---------------------------|--------------------------|
| (1) Oil seal | (8) Plunger spring |
| (2) Wear ring | (9) Check ball |
| (3) Oil reservoir chamber | (10) Timing belt |
| (4) Return spring | (11) Belt tension pulley |
| (5) Adjuster rod | (12) Tensioner bracket |
| (6) Plunger | (13) Cylinder |
| (7) Oil pressure chamber | |

AUTOMATIC BELT TENSION ADJUSTER

MECHANICAL

- Timing belt tensioning action

When the belt becomes slack, the adjuster rod is pushed upward by the return spring. The oil in the reservoir chamber, which is pressurized by the plunger spring to a certain level, pushes open the check ball and flows into the oil pressure chamber to keep the pressure constant. The thrust force F resulting from extension of the adjuster rod applies a counterclockwise torque to the tensioner bracket, which causes the belt tension pulley at its end to turn in the same direction. This applies tensioning pressure P_b to the timing belt.

- Timing belt tension balancing action

When the belt tension pulley is pushed against the timing belt with pressure P_b , reaction force T_b of the timing belt generates the reaction force P at the point on which the adjuster rod force is acting. This force P pushes the adjuster rod until it balances with the sum of the thrust force F and the pressure of the oil in the oil pressure chamber. Therefore, the timing belt tension is kept constant.

- Over-tension correction action

If the tension of the timing belt increases excessively, the force P becomes larger than the thrust force F and silicone oil is returned from the oil pressure chamber to the reservoir chamber little by little until the force P balances again with the thrust force F . Thus the timing belt tension is maintained at the specified level at all times.

BELT COVER

MECHANICAL

4. Belt Cover

- The belt cover is made of lightweight, heat resistant synthetic resin molding. It constitutes a totally enclosed housing with its cylinder block mating edges sealed with rubber gaskets. This effectively protects the inside components from dust and liquid.
- Rubber seals used between the cylinder block and the belt cover effectively reduces transmission of noise and vibration.
- The front belt cover has a line mark for ignition-timing checking.

ME-00315

- (1) Front belt cover
- (2) Belt cover No. 2 (RH)
- (3) Belt cover No. 2 (LH)
- (4) Belt cover (LH)

5. Valve Rocker Assembly

- The intake valve rocker arms and the exhaust valve rocker arms are installed on their own rocker shafts both of which are retained by the camshaft caps.
- The valve end of each rocker arm is provided with valve rocker adjusting screw and nut. Turning of this screw adjusts the valve clearance.
- The exhaust valve rocker arms are Y-shaped, and each arm operates two exhaust valves simultaneously.
- Each rocker shaft has an oil passage in it.

ME-00316

- | | |
|--|------------------------------|
| (1) Valve rocker adjusting screw and nut | (4) Camshaft cap |
| (2) Intake valve rocker arm | (5) Supporter |
| (3) Wave washer | (6) Exhaust valve rocker arm |

CAMSHAFT

MECHANICAL

6. Camshaft

- The camshaft is supported inside the cylinder head at four journals.
- The two flanges on each camshaft supports thrust forces to limit the end play of the camshaft within the tolerance.
- Each camshaft has an oil passage in it. The oil passage is formed by casting (hollowed in varying inner diameter) to reduce the weight.

ME-02102

- (1) Journal
- (2) Oil passage
- (3) Shaft flange
- (4) Hollowed in varying inner diameter

7. Cylinder Head

- The cylinder head is made of low pressure cast aluminum.
- Each combustion chamber in the cylinder head is a compact, pent roof design. The spark plug is located at the center of the combustion chamber, which contributes to creation of a wide “squish area” for increased combustion efficiency.
- The two intake and two exhaust valves are arranged on opposite sides for a cross-flow feature.
- As a design feature, the exhaust port of adjacent cylinders are joined to a single port, aiming at decreasing heat dissipation and accelerate activation of the catalytic converter.
- The cylinder head gasket is a metallic gasket. The gasket is highly resistant to heat and maintains high level of sealing performance for a long period.

ME-00318

- (1) Intake valve
- (2) Intake port
- (3) Squish area
- (4) Combustion chamber

- (5) Exhaust port
- (6) Exhaust valve
- (7) Spark plug

8. Cylinder Block

- The cylinder block is made of aluminum die casting. Its open-deck design provides it with such advantageous features as relatively small weight, high rigidity and excellent cooling efficiency.
- The cylinder liners are made of cast iron. As they are of a dry type, their outer surfaces are entirely in contact with the cylinder block.
- The cylinder block supports the crankshaft at its five journals. The journal supporting portions are designed such that sufficient stiffness and quiet operation are ensured.
- Sintered material is fit in the casting at the #5 journal to achieve further quietness.
- The oil pump is located in the front center of the cylinder block and the water pump is located at the front of the left-cylinder bank. At the rear of the right-cylinder bank is an oil separator which removes oil mist contained in blow-by gas.

9. Crankshaft

The crankshaft is supported in the cylinder block at five journals. Each corner formed by a journal or pin and a web is finished by fillet-rolling method which increases strength of that area. The five crankshaft bearings are made of aluminum alloy and the No. 5 bearing is provided with a flanged metal to support thrust forces.

ME-00319

PISTON

MECHANICAL

10.Piston

- The pistons are of a slipper skirt design for reduced weight and friction. The piston is also a thermal flow type whose oil control ring groove is provided with round oil drain holes.
- The piston pin is offset toward the thrust side (No. 1 and No. 3 pistons downwards, No. 2 and No. 4 pistons upwards) to reduce piston slap noises.
- The piston head has recesses to prevent interference with the intake and exhaust valves. It also has engraved marks to identify the piston size and the direction of installation. On type I models, the piston heads are concaved at the entire exhaust side to gather the tumble flow around the spark plug and improve combustion. Only on the type I models the pistons are distinguished left or right.
- Three piston rings are used for each piston; two compression rings and one oil control ring. The top piston ring has inner bevels and the second piston ring has an interrupt (cut) on the bottom outside to reduce oil consumption.

MEMO

EX(H4SO)-4

1. General

- The engine cooling system consists of a down-flow radiator featuring high heat-dissipation performance, an electric-motor-driven fan, a water pump, a thermostat, and an engine coolant temperature sensor.
- The reservoir tank is made of translucent resin and enables easy confirmation of the coolant level. Also, coolant should be added to the reservoir tank when replenishment is necessary.
- The ECM controls the operation of the radiator main fan and sub fan depending on the signals from the engine coolant temperature sensor, vehicle speed sensor and A/C switch.

2. Cooling Circuits

The cooling system operates in three different phases depending on the temperature of the engine coolant.

- 1st phase (thermostat closed)

When the engine coolant temperature is lower than the preset value, the thermostat remains closed. The coolant flows through the heater circuit. This permits the engine to warm up quickly.

- 2nd phase (thermostat open)

When the engine coolant temperature reaches the preset value, the thermostat opens. The coolant flows through the radiator where it is cooled.

- 3rd phase (thermostat open and radiator fan operating)

When the engine coolant temperature becomes higher than the preset value, the ECM receives a signal from the engine coolant temperature sensor and causes the radiator fan(s) to operate.

NOTE:

Refer to the Service Manual for preset engine coolant temperature values for each stage.

	Low	OFF	Low-Speed	High-Speed
	High	Low-Speed	High-Speed	High-Speed
When accelerating: over 106 km/h (66 MPH) When decelerating: over 104 km/h (64.6 MPH)	OFF	OFF	OFF	High-Speed
	Low	OFF	Low-Speed	High-Speed
	High	OFF	Low-Speed	High-Speed

RADIATOR CAP

COOLING

7. Radiator Cap

The radiator cap has a pressure valve and a vacuum valve. When the radiator inner pressure becomes higher than specified, the pressure valve opens to send coolant to the reservoir tank. Also, when the radiator inner pressure becomes lower than the atmospheric pressure during the cooling down phase, the vacuum valve opens to send back coolant from the reservoir tank to the radiator. These functions prevent damage to the radiator components.

- (1) Pressure valve
- (2) Vacuum valve

1. General

- The lubrication system forcibly circulates engine oil throughout the engine using an oil pump. The oil pressure is regulated by the relief valve built into the oil pump.
- The oil pump is a thin, large-diameter trochoid rotor type which can accommodate the engine's high output. The pump is directly driven by the crankshaft.
- The engine oil is cleaned by a full-flow, paper element type oil filter. The filter has a bypass valve, which allows the engine oil to flow bypassing the filter if it is clogged.
- The inside of the oil pan is fitted with a baffle plate, which reduces changes in the oil level due to movement of the vehicle, thus ensuring uninterrupted suction of oil.
- The engine oil discharged from the oil pump is delivered to the journal bearings, connecting rod bearings, and other parts requiring lubrication and cooling through the oil filter, vertical passage in the right bank of the cylinder block, and the oil galleries in the right and left banks of the cylinder block.
- The engine oil is also distributed to each cylinder head valve mechanism at a proper flow rate achieved by metering by the orifice provided in each oil gallery.

ENGINE OIL FLOW

LUBRICATION

2. Engine Oil Flow

LU-02109

3. Oil Pump

- The oil pump is a trochoid rotor type consisting of an inner rotor and outer rotor assembled with each other in a pump body. When the inner rotor is driven by the crankshaft, the outer rotor is rotated, changing the space between it and the inner rotor. The change in the space occurs because of the difference in the number of teeth between the rotors.
- Engine oil is carried from the inlet port to the discharge port. As the pump rotates, the space carrying the oil becomes smaller, thus the oil is pressurized and discharged from the discharge port. A relief valve is built in the oil pump at its discharge side. When the oil pressure becomes higher than the preset value, the relief valve regulates the pressure by sending excessive oil back to the inlet side.

| (5) Oil pump cover | |

OIL FILTER

4. Oil Filter

The oil filter is a full-flow filtering, cartridge type that utilizes a paper element. It also has a built-in bypass valve. If the filter gets clogged causing the oil pressure to exceed the preset value, the bypass valve opens and detours the engine oil to flow around the filter. The filter element has a special pleat design to increase the effective filtering area.

- (2) Filter body
- (3) Bypass valve
- (4) Pleated element

5. Oil Pan and Oil Strainer

- The oil pan is attached to the cylinder block using liquid gasket for sealing. The oil strainer is a metal net type and removes large foreign particles from the engine oil. It is located in the middle of the oil pan. The pipe from the strainer is connected to the suction port of the oil pump in the left bank of the cylinder block.
- There is a baffle plate inside the oil pan. It stabilizes the oil level and reinforces the oil pan.

OIL PRESSURE SWITCH

LUBRICATION

6. Oil Pressure Switch

The oil pressure switch is located in the front upper portion of the right cylinder block bank. The purpose of this switch is to monitor the operation of the oil pump as well as the lubricating oil pressure when the engine is running.

LU-00061

- | | |
|---------------|--------------------|
| (1) Contact | (4) Molded portion |
| (2) Diaphragm | (5) Terminal |
| (3) Spring | |

1) When oil pressure does not build up (immediately after ignition switch is turned ON):
The diaphragm is pushed toward the cylinder block by the spring force (a force equivalent to the specified oil pressure). This closes the contact points, causing the oil pressure warning light in the combination meter to illuminate.

2) When oil pressure reaches the specified value (after engine starts):
After reaching the specified value, the oil pressure pushes the diaphragm against the spring force. This opens the contact points and the oil pressure warning light goes out.

GENERAL

SPEED CONTROL SYSTEM

1. General

An electronically controlled throttle is adopted.

The movement of the accelerator pedal is converted into electrical signals by the accelerator pedal position sensor and these signals are sent to the ECM.

The ECM controls the operation of the throttle body based on the signals from the accelerator pedal position sensor and on other driving conditions.

SP-02029

(1) Accelerator pedal position sensor

IGNITION COIL

IGNITION

1. Ignition Coil

Ignition coils are made integral with an igniter. The ignition system is of a dual-ignition-coil design, each coil causing two plugs to generate sparks simultaneously. In response to the signal from the ECM, the igniter supplies current to an ignition coil and the ignition coil supplies high-voltage current to a pair of spark plugs (#1 and #2 or #3 and #4) simultaneously.

2. Generator

The generator has a built-in regulator which provides diagnostic functions in addition to a voltage regulating function as follows:

1) Voltage regulation

The on-off operation of transistor connects and disconnects the field current circuit, providing a constant level of output voltage.

2) Diagnosis warning

When any of the following problems occur, the charge light illuminates.

(1) No voltage generation

Brush wear exceeds specified wear limits, field coil circuit is broken, etc.

(2) Excessive output

Output voltage is greater than 16 volts (approx.)

(3) Terminal B disconnection

Harness is disconnected from generator terminal B.

(4) Terminal S disconnection

Harness is disconnected from generator terminal S. In this case, voltage is slightly greater than specified regulated voltage; however, voltage regulation is still controlled and the battery is prevented from becoming overcharged.

GENERAL

FUEL INJECTION (FUEL SYSTEM)

1. General

- The Multipoint Fuel Injection (MFI) system supplies optimum air-fuel mixture under every engine operating condition through the use of the latest electronic control technology.

This system pressurizes the fuel to a constant pressure and injects it into each intake air port in the cylinder head. The injection quantity of fuel is controlled by an intermittent injection system where an electro-magnetic injection valve or injector opens for a short period that is precisely controlled depending on the quantity of air appropriate for each condition of operation. In actual control, an optimum fuel injection quantity is achieved by varying the duration of an electric pulse applied to the injector. This way of control enables simple, yet highly precise metering of the fuel.

- The engine control module (ECM) that controls the fuel injection system corrects the fuel injection amount depending on the vehicle speed, throttle opening, coolant temperature and other vehicle-operation-related information. The ECM receives the information in the form of electric signals from the corresponding sensors and switches.

The MFI system also has the following features:

- Reduced exhaust emissions
- Reduced fuel consumption
- Increased engine output
- Quick response to accelerator and brake pedal operation
- Superior startability and warm-up performance in cold weather due to corrective controls made according to coolant and intake air temperatures

2. Air Line

A: GENERAL

The air filtered by the air cleaner enters the throttle body where it is regulated in the volume by the throttle valve and then enters the intake manifold. It is then distributed to each cylinder where the air is mixed with fuel injected by the injector.

B: MANIFOLD ABSOLUTE PRESSURE SENSOR

The manifold absolute pressure sensor is attached to the intake manifold, and continuously sends to the engine control module (ECM) voltage signals that are proportional to intake manifold absolute pressures. The ECM controls the fuel injection and ignition timing based on the intake manifold absolute pressure signals in addition to other signals from many sensors and other control modules.

FU-01239

(1) Manifold absolute pressure sensor

(A) Output voltage

(B) Absolute pressure

AIR LINE

FUEL INJECTION (FUEL SYSTEM)

C: ELECTRONIC CONTROL THROTTLE SYSTEM

- The electronic control throttle system consists of an accelerator pedal position sensor mounted on the accelerator pedal, a throttle position sensor and a throttle motor mounted on the throttle body, and the ECM which controls these devices.
- The movement of the accelerator pedal is converted into electrical signals by the accelerator pedal position sensor and sent to the ECM. Based on these signals the ECM controls the throttle motor to open and close the throttle valve.
- Idling control is now performed by the electronic control throttle system in place of the idle air control solenoid valve.

- | | |
|--|---------------------------------------|
| (1) Throttle position sensor | (4) Electronic control throttle relay |
| (2) Accelerator pedal position sensor | (5) ECM |
| (3) Electronic control throttle assembly | |

D: MASS AIR FLOW AND INTAKE AIR TEMPERATURE SENSOR

The mass air flow and the intake air temperature sensors are integrated into a single unit. The unit is mounted on the air cleaner case and measures the amount as well as the temperature of the intake air.

The measured amount and temperature are converted into electrical signals and sent to the ECM. The ECM uses these signals to control injection and ignition timing as well as the fuel injection amount.

- (1) Mass air flow sensor
- (2) Intake air temperature sensor

(A) Air

AIR LINE

FUEL INJECTION (FUEL SYSTEM)

E: TUMBLE GENERATOR VALVE

- A tumble generator valve is provided on each engine bank, between the intake manifold and intake air ports. The right bank tumble generator valve has butterfly valves for the #1 and #3 cylinders and the left bank tumble generator valve has those for the #2 and #4 cylinders. The two butterfly valves in each tumble generator valve are fitted on a single shaft that is driven by an actuator.
- The tumble generator valves are controlled by the ECM according to the coolant temperature and the time elapsed after start of the engine. When the engine is started, the butterfly valves are moved to the closing ends. In this state, the intake air flows at very high speeds passing through narrowed passages in the directions determined by the individual intake air ports in the cylinder head. This creates tumbling air motions in the cylinders, which enables lean mixtures to be ignited and thus harmful exhaust emissions to be reduced during engine start. The tumble generator valves are fully open when the engine is operating at an ordinary driving speed, allowing intake air to flow without being changed in direction and velocity.

(7) Injector

(8) Cylinder head

3. Fuel System

A: GENERAL

- The fuel pressurized by the fuel tank inside pump is delivered to each fuel injector by way of the fuel pipe and fuel filter. Fuel injection pressure is regulated to an optimum level by the pressure regulator.
- Each injector injects fuel into the intake port of the corresponding cylinder where the fuel is mixed with air. The mixture then enters the cylinder. Fuel injection amount and timing are regulated by the ECM.
- On some models, the fuel bypass return passage connected between the fuel pump and engine prevents excessive fuel to be supplied to the engine and lowers the fuel temperature after return, to reduce the generation of evaporative gas.

FU-02027

- | | |
|----------------------|----------------------------|
| (1) #1 fuel injector | (6) Pressure regulator |
| (2) #2 fuel injector | (7) Fuel pump |

| (4) #4 fuel injector | (9) ECM |
| (5) Orifice | (10) Fuel return passage |

FUEL SYSTEM

FUEL INJECTION (FUEL SYSTEM)

B: PRESSURE REGULATOR

The pressure regulator is installed in the fuel supply line. It has a fuel chamber and spring chamber separated by a diaphragm. The fuel chamber is connected to the fuel supply line and the spring chamber is connected to the intake manifold. Fuel chamber also has a relief valve connected to the fuel return line through which fuel returns to the fuel tank. When the intake manifold vacuum increases, the diaphragm is pulled and the relief valve opens to decrease the fuel supply line pressure (or fuel injection pressure). When the intake manifold vacuum decreases, the diaphragm is pushed by the spring to increase the fuel supply line pressure. Thus, the difference between the fuel injection pressure and the intake manifold vacuum is kept at a constant level to precisely control the amount of injected fuel.

FU-02028

- (1) Pressure regulator
- (A) To intake manifold
- (B) Fuel IN
- (C) Fuel OUT

C: FUEL INJECTOR

- The MFI system employs side feed type fuel injectors.
- Each injector is installed in the fuel pipe in such a way that the injector is cooled by fuel.
- The features of this type of fuel injector are as follows:
 - 1) High heat resistance
 - 2) Low driving noise
 - 3) Easy to service
 - 4) Small size
- The injector injects fuel according to the valve open signal from the ECM. The needle valve is lifted by the solenoid which is energized on arrival of the valve open signal.
- Since the injector's nozzle hole area, the lift of valve and the fuel pressure are kept constant, the amount of fuel injected is controlled only by varying the duration of the valve open signal from the ECM.
- The multi-hole nozzle makes it possible for the injector to produce fine fuel particles, which enhances the combustion efficiency and output performance of the engine.

FUEL SYSTEM

FUEL INJECTION (FUEL SYSTEM)

D: FUEL TANK

The fuel tank utilizes a two-compartment design to ensure sufficient capacity without interfering with the rear differential. It is provided with a suction jet pump (included in the fuel pump and fuel level sensor assembly) which transfers fuel from one compartment to the other.

Each compartment has an individual fuel level sensor. The fuel tank is located under the rear seat and secured with hold-down bands.

- (1) Fuel pump and fuel level sensor assembly
- (2) Fuel sub level sensor
- (3) Band

- (4) Cushion
- (5) Steel

E: FUEL PUMP AND FUEL LEVEL SENSOR ASSEMBLY

1. FUEL PUMP

The fuel pump consists of a motor, impeller, pump casing, pump cover, check valve and filter. It is located in the fuel tank and combined with the fuel level sensor into a single unit. The operation of this impeller type pump is very quiet.

- When the ignition switch is turned ON, fuel pump relay is activated. Then the motor operates to rotate the impeller.
- As the impeller rotates, fuel in a vane groove of the impeller flows along the fuel passage into the next vane groove by centrifugal force. When fuel flows from one groove to the next, a pressure difference occurs due to friction. This creates a pumping effect.
- The fuel pushed up by rotation of the impeller then passes through the clearance between the armature and the magnet of the motor and is discharged through the check valve.
- When the fuel discharge pressure reaches the specified level, the relief valve opens and excess fuel is released into the fuel tank. In this manner, the relief valve prevents an abnormal increase in fuel pressure.
- When the engine and the fuel pump stop, the check valve closes the discharge port, so that the fuel pressure in the fuel delivery line is retained.

2. FUEL LEVEL SENSOR

The fuel level sensor is integrated with the fuel pump which is located in the fuel tank. The sensor outputs an electric resistance signal that varies with movement of its float to indicate the level of the fuel remaining in the tank.

FU-02519

- (1) Fuel pump assembly
- (2) Fuel level sensor
- (3) Float
- (4) Fuel temperature sensor

FUEL SYSTEM

FUEL INJECTION (FUEL SYSTEM)

3. JET PUMP

- The jet pump utilizes the velocity of fuel returning from the engine to produce vacuum in it.
- Using the pumping effect produced by the vacuum, the jet pump transfers fuel from the sub side and main side of the fuel tank to the fuel pump.
- When the return line nozzle is clogged, the fuel sent back through the return line flows back into the fuel tank via the relief valve.

FU-00226

- (1) Relief valve
- (2) Nozzle

(A) Return line

4. FUEL FILTER

The fuel filter is integrated with the fuel pump assembly which is located in the fuel tank.

F: SUB-COMPARTMENT FUEL LEVEL SENSOR

This sensor detects the level of the fuel in the sub side (the side in which the fuel pump is not located) of the fuel tank. Also, when the jet pump is operating, fuel in the sub side is drawn up and transferred to the fuel pump.

- (1) Fuel level sensor
- (2) Float

(A) To jet pump

SENSORS AND SWITCHES

FUEL INJECTION (FUEL SYSTEM)

4. Sensors and Switches

A: FRONT OXYGEN (A/F) SENSOR

- The front oxygen sensor uses zirconium oxide (ZrO_2) which is a solid electrolyte, at portions exposed to exhaust gas.
- The zirconium oxide has the property of generating electromotive force when its both sides are exposed to oxygen ions of different concentration and the magnitude of this electromotive force depends on how much the difference is.
The front oxygen (A/F) sensor detects the amount of oxygen in exhaust gases by making use of this property of the zirconium oxide material.
- The zirconium oxide material is formed into a closed end tube and its external surface is exposed to exhaust gases with smaller oxygen ion concentration, whereas its internal surface is exposed to atmospheric air. The external surface has a porous platinum coating. The sensor housing is grounded to the exhaust pipe and the inside is connected to the ECM through the harness to be able to use the current output from the sensor.
- The sensor incorporates a ceramic heater to improve its performance at low temperatures.

FU-02163

- (4) Ceramic heater

SENSORS AND SWITCHES

FUEL INJECTION (FUEL SYSTEM)

- When rich air-fuel mixture is burnt in the cylinder, the oxygen in the exhaust gases is almost completely used in the catalytic reaction by the platinum coating on the external surface of the zirconia tube. This results in a very large difference in the oxygen ion concentration between the inside and outside of the tube, and the electromotive force generated is large.
- When a lean air-fuel mixture is burnt in the cylinder, relatively large amount of oxygen remains in the exhaust gases even after the catalytic action, and this results in a small difference in the oxygen ion concentration between the tube's internal and external surfaces. The electromotive force in this case is very small.
- The difference in oxygen concentration changes drastically in the vicinity of the stoichiometric air-fuel ratio, and hence the change in the electromotive force is also large. By using this information, the ECM can determine the air-fuel ratio of the supplied mixture easily. The front oxygen (A/F) sensor does not generate much electromotive force when the temperature is low. The output characteristics of the sensor stabilize at a temperature of approximately 700°C (1,292°F).

FU-02015

- (A) Current
- (B) Air/fuel ratio
- (C) Rich
- (D) Lean

SENSORS AND SWITCHES

FUEL INJECTION (FUEL SYSTEM)

B: REAR OXYGEN SENSOR

- The rear oxygen sensor is used to sense oxygen concentration in the exhaust gas. If the air-fuel ratio is leaner than the stoichiometric ratio in the mixture (i.e., excessive amount of air), the exhaust gas contains more oxygen. To the contrary, if the fuel ratio is richer than the stoichiometric ratio, the exhaust gas contains almost no oxygen.
- By detecting the oxygen concentration in the exhaust gas using the oxygen sensor makes it possible to determine whether the air-fuel ratio is leaner or richer than the stoichiometric ratio.
- The rear oxygen sensor has a zirconia tube (ceramic) which generates voltage if there is a difference in oxygen ion concentration between the inside and outside of the tube. Platinum is coated on the inside and outside of the zirconia tube as a catalysis and electrode material. The sensor housing is grounded to the exhaust pipe and the inside is connected to the ECM through the harness.
- A ceramic heater is employed to improve performance at low temperatures.

SENSORS AND SWITCHES

FUEL INJECTION (FUEL SYSTEM)

C: ENGINE COOLANT TEMPERATURE SENSOR

The engine coolant temperature sensor is located on the engine coolant pipe. The sensor uses a thermistor whose resistance changes inversely with temperature. Resistance signals as engine coolant temperature information are transmitted to the ECM to make fuel injection, ignition timing, purge control solenoid valve and other controls.

FU-02017

- (1) Connector
- (2) Thermistor element

- (A) Resistance (kΩ)
- (B) Temperature °C (°F)

D: EXHAUST GAS TEMPERATURE SENSOR

The exhaust gas temperature sensor is located on the joint pipe and used to monitor the condition of the pre-catalytic converter.

E: CRANKSHAFT POSITION SENSOR

- The crankshaft position sensor is installed on the oil pump which is located in the front center portion of the cylinder block. The sensor generates a pulse when one of the teeth on the perimeter of the crankshaft sprocket (rotating together with the crankshaft) passes in front of it. The ECM determines the crankshaft angular position by counting the number of pulses.
- The crankshaft position sensor is a magnet pickup type and is molded with components such as a magnet, core, coil, and terminal, etc.

FU-00234

- (1) Terminal
- (2) Yoke core
- (3) Magnet

- (4) Coil
- (5) Core
- (6) Cover

SENSORS AND SWITCHES

FUEL INJECTION (FUEL SYSTEM)

- As the crankshaft rotates, each tooth aligns with the crankshaft position sensor. At that time, the magnetic flux in the sensor's coil changes since the air gap between the sensor pickup and the sprocket changes. This change in magnetic flux induces a voltage pulse in the sensor and the pulse is transmitted to the ECM.

- (2) Camshaft
- (3) Detection point
- (4) Camshaft one rotation (crankshaft two rotations)

G: KNOCK SENSOR

- The knock sensor is installed on the cylinder block, and senses knocking that occurs in the engine.
- The sensor is a piezo-electric type which converts vibration resulting from knocking into electric signals.
- In addition to a piezo-electric element, the sensor has a weight and case as its components. If knocking occurs in the engine, the weight in the case moves causing the piezo-electric element to generate a voltage.
- The knock sensor harness is connected to the engine harness.

- (1) Nut
- (2) Weight
- (3) Piezo-electric element
- (4) Housing
- (5) Resistance

H: VEHICLE SPEED SENSOR

Vehicle speed signals are sent from the vehicle speed sensor to the ABS and VDC control modules. The signals are sent to the ECM via CAN communication. For details, refer to the LAN section. <Ref. to LAN section.>

5. Control System

A: GENERAL

The ECM receives signals from various sensors, switches, and other control modules. Using these signals, it determines the engine operating conditions and if necessary, emits signals to one or more systems to control them for optimum operation.

Major control items of the ECM are as follow:

- Fuel injection control
- Ignition control
- Idle air control
- Fuel pump control
- Canister purge control*¹
- Radiator fan control*²
- On-board diagnosis function

*1: Canister purge control is described under EC(H4DOTC) — Emission Control (Aux. Emission Control Devices) Evaporative Emission Control System. <Ref. to EC(H4DOTC) section, Evaporative Emission Control System.>

*2: Radiator fan control is described under CO(H4DOTC) — COOLING. <Ref. to CO(H4DOTC) section.>

CONTROL SYSTEM

FUEL INJECTION (FUEL SYSTEM)

B: INPUT AND OUTPUT SIGNALS

Signal	Unit	Function
Input signals	Manifold absolute pressure sensor	Detects the pressure (measures the absolute pressure) of intake air .
	Mass air flow and intake air temperature sensor	Detects the temperature and amount of intake air.
	Throttle position sensor	Detects the throttle valve position.
	Front oxygen (A/F) sensor	Detects the density of oxygen in exhaust gases at the upstream of the front catalytic converter.
	Rear oxygen sensor	Detects the density of oxygen in exhaust gases at the downstream of the front catalytic converter.
	Crankshaft position sensor	Detects the crankshaft angular position.
	Camshaft position sensor	Detects the combustion cylinder.
	Engine coolant temperature sensor	Detects the engine coolant temperature.
	Knock sensor	Detects engine knocking.
	Accelerator position sensor	Detects the position of the accelerator pedal.
	Exhaust gas temperature sensor	Detects the exhaust gas temperature.
	Fuel temperature sensor	Detects the temperature of the fuel in the fuel tank.
	Fuel tank pressure sensor	Detects the evaporation gas pressure in the fuel tank.
	Ignition switch	Detects operation of the ignition switch.
	Starter switch	Detects the condition of engine cranking.
	Neutral position switch (MT)	Detects that the gear is in neutral.
	Inhibitor switch (AT)	Detects shift positions.
	A/C switch	Detects ON-OFF operation of the A/C switch.
	Power steering switch	Detects the steering condition.
	Output signals	Fuel injector
Ignition signal		Turns the primary ignition current ON or OFF.
Electronic control throttle		Controls motor output to the electronic control throttle.
Oil flow control solenoid valve		Controls oil pressure for oil flow control solenoid valve.
Fuel pump control unit		Controls the fuel pump.
A/C control relay		Turns ON or OFF the A/C control relay.
Radiator fan control relay		Turns ON or OFF the radiator fan control relay.
Wastegate control solenoid valve		Controls supercharging pressure
Engine malfunction indicator light (MIL)		Indicates existence of abnormality.
Purge control solenoid valve		Controls purge of evaporative gas absorbed by the canister.
Tumble generator valve actuator		Operates the tumble generator valve.
Pressure control solenoid valve		Controls evaporation pressure in fuel tank.
Drain valve		Closes the evaporation line between the fuel tank and canister to detect leakage of evaporation gases.
Oil flow control solenoid valve		Controls advance and retard angles of the intake valves.
Heater circuit of front and rear oxygen sensors		Controls the heater of the front and rear oxygen sensors.
Electronic control throttle motor cut relay		Turns ON-OFF the electronic control throttle motor relay.
Power supply		Controls ON/OFF of the main power supply relay.

CONTROL SYSTEM

FUEL INJECTION (FUEL SYSTEM)

C: FUEL INJECTION CONTROL

- The ECM receives signals from various sensors and based on them, it determines the amount of fuel injected and the fuel injection timing. It performs the sequential fuel injection control over the entire engine operating range except during start-up of the engine.
- The amount of fuel injected depends upon the length of time the injector stays open. The fuel injection duration is determined according to varying operating condition of the engine. For the purpose of achieving highly responsive and accurate fuel injection duration control, the ECM performs a new feedback control that incorporates a learning feature as detailed later.
- The fuel injection control is performed such that fuel is injected accurately at the time when the maximum efficiency can be achieved for each cylinder.

1. FUEL INJECTION DURATION

Fuel injection duration is basically determined as indicated below:

- While cranking the engine:

The duration defined below is used.

- Duration of fuel injection during engine start-up Determined according to the engine coolant temperature detected by the engine coolant temperature sensor.

- During normal operation:

The duration is determined as follows:

Basic duration of fuel injection × Correction factors + Voltage correction time

- Basic duration of fuel injection The basic length of time fuel is injected. This is determined by two factors — the amount of intake air detected by the air flow sensor and the engine speed monitored by the crankshaft position sensor.
- Correction factors See the next section.
- Voltage correction time This is added to compensate for the time lag before operation of injector that results from variation in the battery voltage.

2. CORRECTION FACTORS

The following factors are used to correct the basic duration of fuel injection in order to make the air-fuel ratio meet the requirements of varying engine operating conditions:

- **Air-fuel ratio feedback factor:**

This factor is used to correct the basic duration of fuel injection in relation to the actual engine speed. (See the next section for more details.)

- **Start increment factor:**

This factor is used to increase the fuel injection duration only while the engine is being cranked to improve its startability.

- **Coolant-temperature-dependent increment factor:**

This factor is used to increase the fuel injection duration depending on engine coolant temperature signals to facilitate cold starting. The lower the coolant temperature, the greater the increment.

- **After-start increment factor:**

- This factor is used to increase the fuel injection duration for a certain period immediately after start of the engine to stabilize engine operation.
- The increment depends on the coolant temperature at the start of the engine.

- **Wide-open-throttle increment factor:**

This factor is used to increase the fuel injection duration depending on the relationship between the throttle position sensor signal and air flow sensor signal.

- **Acceleration increment factor:**

This factor is used to increase the fuel injection duration to compensate for a time lag between air flow measurement and fuel injection control for better engine response to driver's pedal operation during acceleration.

CONTROL SYSTEM

FUEL INJECTION (FUEL SYSTEM)

3. AIR-FUEL RATIO FEEDBACK FACTOR

The ECM creates this factor utilizing the front oxygen (A/F) sensor signal. When the signal is high, the air-fuel ratio is leaner than the stoichiometric ratio. The ECM then makes the fuel injection duration longer by modifying the factor. When the signal is low showing that the mixture is rich, the ECM modifies the factor to make the injection duration shorter. In this way, the air-fuel ratio is maintained at a level close to the stoichiometric ratio at which the three-way catalytic converter acts most effectively.

FU-00240

- (1) Front catalytic converter
- (2) Exhaust gases
- (3) Front oxygen (A/F) sensor
- (4) Fuel injector
- (5) Combustion chamber
- (6) ECM

- (A) Injection duration increment signal
- (B) Injection duration decrement signal
- (C) High oxygen density
- (D) Low oxygen density
- (E) Lean signal
- (F) Rich signal

4. LEARNING FEATURE

The air-fuel ratio feedback control includes a learning feature which contributes to more accurate and responsive control.

- In the air-fuel ratio feedback control, the ECM calculates the necessary amount of correction based on data from the front oxygen (A/F) sensor and adds the result to the basic duration (which is stored in the ECMs memory for each condition defined by the engine speed and various loads.)
- Without a learning feature, the ECM carries out the above-mentioned process every time. This means that if the amount of necessary correction is large, the air-fuel ratio feedback control becomes less responsive and less accurate.
- The learning feature enables the ECM to store the amount of correction into memory and add it to the basic fuel injection duration to create a new reference fuel injection duration. Using the reference duration as the basic duration for the injection a few times later, the ECM can reduce the amount of correction and thus make its feedback control more accurate and responsive to changes in the air-fuel ratio due to difference in driving condition and sensor/actuator characteristics that may result from unit-to-unit variation or aging over time.

CONTROL SYSTEM

FUEL INJECTION (FUEL SYSTEM)

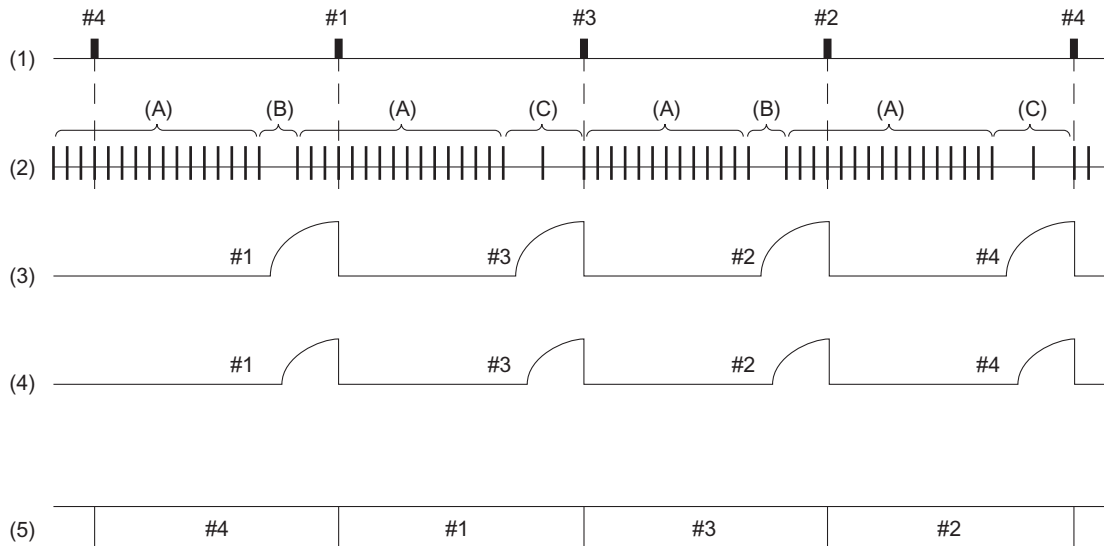

D: IGNITION CONTROL

- The ECM determines operating condition of the engine based on signals from the manifold absolute pressure sensor, engine coolant temperature sensor, intake air temperature sensor, crankshaft position sensor and other sources. The ECM then selects the ignition timing most appropriate for the condition thus determined from those stored in its memory and outputs at that timing a primary current OFF signal to the igniter to initiate ignition.
- This control uses a quick-to-response learning feature by which the data stored in the ECM memory is processed in comparison with information from various sensors and switches.
- Thus, the ECM can always perform optimum ignition timing taking into account the output, fuel consumption, exhaust gas, and other factors for every engine operating condition.
- Ignition control during start-up
Engine speed fluctuates during start of the engine, so the ECM cannot control the ignition timing. During that period, the ignition timing is fixed at 10° BTDC by using the 10° signal from the crankshaft position sensor.

FU-02164

- The ECM identifies cylinders at TDC and determines ignition timing as follows:
 - Within the range (A), the crank angle signal is input every 10° rotation of the crankshaft.
 - The ECM discriminates a TDC cylinder group from the other by detecting the ranges (B) and (C) where no signals are input.
 - The ECM judges that the No. 1 and No. 2 cylinders are at TDC when it detects the range (B), and that the No. 3 and No. 4 cylinders are at TDC when it detects the range (C).

FU-00358

- (1) Cylinder number (TDC)
- (2) Crank angle pulse
- (3) Ignition timing at starting
- (4) Ignition timing at normal condition
- (5) Cylinder at combustion

CONTROL SYSTEM

FUEL INJECTION (FUEL SYSTEM)

E: IDLE AIR CONTROL

• The ECM controls the electronic control throttle based on signals from the crankshaft position sensor, engine coolant temperature sensor, air flow sensor, manifold absolute pressure sensor and A/C switch so that the proper idle speed for each engine load is achieved.

FU-00359

- | | |
|---------------------------------------|----------------------------------|
| (1) Crankshaft position sensor | (6) Ignition switch |
| (2) Camshaft position sensor | (7) A/C switch |
| (3) Throttle position sensor | (8) Neutral position switch |
| (4) Engine coolant temperature sensor | (9) ECM |
| (5) Vehicle speed sensor | (10) Electronic control throttle |

F: FUEL PUMP CONTROL

The ECM controls the operation of the fuel pump through the fuel pump control unit, based on signals from the crankshaft position sensor. To improve safety, a “fuel pump stop signal” is sent from the ECM to the fuel pump control unit to stop the fuel pump if the engine stalls while the ignition switch is ON.

Ignition switch ON	Fuel pump
A certain period of time after ignition switch is turned ON	Operates
While cranking the engine	Operates
While engine is operating	Operates
When engine stops	Does not operate

6. On-board Diagnosis System

A: GENERAL

- The on-board diagnosis system detects and indicates a fault by generating a code corresponding to each fault location. The engine malfunction indicator light on the combination meter indicates occurrence of a fault or abnormality.
- When the malfunction indicator light comes on as a result of detection of a fault by the ECM, the corresponding diagnostic trouble code (DTC) and freeze frame data indicating the engine condition are stored in the ECM.
- On the OBD-II conformable car, it is necessary to connect the SUBARU Select Monitor (SSM) or General Scan Tool (GST) to the data link connector in order to check for DTCs.
- The SSM and GST can be used for erasing DTCs. These can also read freeze frame data in addition to other pieces of engine data.
- If there is a failure involving sensors, which may affect drive control of the vehicle, the fail-safe function ensures minimum level of drivability.

B: FAIL-SAFE FUNCTION

For a sensor or switch which has been judged faulty in the on-board diagnosis, the ECM, if appropriate, generates an associated pseudo signal to keep the vehicle operational. (The control becomes degraded.)

SYSTEM OVERVIEW

EMISSION CONTROL (AUX. EMISSION CONTROL DEVICES)

1. System Overview

There are three emission control systems, which are as follows:

- Crankcase emission control system
- Exhaust emission control system
 - Catalytic converter
 - Air/fuel (A/F) control system
 - Ignition control system
- Evaporative emission control system
 - On-board refueling vapor recovery (ORVR) system

SYSTEM OVERVIEW

EMISSION CONTROL (AUX. EMISSION CONTROL DEVICES)

Item			Main components	Function
Crankcase emission control system			Positive crankcase ventilation (PCV) valve	Draws blow-by gas into intake manifold from crankcase and burn it together with air-fuel mixture. Amount of blow-by gas to be drawn in is controlled by intake manifold pressure.
Exhaust emission control system	Catalytic converter	Pre	Catalytic converter	Oxidizes HC and CO contained in exhaust gases as well as reducing NOx.
		Front		
		Rear		
	Air/fuel (A/F) control system		Engine control module (ECM)	Receives input signals from various sensors, compares signals with stored data, and emits a signal for optimal control of air-fuel mixture ratio.
			Front oxygen (A/F) sensor	Detects density of oxygen contained exhaust gases.
			Rear oxygen sensor	Detects density of oxygen contained in exhaust gases.
			Throttle position sensor	Detects throttle opening.
			Manifold absolute pressure sensor	Detects absolute pressure of intake manifold.
			Mass air flow and intake air temperature sensor	Detects amount of intake air.
				Detects intake air temperature at air cleaner case.
Ignition control system		ECM	Receives various signals, compares signals with basic data stored in memory, and emits a signal for optimal control of ignition timing.	
		Crankshaft position sensor	Detects engine speed (revolution).	
		Camshaft position sensor	Detects reference signal for combustion cylinder discrimination.	
		Engine coolant temperature sensor	Detects coolant temperature.	
		Knock sensor	Detects engine knocking.	
Evaporative emission control system			Canister	Absorbs evaporative gas that accumulates in fuel tank when engine stops, and releases it to combustion chambers for a complete burn when the engine is started. This prevents HC from being discharged into atmosphere.
			Purge control solenoid valve	Receives a signal from ECM and controls purge of evaporative gas absorbed by canister.
			Pressure control solenoid valve	Receives a signal from ECM and controls evaporative gas pressure in fuel tank.
ORVR system			Vent valve	Closes the port to the canister when the fuel tank is full of fuel.
			Drain valve	Closes the evaporation line by receiving a signal from ECM to check the evaporation gas leak.

CRANKCASE EMISSION CONTROL SYSTEM

EMISSION CONTROL (AUX. EMISSION CONTROL DEVICES)

3. Crankcase Emission Control System

- The positive crankcase ventilation (PCV) system prevents air pollution that will be caused by blow-by gas being emitted from the crankcase.

The system consists of a sealed oil filler cap, rocker covers with fresh air inlet, connecting hoses, a PCV valve and an air intake duct.

- In a part-throttle condition, the blow-by gas in the crankcase flows into the intake manifold through the connecting hose of crankcase and PCV valve by the strong vacuum created in the intake manifold. Under this condition, fresh air is introduced into the crankcase through the connecting hose of the rocker cover.

- In a wide-open-throttle condition, a part of blow-by gas flows into the air intake duct through the connecting hose and is drawn into the throttle chamber, because under this is condition, the intake manifold vacuum is not strong enough to introduce through the PCV valve all blow-by gases that increase in the amount with engine speed.

- The PCV hose is provided with a leak detection function.

| (2) PCV valve | (7) Spring | |
| (3) Intake manifold | (8) PCV valve | |
| (4) Crankcase | (9) PCV hose assembly | |
| (5) Case | | |

4. Catalytic Converter

- The basic materials of the three-way catalytic converter are platinum (Pt), rhodium (Rh) and palladium (Pd), and a thin coat of their mixture is applied onto a honeycomb or porous ceramic (carrier). To avoid damaging the catalytic converter, only unleaded gasoline should be used.
- The catalytic converter reduces HC, CO and NO_x in exhaust gases through chemical reactions (oxidation and reduction). These harmful components are reduced most efficiently when their concentrations are in a certain balance. These concentrations vary with the air-fuel ratio. The ideal air-fuel ratio for reduction of these components is the stoichiometric ratio.
- Therefore, the air-fuel ratio needs to be controlled to around the stoichiometric ratio to purify the exhaust gases most efficiently.

AIR/FUEL (A/F) CONTROL SYSTEM

EMISSION CONTROL (AUX. EMISSION CONTROL DEVICES)

5. Air/fuel (A/F) Control System

- The air/fuel (A/F) control system makes a correction to the basic fuel injection duration in accordance with the signals from the front oxygen (A/F) sensor and the rear oxygen sensor so that the stoichiometric ratio is maintained, thus ensuring most effective exhaust gas purification by the three-way catalytic converter. Different basic fuel injection durations are preset for various engine speeds and loads, as well as the amount of intake air.
- This system also has a learning control function which stores the corrected data in relation to the basic fuel injection in the memory map. This allows an appropriate air-fuel ratio correction to be added automatically in quick response to any situation that requires such an effect. Thus, the air-fuel ratio is optimally maintained under various conditions while purifying exhaust gases most effectively, improving driving performance and compensating for changes in sensors' performance over time.

IGNITION CONTROL SYSTEM

EMISSION CONTROL (AUX. EMISSION CONTROL DEVICES)

6. Ignition Control System

- The ignition system is controlled by the ECM. The ECM monitors the operating condition of the engine using the signals from the sensors and switches shown below and determines the ignition timing most appropriate for each engine operating condition. Then it sends a signal to the igniter, commanding generation of a spark at that timing.
- The ECM uses a preprogrammed map for a “closed-loop” control which provides its ignition timing control with excellent transient characteristics, i.e., highly responsive ignition timing control.

EVAPORATIVE EMISSION CONTROL SYSTEM

EMISSION CONTROL (AUX. EMISSION CONTROL DEVICES)

7. Evaporative Emission Control System

A: GENERAL

- The evaporative emission control system prevents fuel vapors from escaping into atmosphere. This system includes a canister, purge control solenoid valve, fuel cut valve, and the lines connecting them.
- Fuel vapors in the fuel tank are introduced into the canister through the evaporation line, and are absorbed by activated carbon in it. The fuel cut valve is also incorporated in the fuel tank line.
- The purge control solenoid valve is controlled optimally by the ECM according to the engine condition.
- The pressure control solenoid valve incorporated in the fuel tank evaporation line regulates the pressure/vacuum in the fuel tank under the control of the ECM which uses the signal from the fuel tank pressure sensor.

- | | | |
|----------------------------------|-------------------------------------|-------------------------------------|
| (1) Fuel gauge | (7) Pressure control solenoid valve | (13) Fuel tank |
| (2) Intake manifold | (8) Drain valve | (14) Fuel cut valve |
| (3) Throttle body | (9) Drain filter | (15) Fuel tank pressure sensor |

| (5) ECM | (11) Fuel temperature sensor | (17) Fuel tank sensor control valve |
| (6) Canister | (12) Fuel level sensor | |

B: FUEL CUT VALVE

The fuel cut valve is incorporated in the fuel tank. The rising level of the fuel in the fuel tank causes the float to move up and close the cap hole so that no fuel can enter the evaporation line.

EVAPORATIVE EMISSION CONTROL SYSTEM

EMISSION CONTROL (AUX. EMISSION CONTROL DEVICES)

C: FUEL TANK CAP

- The fuel tank cap is of a quick lock type and can be opened or closed in 1/4 of a full turn.
- The fuel tank cap has a relief valve, which prevents development of vacuum in the fuel tank in the event of a problem with the fuel vapor line.

When there is no problem with the fuel vapor line, the filler pipe is sealed at the portion (A) and by the seal pressed against the filler pipe end. If vacuum develops in the fuel tank, the atmospheric pressure forces the spring down to open the valve; consequently outside air flows into the fuel tank, thus controlling the inside pressure.

EC-02109

- (1) Seal
- (2) Spring
- (3) Valve
- (4) Filter

EVAPORATIVE EMISSION CONTROL SYSTEM

EMISSION CONTROL (AUX. EMISSION CONTROL DEVICES)

D: CANISTER

The canister incorporates a drain valve and a drain filter.

The charcoal filled in the canister temporarily stores fuel vapors. When the purge control solenoid valve is opened by a signal from the ECM, the external fresh air entering the canister carries the fuel vapors into the collector chamber.

The drain filter is installed at the air inlet port of the drain valve. It cleans the air taken in the canister through the drain valve.

EMISSION CONTROL (AUX. EMISSION CONTROL DEVICES)

E: PURGE CONTROL SOLENOID VALVE

The purge control solenoid valve is on the evaporation line between the canister and intake manifold. The valve is installed under the intake manifold and lets the evaporative gas absorbed by the canister be drawn into the intake manifold.

EC-02001

- (A) To canister
- (B) To intake manifold

EVAPORATIVE EMISSION CONTROL SYSTEM

EMISSION CONTROL (AUX. EMISSION CONTROL DEVICES)

F: PRESSURE CONTROL SOLENOID VALVE

The fuel tank pressure control solenoid valve is located in the evaporation line between the canister and the fuel tank. It adjusts the fuel tank inside pressure under the control of the ECM.

When the tank inside pressure becomes higher than the atmospheric pressure, the valve is opened allowing fuel vapors to be introduced into the canister.

On the other hand, when the tank inside pressure becomes lower than the atmospheric pressure, external air is taken from the drain valve into the canister.

| (4) Diaphragm | |
| (5) Valve | |

G: VENT VALVE

The vent valve is located inside of the fuel tank. During filling the fuel tank, fuel vapors are introduced into the canister through the vent valve.

When the fuel vapor pressure becomes higher than the atmospheric pressure and overcomes the spring force which is applied to the back side of the diaphragm, the port toward the canister is opened. The vent valve also has a float which rises and block the port toward the canister when the fuel is full.

EVAPORATIVE EMISSION CONTROL SYSTEM

EMISSION CONTROL (AUX. EMISSION CONTROL DEVICES)

H: SHUT-OFF VALVE

The shut-off valve is located at the top of the fuel filler pipe. When a filler gun is inserted into the filler pipe, the shut-off valve closes the evaporation line.

ON-BOARD REFUELING VAPOR RECOVERY (ORVR) SYSTEM

EMISSION CONTROL (AUX. EMISSION CONTROL DEVICES)

8. On-board Refueling Vapor Recovery (ORVR) System

A: GENERAL

The on-board refueling vapor recovery system allows the fuel vapors in the fuel tank to be introduced directly into the canister through the vent valve when the fuel tank inside pressure increases as a result of refueling.

The diagnosis of the system is performed by monitoring the fuel tank inside pressure data from the fuel tank pressure sensor while forcibly closing the drain valve.

B: OPERATION

- While driving

Since the back side of the diaphragm in the pressure control solenoid valve is open to the atmosphere, the diaphragm is held pressed by the atmospheric pressure in the position where only the external air is introduced into the canister. When the fuel vapor pressure acting on the other side of the diaphragm increases and overcomes the atmospheric pressure, it pushes the diaphragm and opens the port through which the fuel vapors make their way to the canister.

EC-02094

| (3) Purge control solenoid valve | |

ON-BOARD REFUELING VAPOR RECOVERY (ORVR) SYSTEM

EMISSION CONTROL (AUX. EMISSION CONTROL DEVICES)

- While refueling

As the fuel enters the fuel tank, the tank inside pressure increases. When the inside pressure becomes higher than the atmospheric pressure, the port of the vent valve opens, allowing the fuel vapors to be introduced into the canister through the vent line. The fuel vapors are absorbed by charcoal in the canister, so the air discharged from the drain valve contains no fuel. When a filler gun is inserted, the shut-off valve closes the evaporation line.

- (5) Air intake duct
- (6) Resonator chamber

2. Turbocharger System

A: GENERAL

- The turbocharger system consists of a water-cooled turbocharger, air-cooled intercooler, wastegate control solenoid valve, etc.
- The turbine rotated by exhaust gas pressure rotates the compressor.
- As a result, the intake air is compressed by the compressor before it is delivered to the intake manifold.
- This turbocharger system controls the supercharging pressure according to changes in the atmospheric pressure. Even at a high altitude, therefore, the system offers stable performance without being affected by variations in atmospheric pressure.

TURBOCHARGER SYSTEM

INTAKE (INDUCTION)

B: TURBOCHARGER UNIT

The turbocharger is water-cooled. It utilizes a wastegate valve to adjust its supercharging pressure to an optimum level. The turbine is housed in a lightweight, thin-wall, heat-resistant casting. The compressor housing is made of thin-wall, aluminum alloy casting. The shaft for turbine and compressor is supported by a full-floating metal bearing system.

IN-02099

- (1) Wastegate controller

- (B) Exhaust gas outlet
- (C) Air outlet port
- (D) Coolant inlet

- (E) Lubricating oil inlet
- (F) Air inlet
- (G) Wastegate valve operation pressure

C: LUBRICATION OF TURBOCHARGER

The turbocharger is lubricated by engine oil branched out from the oil pump. To cope with very high speed of the turbocharger turbine and the compressor shaft which may reach a maximum of several hundred thousands of rpm, full-floating type bearings are used which can form adequate oil films on their inside and outside during running.

Further the oil supplied to the turbocharger also plays a role of cooling the turbine so that heat from exhaust gas does not transmitted to the bearings.

IN-00048

(1) Compressor housing

(3) Turbine housing

(2) Turbine wheel

(4) Compressor impeller

D: COOLING OF TURBOCHARGER

The turbocharger unit is cooled by engine coolant, which enhances the reliability and durability of the unit. The engine coolant from the coolant drain hose located under the cylinder head is led by a pipe to the coolant passage provided in the turbocharger bearing housing. After cooling the bearing housing, the engine coolant is led into the coolant filler tank through a pipe.

TURBOCHARGER SYSTEM

INTAKE (INDUCTION)

E: WASTEGATE CONTROL SOLENOID VALVE

The wastegate control solenoid valve switches the intake air pressure passages to the wastegate controller in response to signals from the ECM. When the solenoid valve opens, the intake air pressure upstream of the turbocharger unit is applied to the wastegate controller. When the solenoid valve closes, the intake air pressure downstream of the turbocharger unit (supercharged air pressure) is applied to the wastegate controller.

IN-02001

(1) Coil

TURBOCHARGER SYSTEM

INTAKE (INDUCTION)

F: REGULATION OF SUPERCHARGING PRESSURE

1. BASIC FUNCTION OF THE WASTEGATE VALVE

When the engine speed increases as the throttle valve opens, the amount of exhaust gas increases. This increases the speed of the turbine (approx. 20,000 to 150,000 rpm), the supercharging pressure and the engine output.

If the resultant supercharging pressure is extremely high, however, it may cause knocking and an excessively high thermal load on such engine components as pistons. In the worst case, the engine may be damaged or broken. To prevent this, the waste gate valve and its controller are provided. By sensing the supercharging pressure, the waste gate valve controller controls the operation of the waste gate valve to maintain the supercharging pressure at a predetermined level.

IN-00049

- (1) Wastegate valve
- (2) Turbocharger
- (3) Wastegate valve controller

TURBOCHARGER SYSTEM

INTAKE (INDUCTION)

While the supercharging pressure is lower than the predetermined level, the wastegate valve is closed so that entire exhaust gas is directed to the turbine.

IN-00050

When the supercharging pressure reaches the predetermined level, the wastegate controller lets the supercharging pressure press the diaphragm. This causes the wastegate valve to open through a linkage. With the wastegate valve open, part of the exhaust gas is allowed to flow into the exhaust gas pipe that bypasses the passage to the turbine.

This decreases the exhaust gas pressure that rotates the turbine and keeps the supercharging pressure constant.

- It means $P_2 - P_1 = \text{constant}$.

P_1 : Atmospheric pressure

P_2 : Supercharging pressure

IN-00051

TURBOCHARGER SYSTEM

INTAKE (INDUCTION)

2. CONCEPT OF THE WASTEGATE VALVE CONTROL

At high altitudes, the atmospheric pressure (P_1) is low, so that the supercharging pressure (P_2) is also low in a conventional system. The wastegate solenoid valve operates in such a way that a constant supercharging pressure (P_2) is maintained by acting in response to change in the atmospheric pressure.

IN-02002

(1) ECU

G: INTERCOOLER

- Since the intake air having passed through the turbocharger unit is heated to a very high temperature, the air itself expands, resulting in a lower supercharging efficiency. The intercooler is provided just before the throttle body to cool down the intake air and improve the boosting efficiency.
- The intercooler is an air cooled type. The air delivered from the air intake duct provided at the engine hood flows through the core and cools the intake air passing through the intercooler.

IN-02100

- (A) From turbocharger
- (B) To throttle body

TURBOCHARGER SYSTEM

INTAKE (INDUCTION)

H: AIR BYPASS VALVE

When a throttle valve is suddenly closed, a surge may occur due to a sudden rise of the air pressure in the passage between the turbocharger and throttle body. To prevent this, an air bypass valve and air passage are provided. The air bypass valve, actuated by the vacuum created by a sudden closure of the throttle valve, allows the suction air to bypass the turbocharger and flow directly upstream, thus lowering the pressure in the air passage.

IN-02003

- (A) To intake manifold
- (B) To turbocharger inlet duct
- (C) From intercooler

GENERAL

MECHANICAL

1. General

The engine used in this vehicle is of a horizontally opposed, four-cylinder design. This four-stroke-cycle, water-cooled, DOHC turbocharged engine uses a total of 16 valves and its main components are made of aluminum alloy. It is fueled by a multiple fuel injection system.

The engine's major structural and functional features are as follows:

- The cylinder head forms pent roof combustion chambers, each having a spark plug located at its center and two each of intake and exhaust valves (four valves per cylinder). The intake and exhaust ports are located in a cross-flow arrangement.
- A single timing belt drives four camshafts on the left and right banks and the water pump on the left bank. Belt tension is automatically adjusted by a belt tension adjuster, eliminating need for manual adjustment.
- The crankshaft is supported at five journals with high rigidity and strength.
- The cylinder block is made of cast aluminum, and cast iron cylinder liners are cast in.

| (3) Piston | (7) Spark plug | (11) Exhaust valve |
| (4) Cylinder block | (8) Valve rocker cover | (12) Exhaust camshaft |

2. Timing Belt

- A single timing belt drives four camshafts (intake and exhaust camshafts on each bank). The belt also drives the water pump by its non-toothed side.
- The timing belt teeth have a specially designed round profile which contributes to quiet operation. The timing belt is made of strong and inflexible core cords, wear-resistant canvas and heat-resistant rubber material.
- A hydraulic automatic belt tension adjuster always keeps the belt taut to the specified tension. Any manual belt tension adjustment is unnecessary.

| (8) Exhaust camshaft sprocket LH | |

NOTE:

*: The #1 piston is set at the top dead center (TDC) when the piston-position mark on the crankshaft sprocket is aligned with the mark on cylinder block.

** : The #1 piston is set at TDC on the compression stroke when the piston-position mark on the camshaft sprocket is facing directly upward.

AUTOMATIC BELT TENSION ADJUSTER

MECHANICAL

3. Automatic Belt Tension Adjuster

The automatic belt tension adjuster consists of a tensioner unit and a bracket. It maintains the timing belt tension automatically at a specified level to enable the belt to transmit power correctly, reduce operating noise and increase the life of the belt.

The cylinder of the tensioner unit incorporates an adjuster rod, wear ring, plunger spring, return spring, check ball and silicone oil.

The automatic belt tension adjuster gives tension to the belt by a levering action which is produced by the push force of the tensioner unit's adjuster rod. It operates in the process detailed below.

ME-00314

- | | |
|---------------------------|--------------------------|
| (1) Oil seal | (8) Plunger spring |
| (2) Wear ring | (9) Check ball |
| (3) Oil reservoir chamber | (10) Timing belt |
| (4) Return spring | (11) Belt tension pulley |
| (5) Adjuster rod | (12) Tensioner bracket |
| (6) Plunger | (13) Cylinder |
| (7) Oil pressure chamber | |

- Timing belt tensioning action

When the belt becomes slack, the adjuster rod is pushed upward by the return spring. The oil in the reservoir chamber, which is pressurized by the plunger spring to a certain level, pushes open the check ball and flows into the oil pressure chamber to keep the pressure constant.

The thrust force F resulting from extension of the adjuster rod applies a counterclockwise torque to the tensioner bracket, which causes the belt tension pulley at its end to turn in the same direction. This applies tensioning pressure P_b to the timing belt.

- Timing belt tension balancing action

When the belt tension pulley is pushed against the timing belt with pressure P_b , reaction force T_b of the timing belt generates the reaction force P at the point on which the adjuster rod force is acting. This force P pushes the adjuster rod until it balances with the sum of the thrust force F and the pressure of the oil in the oil pressure chamber. Therefore, the timing belt tension is kept constant.

- Over-tension correction action

If the tension of the timing belt increases excessively, the force P becomes larger than the thrust force F and silicone oil is returned from the oil pressure chamber to the reservoir chamber little by little until the force P balances again with the thrust force F . Thus the timing belt tension is maintained at the specified level at all times.

BELT COVER

MECHANICAL

4. Belt Cover

- The belt cover is made of lightweight, heat resistant synthetic resin molding. It constitutes a totally enclosed housing with its cylinder block mating edges sealed with rubber gaskets. This effectively protects the inside components from dust and liquid.
- Rubber seals used between the cylinder block and the belt cover effectively reduces transmission of noise and vibration.
- The front belt cover has a line mark for ignition-timing checking.

ME-00823

5. Camshaft

The DOHC engine uses four camshafts in all; intake and exhaust camshafts on each of the right and left banks.

The camshafts are of a composite material type using sintered steel for cam lobes and carbon steel for pipe part.

The sintered steel cams are very high in the resistance to wear, which enables the cam lift to be increased. In addition, use of a hollow pipe material contributes to reduction in weight.

Each camshaft is supported at its three journals and held in position by three camshaft caps. The two flanges on each camshaft supports thrust forces to limit the end play of the camshaft within the tolerance.

For DOHC turbo model engines, slots (notches) for variable valve timing position sensors are provided at the intake side.

ME(H4DOTC)-8

6. Cylinder Head

- The cylinder head is made of low pressure cast aluminum.
- Each combustion chamber in the cylinder head is a compact, pent roof design. The spark plug is located at the center of the combustion chamber, which contributes to creation of a wide “squish area” for increased combustion efficiency.
- The two intake and two exhaust valves are arranged on opposite sides for a cross-flow feature.
- The cylinder head gasket is a metallic gasket consisting of three layers of the stainless steel sheets. The gasket is highly resistant to heat and maintains high level of sealing performance for a long period.

ME-00793

- (1) Intake valve
- (2) Intake port
- (3) Squish area
- (4) Combustion chamber

- (5) Exhaust port
- (6) Exhaust valve
- (7) Spark plug

CYLINDER BLOCK

MECHANICAL

7. Cylinder Block

- The cylinder block is made of aluminum die casting. A semi-closed deck structure is used to obtain a higher rigidity to hold the cylinder liners.
- The cylinder liners are made of cast iron. As they are of a dry type, their outer surfaces are entirely in contact with the cylinder block.
- The cylinder block supports the crankshaft at its five journals. The journal supporting portions are designed such that sufficient stiffness and quiet operation are ensured.
- Sintered material is fit in the casting at the #5 journal to achieve further quietness.
- The oil pump is located in the front center of the cylinder block and the water pump is located at the front of the left-cylinder bank. At the rear of the right-cylinder bank is an oil separator which removes oil mist contained in blow-by gas.

8. Crankshaft

The crankshaft is supported in the cylinder block at five journals. Each corner formed by a journal or pin and a web is finished by fillet-rolling method, which increases strength of that area. The five crankshaft bearings are made of aluminum alloy and the No. 5 bearing is provided with a flanged metal to support thrust forces.

ME-00319

PISTON

MECHANICAL

9. Piston

- The pistons are of a slipper skirt design for reduced weight and friction. The piston is also a thermal flow type whose oil control ring groove is provided with round oil drain holes.
- The piston pin is offset toward the thrust side (No. 1 and No. 3 downwards, No. 2 and No. 4 upwards) to reduce piston slap noises.
- The piston head has recesses to prevent interference with the intake and exhaust valves. It also has engraved marks to identify the piston size and the direction of installation. All the pistons are common in their design.
- Three piston rings are used for each piston; two compression rings and one oil control ring. The top piston ring has inner bevels and the second piston ring has a cut on the bottom outside to reduce oil consumption.

ME-00791

- (1) Identification mark

- (A) Top ring
(B) Second ring
(C) Oil ring

- (a) Inner-bevel
(b) Cut
(c) Upper rail
(d) Spacer
(e) Lower rail

10. Variable Valve Timing System

This engine has a variable valve timing system, which adjusts the opening and closing timings of the valves optimally by continuously changing the phase angle of the camshaft sprocket relative to the camshaft.

- The ECM determines the optimal cam angle relative to the crank angle by making reference to the engine speed, vehicle speed, throttle opening and other relevant parameters.
- Under the control of the ECM, the oil flow control solenoid valve moves its spool to switch the hydraulic passage to/from the advance and retard chambers that are formed in the camshaft sprocket to change continuously the phase angle between the camshaft sprocket and camshaft.

A: PHASE ANGLE ADVANCES

In response to an advance signal from the ECM, the oil flow control solenoid valve moves its spool such that hydraulic pressure is applied to the advance chamber in the camshaft sprocket. The sprocket is then turned in the direction in which its phase angle advances relative to the camshaft.

ME-00825

- (1) Variable valve timing controller (attached to camshaft sprocket)
- (2) Vane (attached to camshaft)
- (3) ECM
- (4) Oil flow control solenoid valve
- (5) Oil pressure
- (6) Turns in advance direction

VARIABLE VALVE TIMING SYSTEM

MECHANICAL

B: PHASE ANGLE RETARDS

In response to a retard signal from the ECM, the oil flow control solenoid valve moves its spool such that hydraulic pressure is applied to the retard chamber in the camshaft sprocket. The sprocket is then turned in the direction in which its phase angle retards relative to the camshaft.

ME-00826

- (1) Variable valve timing controller (attached to camshaft sprocket)
- (2) Vane (attached to camshaft)
- (3) ECM
- (4) Oil flow control solenoid valve
- (5) Oil pressure
- (6) Turns in retard direction

C: A CERTAIN PHASE ANGLE IS RETAINED

When the ECM issues a signal to keep the phase angle unchanged, the oil flow control solenoid valve moves its spool to the position at which the hydraulic pressures to/from both the chambers are blocked. The pressures in the chambers are thus maintained, so the phase angle does not change and the intake valves' opening and closing timings also remain unchanged.

ME-00827

- (2) Vane (attached to camshaft)
- (3) ECM
- (4) Oil flow control solenoid valve
- (5) Oil pressure

SODIUM-FILLED EXHAUST VALVES

MECHANICAL

11.Sodium-filled Exhaust Valves

Each exhaust valve contains pure sodium in its hollow stem. Sodium has high thermal conductivity. The entrapped sodium will liquefy at high temperatures and move inside the stem as the valve is operated. Thus the sodium will effectively transfer heat from the valve head to the valve stem, contributing to cooling down the valve head faster.

ME-00750

(1) Pure sodium

12.Engine Mounting

ME-02441

- (1) Cushion rubber
- (2) Engine mounting cover

GENERAL

EXHAUST

1. General

- The exhaust system consists of left and right exhaust manifolds, a front joint pipe, a turbocharger joint pipe, a center exhaust pipe, a rear exhaust pipe and a muffler. The pre catalytic converter is incorporated in the turbocharger joint pipe, the front catalytic converter is incorporated in the center exhaust pipe, and the rear catalytic converter is incorporated in the rear exhaust pipe.
- The exhaust system features an excellent sound suppression design; the rear exhaust pipe has a chamber in addition to a large capacity muffler.

1. General

- The engine cooling system consists of a down-flow radiator which features high heat-dissipation performance, an electric-motor-driven fan, a water pump, a thermostat, and an engine coolant temperature sensor.
- The reservoir tank is made of translucent resin and enables easy confirmation of the coolant level. Also, coolant should be added to the reservoir tank when replenishment is necessary.
- The ECM controls the operation of the radiator main fan and sub fan depending on the signals from the engine coolant temperature sensor, vehicle speed sensor and A/C switch.

2. Cooling Circuits

The cooling system operates in three different phases depending on the temperature of the engine coolant.

- 1st phase (thermostat closed)

When the engine coolant temperature is below the preset temperature, the thermostat remains closed. The coolant flows through the heater circuit. This permits the engine to warm up quickly.

- 2nd phase (thermostat open)

When the engine coolant temperature becomes higher than the preset temperature, the thermostat opens. The coolant flows through the radiator where it is cooled.

- 3rd phase (thermostat open and radiator fan operating)

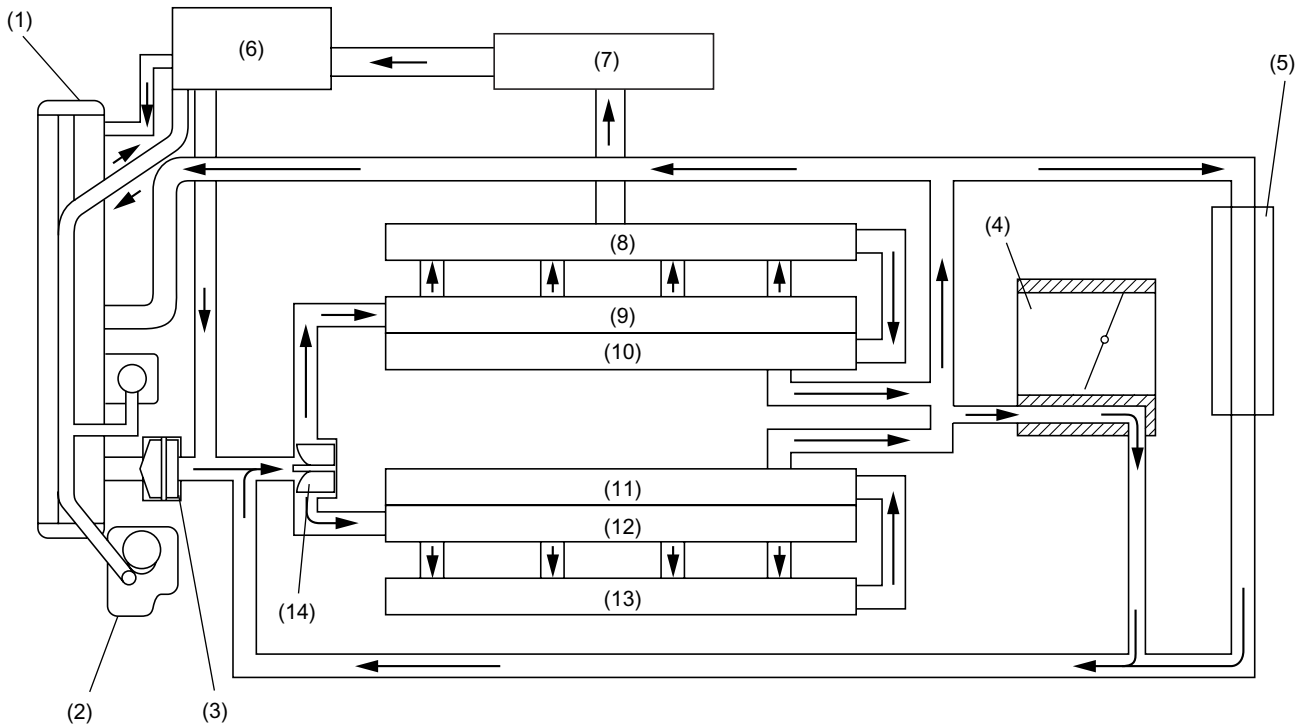

When the engine coolant temperature sensor becomes hotter than the preset value, the ECM receives signals from the engine coolant temperature sensor and causes the radiator fan(s) to operate. When the engine is stopped after high-speed operation, vapor produced in the turbocharger cooling section flows from the coolant filler tank to the reservoir tank where it condenses back into water. Water is then absorbed by the coolant filler tank as the engine cools down.

NOTE:

Refer to the Service Manual for preset engine coolant temperature values for each stage.

COOLING CIRCUITS

RADIATOR FAN

B: FUNCTION

The ECM receives signals from the engine coolant temperature sensor, vehicle speed sensor and A/C switch, and based on these signals, the ECM controls the radiator fan speed to high or low.

NOTE:

Refer to the Service Manual for operation of each model.

Operation example:

Vehicle speed	A/C compressor load	Engine coolant temperature		
		Rising: below 94°C (201°F) Lowering: below 91°C (196°F)	Rising: between 95 and 96°C (203 and 205°F) Lowering: between 92 and 94°C (198 and 201°F)	Rising: over 97°C (207°F) Lowering: over 95°C (203°F)
		Operation of radiator fans	Operation of radiator fans	Operation of radiator fans
When accelerating: below 19 km/h (12 MPH) When decelerating: below 10 km/h (6 MPH)	OFF	OFF	Low-speed	High-Speed
	Low	Low-Speed	Low-Speed	High-Speed
	High	High-Speed	High-Speed	High-Speed
When accelerating: between 20 and 69 km/h (12 and 43 MPH) When decelerating: between 11 and 64 km/h (7 and 40 MPH)	OFF	OFF	Low-Speed	High-Speed
	Low	High-Speed	High-Speed	High-Speed
	High	High-Speed	High-Speed	High-Speed
When accelerating: between 70 and 105 km/h (43 and 65 MPH) When decelerating: between 65 and 100 km/h (40 and 62 MPH)	OFF	OFF	Low-Speed	High-Speed
	Low	High-Speed	High-Speed	High-Speed
	High	High-Speed	High-Speed	High-Speed
When accelerating: over 106 km/h (66 MPH) When decelerating: over 101 km/h (63 MPH)	OFF	OFF	High-Speed	High-Speed
	Low	High-Speed	High-Speed	High-Speed
	High	High-Speed	High-Speed	High-Speed

RADIATOR CAP

COOLING

7. Radiator Cap

The radiator cap at the coolant filler tank side has a pressure valve and a vacuum valve. When the radiator inner pressure becomes higher than specified, the pressure valve opens to send coolant to the reservoir tank. Also, when the radiator inner pressure becomes lower than the atmospheric pressure during the cooling down phase, the vacuum valve opens to send back coolant from the reservoir tank to the radiator. These functions prevent damage to the radiator components.

CO-00245

- (1) Pressure valve
- (2) Vacuum valve

8. Relief Valve Cap

The relief valve cap at the radiator side has a pressure valve. When the radiator inner pressure becomes higher than specified, the pressure valve opens to send coolant to the reservoir tank. This function prevents damage to the radiator components.

CAUTION:

Due to the difference in construction, the relief valve cap cannot be used in place of the radiator cap at the coolant filler tank side. If the relief valve cap is fit on the coolant filler tank, overheating may occur.

CO-00246

(1) Pressure valve

1. General

- The lubrication system force-circulates engine oil throughout the engine using an oil pump. The oil pressure is regulated by the relief valve built into the oil pump.
- The oil pump is a thin, large-diameter trochoid rotor type which can accommodate the engine's high output. The pump is directly driven by the crankshaft.
- The engine oil is cleaned by a full-flow, paper element type oil filter. The filter has a bypass valve which allows the engine oil to flow bypassing the filter if it is clogged.
- The inside of the oil pan is fitted with a baffle plate which reduces changes in the oil level due to movement of the vehicle, thus ensuring uninterrupted suction of oil.
- The engine oil discharged from the oil pump is delivered to the journal bearings, connecting rod bearings, and other parts requiring lubrication and cooling via the vertical passage in the right bank of the cylinder block, the oil filter, and the oil galleries in the right and left banks of the cylinder block.
- The engine oil is also distributed to each cylinder head valve mechanism at a proper flow rate achieved by metering by the orifice provided in each oil gallery.
- An oil cooler is installed to keep the engine oil in an optimum temperature range and prevent degradation of lubrication performance.

ENGINE OIL FLOW

LUBRICATION

2. Engine Oil Flow

LU-02101

3. Oil Pump

- The oil pump is a trochoid rotor type consisting of an inner rotor and outer rotor assembled with each other in a pump body. When the inner rotor is driven by the crankshaft, the outer rotor is rotated, changing the space between it and the inner rotor. The change in the space occurs because of the difference in the number of teeth between the rotors.
- Engine oil is carried from the inlet port to the discharge port. As the pump rotates, the space carrying the oil becomes smaller, thus the oil is pressurized and discharged from the outlet port.
- A relief valve is built in the oil pump at its discharge side. When the oil pressure becomes higher than the preset value, the relief valve regulates the pressure by sending excessive oil back to the inlet side.

- (9) Relief valve

OIL FILTER

4. Oil Filter

The oil filter is a full-flow filtering, cartridge type that utilizes a paper element. It also has a built-in bypass valve. If the filter gets clogged causing the oil pressure to exceed the preset value, the bypass valve opens and detours the engine oil to flow around the filter. The filter element has a special pleat design to increase the effective filtering area.

- (1) Oil seal
- (2) Filter body
- (3) Bypass valve
- (4) Pleated element

LU-00059

5. Oil Pan and Oil Strainer

- The oil pan is attached to the cylinder block using liquid gasket for sealing. The oil strainer is a metal net type and removes large foreign particles from the engine oil. It is located in the middle of the oil pan. The pipe from the strainer is connected to the suction port of the oil pump in the left bank of the cylinder block.
- There is a baffle plate inside the oil pan. It stabilizes the oil level and reinforces the oil pan.

- (1) Oil strainer
- (2) Level gauge guide
- (3) Baffle plate
- (4) Oil level gauge

- (a) LOW level

- (c) FULL level (engine cold condition)

OIL PRESSURE SWITCH

LUBRICATION

6. Oil Pressure Switch

The oil pressure switch is located in the front upper portion of the right cylinder block bank. The purpose of this switch is to monitor the operation of the oil pump as well as the lubricating oil pressure when the engine is running.

LU-00061

- | | |
|---------------|--------------------|
| (1) Contact | (4) Molded portion |
| (2) Diaphragm | (5) Terminal |
| (3) Spring | |

1) When oil pressure does not build up (immediately after ignition switch is turned ON):
The diaphragm is pushed toward the cylinder block by the spring force (a force equivalent to the specified oil pressure). This closes the contact points, causing the oil pressure warning light in the combination meter to illuminate.

2) When oil pressure reaches the specified value (after engine starts):
After reaching the specified value, the oil pressure pushes the diaphragm against the spring force. This opens the contact points and the oil pressure warning light goes out.

7. Oil Cooler

The oil cooler used in turbo models is of a water cooled type. It serves to maintain engine oil in proper temperature range and so prevent degradation of lubricating oil performance.

GENERAL

FUEL INJECTION (FUEL SYSTEM)

1. General

- The Multipoint Fuel Injection (MFI) system supplies optimum air-fuel mixture under every engine operating condition through the use of the latest electronic control technology.

This system pressurizes the fuel to a constant pressure and injects it into each intake air port in the cylinder head. The injection quantity of fuel is controlled by an intermittent injection system where an electro-magnetic injection valve or injector opens for a short period that is precisely controlled depending on the quantity of air appropriate for each condition of operation. In actual control, an optimum fuel injection quantity is achieved by varying the duration of an electric pulse applied to the injector. This way of control enables simple, yet highly precise metering of the fuel.

- The engine control module (ECM) that controls the fuel injection system corrects the fuel injection amount depending on the vehicle speed, throttle opening, coolant temperature and other vehicle-operation-related information. The ECM receives the information in the form of electric signals from the corresponding sensors and switches.

The MFI system also has the following features:

- Reduced exhaust emissions
- Improves fuel efficiency
- Increased engine output
- Quick response to accelerator and brake pedal operation
- Superior start ability and warm-up performance in cold weather due to corrective controls made according to coolant and intake air temperatures

2. Air Line

A: GENERAL

The air filtered by the air cleaner enters the throttle body where it is regulated in the volume by the throttle valve and then enters the intake manifold. It is then distributed to each cylinder where the air is mixed with fuel injected by the injector.

B: MANIFOLD ABSOLUTE PRESSURE SENSOR

The manifold absolute pressure sensor is attached to the top of the throttle body, and continuously sends to the engine control module (ECM) voltage signals that are proportional to intake manifold absolute pressures. The ECM controls the fuel injection and ignition timing based on the intake manifold absolute pressure signals in addition to other signals from many sensors and other control modules.

FU-02152

(1) Manifold absolute pressure sensor

(A) Output voltage

(B) Absolute pressure

AIR LINE

FUEL INJECTION (FUEL SYSTEM)

C: ELECTRONIC CONTROL THROTTLE SYSTEM

- The electronic control throttle system consists of an accelerator pedal position sensor mounted on the accelerator pedal, a throttle position sensor and a throttle motor mounted on the throttle body, and the ECM, which controls these devices.
- The movement of the accelerator pedal is converted into electrical signals by the accelerator pedal position sensor and sent to the ECM. Based on these signals the ECM controls the throttle motor to open and close the throttle valve.
- Idling control is now performed by the electronic control throttle system in place of the idle air control solenoid valve.

FUEL INJECTION (FUEL SYSTEM)

D: MASS AIR FLOW AND INTAKE AIR TEMPERATURE SENSOR

The mass air flow and the intake air temperature sensors are integrated into a single unit. The unit is mounted on the air cleaner case and measures the amount as well as the temperature of the intake air.

The measured amount and temperature are converted into electrical signals and sent to the ECM. The ECM uses these signals to control injection and ignition timing as well as the fuel injection amount.

(A) Air

FUEL SYSTEM

FUEL INJECTION (FUEL SYSTEM)

3. Fuel System

A: GENERAL

- The fuel pressurized by the fuel tank inside pump is delivered to each fuel injector by way of the fuel pipe and fuel filter. Fuel injection pressure is regulated to an optimum level by the pressure regulator.
- Each injector injects fuel into the intake port of the corresponding cylinder where the fuel is mixed with air. The mixture then enters the cylinder. Fuel injection amount and timing are regulated by the ECM.

FUEL SYSTEM

FUEL INJECTION (FUEL SYSTEM)

B: PRESSURE REGULATOR

The pressure regulator is installed at the injector end of the fuel supply line. It has a fuel chamber and spring chamber separated by a diaphragm. The fuel chamber is connected to the fuel supply line and the spring chamber is connected to the intake manifold. Fuel chamber also has a relief valve connected to the fuel return line through which fuel returns to the fuel tank. When the intake manifold vacuum increases, the diaphragm is pulled and the relief valve opens to decrease the fuel supply line pressure (or fuel injection pressure). When the intake manifold vacuum decreases, the diaphragm is pushed by the spring to increase the fuel supply line pressure. Thus, the difference between the fuel injection pressure and the intake manifold vacuum is kept at a constant level of 343 kPa (3.50 kgf/cm², 49.7 psi) to precisely control the amount of injected fuel.

FU(H6DO)-7

FUEL SYSTEM

FUEL INJECTION (FUEL SYSTEM)

C: FUEL INJECTOR

- The MFI system employs top feed type fuel injectors.
- Each injector is installed in the fuel pipe in such a way that the injector is cooled by fuel.
- The features of this type of fuel injector are as follows:
 - 1) High heat resistance
 - 2) Low driving noise
 - 3) Easy to service
 - 4) Small size
- The injector injects fuel according to the valve open signal from the ECM. The needle valve is lifted by the solenoid, which is energized on arrival of the valve open signal.
- Since the injector's nozzle hole area, the lift of valve and the fuel pressure are kept constant, the amount of fuel injected is controlled only by varying the duration of the valve open signal from the ECM.
- The multi-hole nozzle makes it possible for the injector to produce fine fuel particles, which enhances the combustion efficiency and output performance of the engine.

FU(H6DO)-8

FUEL SYSTEM

FUEL INJECTION (FUEL SYSTEM)

D: FUEL TANK

The fuel tank utilizes a two-compartment design to ensure sufficient capacity without interfering with the rear differential. It is provided with a suction jet pump (included in the fuel pump and fuel level sensor assembly) which transfers fuel from one compartment to the other.

Each compartment has an individual fuel level sensor. The fuel tank is located under the rear seat and secured with hold-down bands.

FU(H6DO)-9

FUEL SYSTEM

FUEL INJECTION (FUEL SYSTEM)

E: FUEL PUMP AND FUEL LEVEL SENSOR ASSEMBLY

1. FUEL PUMP

The fuel pump consists of a motor, impeller, pump casing, pump cover, check valve and filter. It is located in the fuel tank and combined with the fuel level sensor and fuel temperature sensor into a single unit. The operation of this impeller type pump is very quiet.

- When the ignition switch is turned ON, fuel pump relay is activated. Then the motor operates to rotate the impeller.
- As the impeller rotates, fuel in a vane groove of the impeller flows along the fuel passage into the next vane groove by centrifugal force. When fuel flows from one groove to the next, a pressure difference occurs due to friction. This creates a pumping effect.
- The fuel pushed up by rotation of the impeller then passes through the clearance between the armature and the magnet of the motor and is discharged through the check valve.
- When the fuel discharge pressure reaches the specified level, the relief valve opens and excess fuel is released into the fuel tank. In this manner, the relief valve prevents an abnormal increase in fuel pressure.
- When the engine and the fuel pump stop, the check valve operates to close the discharge port, so that the fuel pressure in the fuel delivery line is retained.

2. FUEL LEVEL SENSOR

The fuel level sensor is integrated with the fuel pump, which is located in the fuel tank. The sensor outputs an electric resistance signal that varies with movement of its float to indicate the level of the fuel remaining in the tank.

- (2) Fuel level sensor
- (3) Float

FU(H6DO)-10

FUEL SYSTEM

FUEL INJECTION (FUEL SYSTEM)

3. JET PUMP

- The jet pump utilizes the velocity of fuel returning from the engine to produce vacuum in it.
- Using the pumping effect produced by the vacuum, the jet pump transfers fuel from the sub-compartment and main compartment of the fuel tank to the fuel pump.
- When the return line nozzle is clogged, the fuel sent back through the return line flows back into the fuel tank via the relief valve.

FU-00226

FUEL SYSTEM

FUEL INJECTION (FUEL SYSTEM)

F: SUB-COMPARTMENT FUEL LEVEL SENSOR

This sensor detects the level of the fuel in the sub side (the side without a fuel pump) of the fuel tank. Also, when the jet pump is operating, fuel in the sub side is drawn up and transferred to the fuel pump.

- (1) Fuel level sensor
- (2) Float

(A) Jet pump

4. Sensors and Switches

A: FRONT OXYGEN (A/F) SENSOR

- The front oxygen (A/F) sensor uses zirconium oxide (ZrO_2), which is a solid electrolyte, at portions exposed to exhaust gas.
- The zirconium oxide has the property of generating electromotive force when its both sides are exposed to oxygen ions of different concentration and the magnitude of this electromotive force depends on how much the difference is.
The front oxygen (A/F) sensor detects the amount of oxygen in exhaust gases by making use of this property of the zirconium oxide material.
- The zirconium oxide material is formed into a closed end tube and its external surface is exposed to exhaust gases with smaller oxygen ion concentration, whereas its internal surface is exposed to atmospheric air. The external surface has a porous platinum coating. The sensor's inside is connected to the ECM through a harness to send the current output from the sensor.
- The sensor incorporates a ceramic heater to improve its performance at low temperatures.

FU-02163

- (1) Protection tube
- (2) Gasket
- (3) Sensor housing
- (4) Ceramic heater

SENSORS AND SWITCHES

FUEL INJECTION (FUEL SYSTEM)

- When rich air-fuel mixture is burnt in the cylinder, the oxygen in the exhaust gases is almost completely used in the catalytic reaction by the platinum coating on the external surface of the zirconium tube. This results in a very large difference in the oxygen ion concentration between the inside and outside of the tube, and the electromotive force generated is large.
- When a lean air-fuel mixture is burnt in the cylinder, relatively large amount of oxygen remains in the exhaust gases even after the catalytic action, and this results in a small difference in the oxygen ion concentration between the tube's internal and external surfaces. The electromotive force in this case is very small.
- The difference in oxygen concentration changes drastically in the vicinity of the stoichiometric air-fuel ratio, and hence the change in the electromotive force is also large. By using this information, the ECM can determine the air-fuel ratio of the supplied mixture easily. The front oxygen (A/F) sensor does not generate much electromotive force when the temperature is low. The output characteristics of the sensor stabilize at a temperature of approximately 700°C (1,292°F).

FU-02015

- (A) Current
- (B) Air/fuel ratio
- (C) Rich
- (D) Lean

SENSORS AND SWITCHES

FUEL INJECTION (FUEL SYSTEM)

B: REAR OXYGEN SENSOR

- The rear oxygen sensor is used to sense oxygen concentration in the exhaust gas. If the air-fuel ratio is leaner than the stoichiometric ratio in the mixture (i.e., excessive amount of air), the exhaust gas contains more oxygen. To the contrary, if the fuel ratio is richer than the stoichiometric ratio, the exhaust gas contains almost no oxygen.
- By detecting the oxygen concentration in the exhaust gas using the oxygen sensor makes it possible to determine whether the air-fuel ratio is leaner or richer than the stoichiometric ratio.
- The rear oxygen sensor has a zirconium tube (ceramic), which generates voltage if there is a difference in oxygen ion concentration between the inside and outside of the tube. Platinum is coated on the inside and outside of the zirconium tube as a catalysis and electrode material. The sensor's inside is connected to the ECM through a harness.
- A ceramic heater is employed to improve performance at low temperatures.

FU-00353

- (2) Thermistor element

- (A) Resistance (k Ω)
- (B) Temperature °C (°F)

SENSORS AND SWITCHES

FUEL INJECTION (FUEL SYSTEM)

D: CRANKSHAFT POSITION SENSOR

- The crankshaft position sensor is installed on the rear end of the cylinder block. The sensor generates a pulse when one of the teeth on the perimeter of the crankshaft plate (rotating together with the crankshaft) passes in front of it. The ECM determines the crankshaft angular position by counting the number of pulses.
- As the crankshaft rotates, each tooth of the crankshaft plate aligns with the crankshaft position sensor so that the magnetic flux in the sensor's coil changes since the air gap between the sensor pickup and the crankshaft plate changes. This change in magnetic flux induces a voltage pulse in the sensor and the pulse is transmitted to the ECM.

FU-00609

G: VEHICLE SPEED SENSOR

Vehicle speed signals are sent from the vehicle speed sensor to the ABS control module or the vehicle dynamics control (VDC) control module.

The signals are sent to the ECM via CAN communication.<Ref. to LAN section.>

5. Control System

A: GENERAL

The ECM receives signals from various sensors, switches, and other control modules. Using these signals, it determines the engine operating conditions and if necessary, emits signals to one or more systems to control them for optimum operation.

Major control items of the ECM are as follows:

- Fuel injection control
- Ignition control
- Idle air control
- Fuel pump control
- Canister purge control*¹
- Radiator fan control*²
- On-board diagnosis function

*1: Canister purge control is described under EC (H6DO) section. <Ref. to EC(H6DO) section.>

*2: Radiator fan control is described under CO (H6DO) section. <Ref. to CO(H6DO) section.>

CONTROL SYSTEM

FUEL INJECTION (FUEL SYSTEM)

B: INPUT AND OUTPUT SIGNALS

Signal	Unit	Function
Input signals	Manifold absolute pressure sensor	Detects the amount (measures the absolute pressure) of intake air.
	Mass air flow and intake air temperature sensor	Detects the temperature and amount of intake air.
	Throttle position sensor	Detects the throttle valve position.
	Front oxygen (A/F) sensor	Detects the density of oxygen in exhaust gases at the upstream of the front catalytic converter.
	Rear oxygen sensor	Detects the density of oxygen in exhaust gases at the downstream of the rear catalytic converter.
	Crankshaft position sensor	Detects the crankshaft angular position.
	Camshaft position sensor	Detects the combustion cylinder.
	Engine coolant temperature sensor	Detects the engine coolant temperature.
	Knock sensor	Detects engine knocking.
	Accelerator pedal position sensor	Indicates the accelerator pedal position.
	Variable valve lift diagnosis oil pressure switch	Detects the oil pressure in the variable valve lift circuit.
	Oil temperature sensor	Detects the oil temperature in the variable valve lift circuit.
	Ignition switch	Detects operation of the ignition switch.
	Starter switch	Detects the condition of engine cranking.
	Power steering switch	Detects the steering condition.
	A/C mid pressure switch	Detects the A/C refrigerant pressure through an ON-OFF switch.
	Inhibitor switch	Detects shift positions.
	A/C switch	Detects ON-OFF operation of the A/C switch.
	Fuel temperature sensor	Detects the temperature of the fuel in the fuel tank.
	Fuel tank pressure sensor	Detects the pressure in the fuel tank.
Output signals	Fuel injector	Activates an injector.
	Ignition signal	Turns the primary ignition current ON or OFF.
	Electronic control throttle	Controls motor output for the electronic control throttle.
	Electronic control throttle motor cut relay	Turns ON-OFF the electronic control throttle motor relay.
	Oil flow control solenoid valve	Controls oil pressure for AVCS.
	Oil switching solenoid valve	Controls oil pressure for variable valve lift.
	Fuel pump control unit	Controls the fuel pump.
	A/C control relay	Turns ON or OFF the A/C control relay.
	Radiator fan control signal	Controls operation of radiator fans.
	Malfunction indicator light (MIL)	Indicates existence of abnormality.
	Pressure control solenoid valve	Controls evaporation pressure in the fuel tank.
	Drain valve	Closes the evaporation line between the fuel tank and canister to detect leakage of evaporation gas.
	Purge control solenoid valve	Controls purge of evaporative gas absorbed by the canister.
	Heater circuit of front and rear oxygen sensors	Controls heater of front and rear oxygen sensors.
	Power supply	Controls ON/OFF of the main power supply relay.

C: FUEL INJECTION CONTROL

- The ECM receives signals from various sensors and based on them, it determines the amount of fuel injected and the fuel injection timing. It performs the sequential fuel injection control over the entire engine operating range except during start-up of the engine.
- The amount of fuel injected depends upon the length of time the injector stays open. The fuel injection duration is determined according to varying operating condition of the engine. For the purpose of achieving highly responsive and accurate fuel injection duration control, the ECM performs a new feedback control that incorporates a learning feature as detailed later.
- Fuel injection control is performed in a way that fuel is injected accurately at the time when the maximum air intake efficiency can be achieved for each cylinder.

1. FUEL INJECTION DURATION

Fuel injection duration is basically determined as indicated below:

- While cranking the engine:

The duration defined below is used.

- Duration of fuel injection during engine start-up Determined according to the engine coolant temperature detected by the engine coolant temperature sensor.

- During normal operation:

The duration is determined as follows:

Basic duration of fuel injection × Correction factors + Voltage correction time

- Basic duration of fuel injection The basic length of time fuel is injected. This is determined by two factors — the amount of intake air detected by the air flow sensor and the engine speed monitored by the crankshaft position sensor.
- Correction factors See the next section.
- Voltage correction time This is added to compensate for the time lag before operation of injector that results from variation in the battery voltage.

CONTROL SYSTEM

FUEL INJECTION (FUEL SYSTEM)

2. CORRECTION FACTORS

The following factors are used to correct the basic duration of fuel injection in order to make the air-fuel ratio meet the requirements of varying engine operating conditions:

- Air-fuel ratio feedback factor:

This factor is used to correct the basic duration of fuel injection in relation to the actual engine speed. (See the next section for more details.)

- Start increment factor:

This factor is used to increase the fuel injection duration only while the engine is being cranked to improve its start ability.

- Coolant-temperature-dependent increment factor:

This factor is used to increase the fuel injection duration depending on engine coolant temperature signals to facilitate cold starting. The lower the coolant temperature, the greater becomes the increment.

- After-start increment factor:

- This factor is used to increase the fuel injection duration for a certain period immediately after start of the engine to stabilize engine operation.

- The increment depends on the coolant temperature at the start of the engine.

- Wide-open-throttle increment factor:

This factor is used to increase the fuel injection duration depending on the relationship between the throttle position sensor signal and air flow sensor signal.

- Acceleration increment factor:

This factor is used to increase the fuel injection duration to compensate for a time lag between air flow measurement and fuel injection control for better engine response to driver's pedal operation during acceleration.

CONTROL SYSTEM

FUEL INJECTION (FUEL SYSTEM)

3. AIR-FUEL RATIO FEEDBACK FACTOR

The ECM creates this factor utilizing the front oxygen (A/F) sensor signal. When the signal is high, the air-fuel ratio is leaner than the stoichiometric ratio. The ECM then makes the fuel injection duration longer by modifying the factor. When the signal is low showing that the mixture is rich, the ECM modifies the factor to make the injection duration longer. In this way, the air-fuel ratio is maintained at a level close to the stoichiometric ratio at which the three-way catalytic converter acts most effectively.

CONTROL SYSTEM

FUEL INJECTION (FUEL SYSTEM)

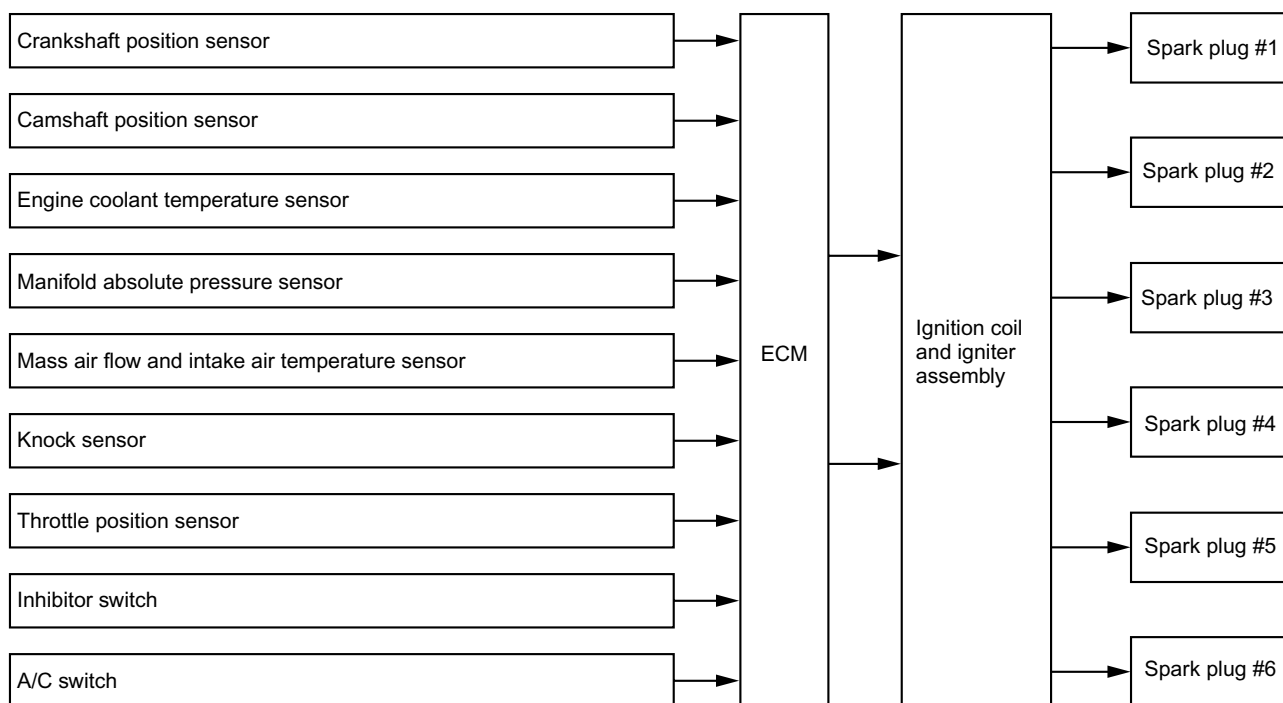

4. LEARNING FEATURE

The air-fuel ratio feedback control includes a learning feature, which contributes to more accurate and responsive control.

- In the air-fuel ratio feedback control, the ECM calculates the necessary amount of correction based on data from the front oxygen (A/F) sensor and adds the result to the basic duration (which is stored in the ECM's memory for each condition defined by the engine speed and various loads.)
- Without a learning feature, the ECM carries out the above-mentioned process every time. This means that if the amount of necessary correction is large, the air-fuel ratio feedback control becomes less responsive and less accurate.
- The learning feature enables the ECM to store the amount of correction into memory and add it to the basic fuel injection duration to create a new reference fuel injection duration. Using the reference duration as the basic duration for the injection a few times later, the ECM can reduce the amount of correction and thus make its feedback control more accurate and responsive to changes in the air-fuel ratio due to difference in driving condition and sensor/actuator characteristics that may result from unit-to-unit variation or aging over time.

D: IGNITION CONTROL

- The ECM determines operating condition of the engine based on signals from the mass air flow and intake air temperature sensor, manifold absolute pressure sensor, engine coolant temperature sensor, crankshaft position sensor and other sources. The ECM then selects the ignition timing most appropriate for the condition thus determined from those stored in its memory and outputs at that timing a primary current OFF signal to the igniter to initiate ignition.
- This control uses a quick-to-response learning feature by which the data stored in the ECM memory is processed in comparison with information from various sensors and switches.
- Thus, the ECM can always perform optimum ignition timing taking into account the output, fuel efficiency, exhaust gas, and other factors for every engine operating condition.
- Ignition control during start-up
 Engine speed fluctuates during start of the engine, so the ECM cannot control the ignition timing. During that period, the ignition timing is fixed at 10° BTDC by using the 10° signal from the crankshaft position sensor.

FU-02175

CONTROL SYSTEM

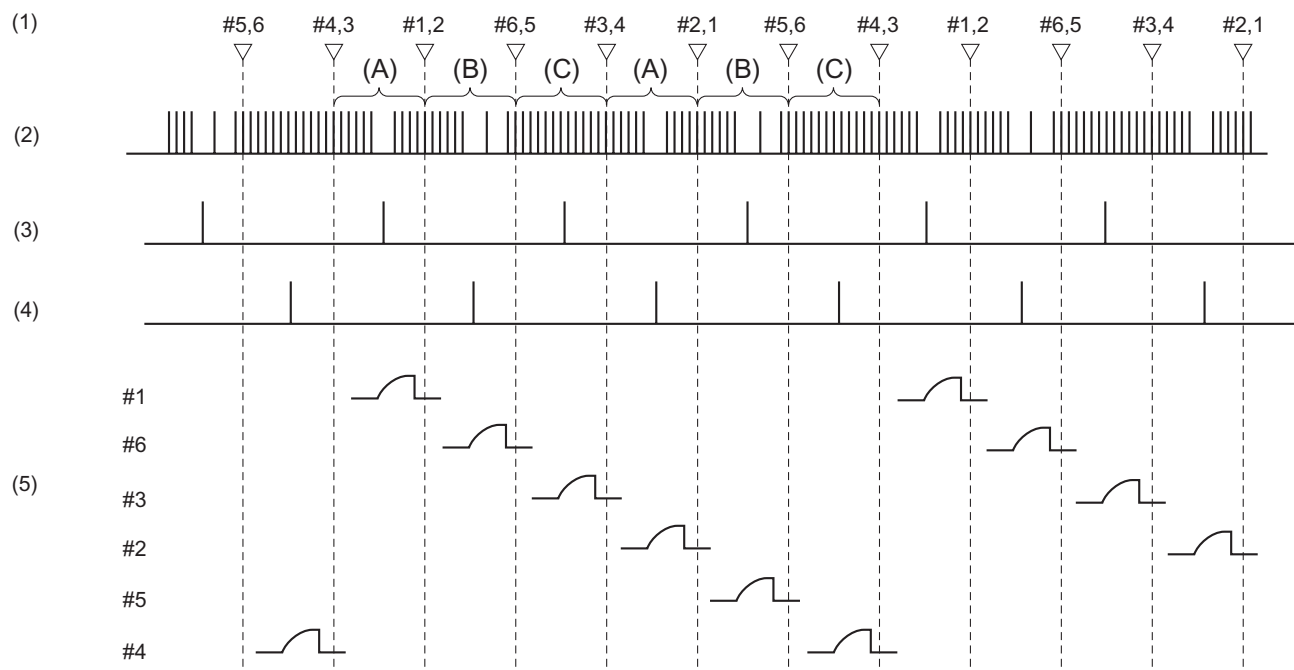

FUEL INJECTION (FUEL SYSTEM)

- On the sensor plate at the rear end of the crankshaft, there are projections placed at 10° and 30° intervals. The ECM receives crankshaft angle pulse signals that are generated when the crankshaft position sensor passes these projections.

Using crankshaft position sensor signals and camshaft position sensor pulse signals, the ECM determines the position of each piston as follows:

The ECM interprets the pulses of range (A) shown below as the No. 1 and No. 2 cylinder pistons being at TDC, the pulses of range (B) as the No. 5 and No. 6 cylinder pistons being at TDC, and the pulses of range (C) as the No. 3 and No. 4 cylinder pistons being at TDC.

- The ECM outputs an ignition signal for the No. 1, No. 3 or No. 5 cylinder when it receives a cam angle pulse (RH) before a TDC signal and for the No. 2, No. 4 or No. 6 cylinder when it receives a cam angle pulse (LH) before a TDC signal.

- (2) Crank angle pulse
- (3) Cam angle pulse (RH)
- (4) Cam angle pulse (LH)
- (5) Ignition timing

CONTROL SYSTEM

FUEL INJECTION (FUEL SYSTEM)

E: IDLE AIR CONTROL

• The ECM controls the electronic control throttle based on signals from the crankshaft position sensor, engine coolant temperature sensor, air flow and intake air temperature sensor, and A/C switch etc. so that the proper idle speed for each engine load is achieved.

FU-00614

- | | |
|---|----------------------------------|
| (1) Manifold absolute pressure sensor | (7) Vehicle speed sensor |
| (2) Mass air flow and intake air temperature sensor | (8) Ignition switch |

| (4) Camshaft position sensor | (10) Inhibitor switch |
| (5) Throttle position sensor | (11) ECM |
| (6) Engine coolant temperature sensor | (12) Electronic control throttle |

F: FUEL PUMP CONTROL

The ECM controls the operation of the fuel pump through the fuel pump control unit, based on signals from the crankshaft position sensor. To improve safety, a “fuel pump stop signal” is sent from the ECM to the fuel pump control unit to stop the fuel pump if the engine stalls while the ignition switch is ON.

Ignition switch ON	Fuel pump relay	Fuel pump
A certain period of time after ignition switch is turned ON	ON	Operates
While cranking the engine	ON	Operates
While engine is operating	ON	Operates
When engine stops	OFF	Does not operate

ON-BOARD DIAGNOSIS SYSTEM

FUEL INJECTION (FUEL SYSTEM)

6. On-board Diagnosis System

A: GENERAL

- The on-board diagnosis system detects and indicates a fault by generating a code corresponding to each fault location. The engine malfunction indicator light on the combination meter indicates occurrence of a fault or abnormality.
- When the malfunction indicator light comes on as a result of detection of a fault by the ECM, the corresponding diagnostic trouble code (DTC) and freeze frame data indicating the engine condition are stored in the ECM.
- On the OBD-II conformable car, it is necessary to connect the SUBARU Select Monitor (SSM) or General Scan Tool (GST) to the data link connector in order to check for DTCs.
- The SSM and GST can be used for erasing DTCs. These can also read freeze frame data in addition to other pieces of engine data.
- If there is a failure involving sensors, which may affect drive control of the vehicle, the fail-safe function ensures minimum level of drivability.

B: FAIL-SAFE FUNCTION

For a sensor or switch which has been judged faulty in the on-board diagnosis, the ECM, if appropriate, generates an associated pseudo signal to keep the vehicle operational. (The control becomes degraded.)

SYSTEM OVERVIEW

EMISSION CONTROL (AUX. EMISSION CONTROL DEVICES)

1. System Overview

There are three emission control systems, which are as follows:

- Crankcase emission control system
- Exhaust emission control system
 - Catalytic converter
 - Air/fuel (A/F) control system
 - Ignition control system
- Evaporative emission control system
 - On-board refueling vapor recovery (ORVR) system

SYSTEM OVERVIEW

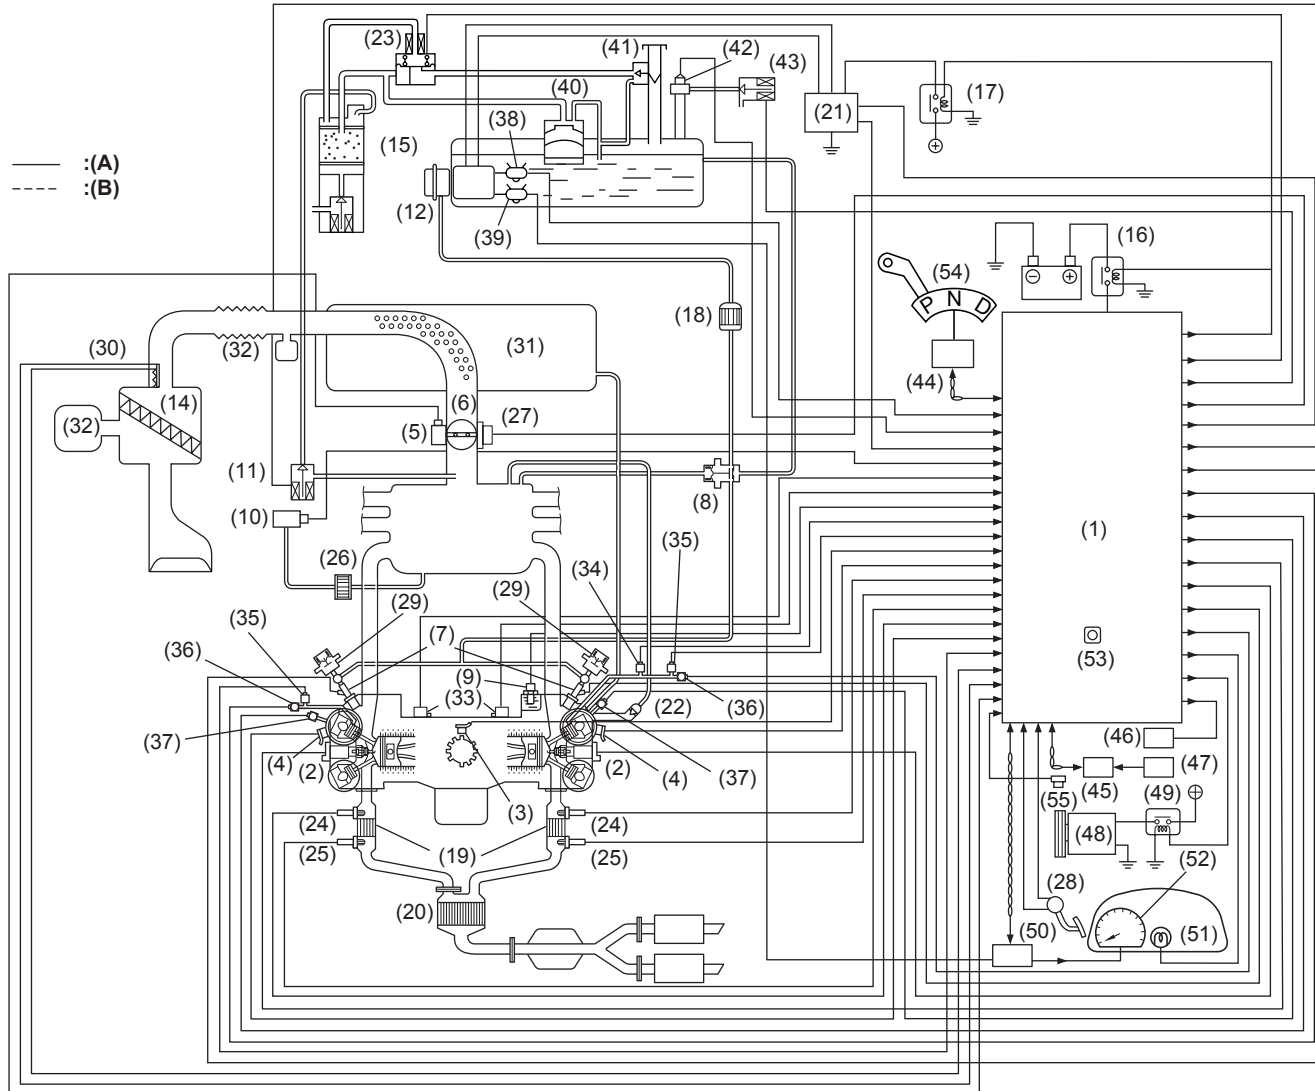

EMISSION CONTROL (AUX. EMISSION CONTROL DEVICES)

Item		Main components	Function	
Crankcase emission control system		Positive crankcase ventilation (PCV) valve	Draws blow-by gas into intake manifold from crankcase and burn it together with air-fuel mixture. Amount of blow-by gas to be drawn in is controlled by intake manifold pressure.	
Exhaust emission control system	Catalytic converter	Front	Catalytic converter	Oxidizes HC and CO contained in exhaust gases as well as reducing NOx.
		Rear		
	Air/fuel (A/F) control system		Engine control module (ECM)	Receives input signals from various sensors, compares signals with stored data, and emits a signal for optimal control of air-fuel mixture ratio.
			Front oxygen (A/F) sensor	Detects density of oxygen contained exhaust gases.
			Rear oxygen sensor	Detects density of oxygen contained in exhaust gases.
			Throttle position sensor	Detects throttle opening.
			Manifold absolute pressure sensor	Detects absolute pressure of intake manifold.
			Mass air flow and intake air temperature sensor	Detects amount of intake air.
				Detects the amount of intake air temperature inside the air cleaner case.
	Ignition control system		ECM	Receives various signals, compares signals with basic data stored in memory, and emits a signal for optimal control of ignition timing.
			Crankshaft position sensor	Detects engine speed (revolution).
			Camshaft position sensor	Detects reference signal for combustion cylinder discrimination.
			Engine coolant temperature sensor	Detects coolant temperature.
Knock sensor			Detects engine knocking.	
Evaporative emission control system		Canister	Absorbs evaporative gas that accumulates in fuel tank when engine stops, and releases it to combustion chambers for a complete burn when the engine is started. This prevents HC from being discharged into atmosphere.	
		Purge control solenoid valve	Receives a signal from ECM and controls purge of evaporative gas absorbed by canister.	
		Pressure control solenoid valve	Receives a signal from ECM and controls evaporative gas pressure in fuel tank.	
On-board refueling vapor recovery (ORVR) system		Vent valve	Opens a valve during refueling to let fuel vapor in the fuel tank flow to the canister. The system also closes the port to the canister when the fuel tank is full of fuel.	
		Drain valve	Closes the evaporation line by receiving a signal from ECM to check the evaporation gas leak.

EC(H6DO)-6

CATALYTIC CONVERTER

EMISSION CONTROL (AUX. EMISSION CONTROL DEVICES)

4. Catalytic Converter

- The basic materials of the three-way catalytic converter are platinum (Pt), rhodium (Rh) and palladium (Pd), and a thin coat of their mixture is applied onto honeycomb or porous ceramics of an oval or round shape (carrier). To avoid damaging the catalytic converter, only unleaded gasoline should be used.
- The catalytic converter reduces HC, CO and NO_x in exhaust gases through chemical reactions (oxidation and reduction). These harmful components are reduced most efficiently when their concentrations are in a certain balance. These concentrations vary with the air-fuel ratio. The ideal air-fuel ratio for reduction of these components is the stoichiometric ratio.
- Therefore, the air-fuel ratio needs to be controlled to around the stoichiometric ratio to purify the exhaust gases most efficiently.

AIR/FUEL (A/F) CONTROL SYSTEM

EMISSION CONTROL (AUX. EMISSION CONTROL DEVICES)

5. Air/fuel (A/F) Control System

- The air/fuel (A/F) control system makes a correction to the basic fuel injection duration in accordance with the signals from the front oxygen (A/F) sensor so that the stoichiometric ratio is maintained, thus ensuring most effective exhaust gas purification by the three-way catalytic converter. Different basic fuel injection durations are preset for various engine speeds and loads, as well as the amount of intake air.
- This system also has a learning control function which stores the corrected data in relation to the basic fuel injection in the memory map. This allows an appropriate air-fuel ratio correction to be added automatically in quick response to any situation that requires such an effect. Thus, the air-fuel ratio is optimally maintained under various conditions while purifying exhaust gases most effectively, improving driving performance and compensating for changes in sensors' performance over time.

AIR/FUEL (A/F) CONTROL SYSTEM

EMISSION CONTROL (AUX. EMISSION CONTROL DEVICES)

MEMO

EC(H6DO)-9

IGNITION CONTROL SYSTEM

EMISSION CONTROL (AUX. EMISSION CONTROL DEVICES)

6. Ignition Control System

- The ignition system is controlled by the ECM. The ECM monitors the operating condition of the engine using the signals from the sensors and switches shown below and determines the ignition timing most appropriate for each engine operating condition. Then it sends a signal to the igniter, commanding generation of a spark at that timing.
- The ECM uses a preprogrammed map for a “closed-loop” control which provides its ignition timing control with excellent transient characteristics, i.e., highly responsive ignition timing control.

EVAPORATIVE EMISSION CONTROL SYSTEM

EMISSION CONTROL (AUX. EMISSION CONTROL DEVICES)

7. Evaporative Emission Control System

A: GENERAL

- The evaporative emission control system prevents fuel vapors from escaping into atmosphere. This system includes a canister, purge control solenoid valve, fuel cut valve, and the lines connecting them.
- Fuel vapor in the fuel tank is introduced into the canister through the evaporation line, and are absorbed by activated carbon in it. The fuel cut valve is also incorporated in the fuel tank line.
- The purge control solenoid valve is controlled optimally by the ECM according to the engine condition.
- The pressure control solenoid valve incorporated in the fuel tank evaporation line regulates the pressure/vacuum in the fuel tank under the control of the ECM which uses the signal from the fuel tank pressure sensor.

- | | | |
|----------------------------------|-------------------------------------|-------------------------------------|
| (1) Fuel gauge | (7) Pressure control solenoid valve | (13) Fuel tank |
| (2) Intake manifold | (8) Drain valve | (14) Fuel cut valve |

| (5) Engine control module (ECM) | (11) Fuel temperature sensor | (17) Fuel tank sensor control valve |
| (6) Canister | (12) Fuel level sensor | |

B: FUEL CUT VALVE

The fuel cut valve is incorporated in the fuel tank. The rising level of the fuel in the fuel tank causes the float to move up and close the cap hole so that no fuel can enter the evaporation line.

EVAPORATIVE EMISSION CONTROL SYSTEM

EMISSION CONTROL (AUX. EMISSION CONTROL DEVICES)

C: FUEL TANK CAP

- The fuel tank cap is of a quick lock type and can be opened or closed in 1/4 of a full turn.
- The fuel tank cap has a relief valve, which prevents development of vacuum in the fuel tank in the event of a problem with the fuel vapor line.
- When there is no problem with the fuel vapor line, the filler pipe is sealed at the portion (A) and by the seal pressed against the filler pipe end. If vacuum develops in the fuel tank, the atmospheric pressure forces the spring down to open the valve; consequently outside air flows into the fuel tank, thus controlling the inside pressure.

EC-02109

(1) Seal
(2) Spring

(3) Valve
(4) Filter

EVAPORATIVE EMISSION CONTROL SYSTEM

EMISSION CONTROL (AUX. EMISSION CONTROL DEVICES)

D: CANISTER

The canister incorporates a drain valve and a drain filter.

The charcoal filled in the canister temporarily stores fuel vapors. When the purge control solenoid valve is opened by a signal from the ECM, the external fresh air entering the canister carries the fuel vapors into the collector chamber.

The drain filter is installed at the air inlet port of the drain valve. It cleans the air taken in the canister through the drain valve.

EVAPORATIVE EMISSION CONTROL SYSTEM

EMISSION CONTROL (AUX. EMISSION CONTROL DEVICES)

F: PRESSURE CONTROL SOLENOID VALVE

The fuel tank pressure control solenoid valve is located in the evaporation line between the shut-off valve on fuel filler pipe and the fuel tank. It adjusts the fuel tank inside pressure under the control of the ECM.

When the tank inside pressure becomes higher than the atmospheric pressure, the valve is opened allowing fuel vapors to be introduced into the canister.

On the other hand, when the tank inside pressure becomes lower than the atmospheric pressure, external air is taken from the drain valve into the canister.

EC-00026

| (4) Diaphragm | |
| (5) Valve | |

G: VENT VALVE

The vent valve is located inside of the fuel tank. During filling the fuel tank, fuel vapors are introduced into the canister through the vent valve.

When the fuel vapor pressure becomes higher than the atmospheric pressure and overcomes the spring force which is applied to the back side of the diaphragm, the port toward the canister is opened. The vent valve also has a float which rises and block the port toward the canister when the fuel is full.

EVAPORATIVE EMISSION CONTROL SYSTEM

EMISSION CONTROL (AUX. EMISSION CONTROL DEVICES)

ON-BOARD REFUELING VAPOR RECOVERY (ORVR) SYSTEM
EMISSION CONTROL (AUX. EMISSION CONTROL DEVICES)

8. On-board Refueling Vapor Recovery (ORVR) System

A: GENERAL

The on-board refueling vapor recovery system allows the fuel vapors in the fuel tank to be introduced directly into the canister through the vent valve when the fuel tank inside pressure increases as a result of refueling.

The diagnosis of the system is performed by monitoring the fuel tank inside pressure data from the fuel tank pressure sensor while forcibly closing the drain valve.

B: OPERATION

- While driving

Since the back side of the diaphragm in the pressure control solenoid valve is open to the atmosphere, the diaphragm is held pressed by the atmospheric pressure in the position where only the external air is introduced into the canister. When the fuel vapor pressure acting on the other side of the diaphragm increases and overcomes the atmospheric pressure, it pushes the diaphragm and opens the port through which the fuel vapors make their way to the canister.

EC-02103

| (3) Purge control solenoid valve | |

ON-BOARD REFUELING VAPOR RECOVERY (ORVR) SYSTEM

EMISSION CONTROL (AUX. EMISSION CONTROL DEVICES)

- While refueling

As the fuel enters the fuel tank, the tank inside pressure increases. When the inside pressure becomes higher than the atmospheric pressure, the port of the vent valve opens, allowing the fuel vapors to be introduced into the canister through the vent line. The fuel vapors are absorbed by charcoal in the canister, so the air discharged from the drain valve contains no fuel. When a filler gun is inserted, the shut-off valve closes the evaporation line.

IN(H6DO)-2

GENERAL

MECHANICAL

1. General

The H6 engine is of a horizontally opposed, six-cylinder design. This four-stroke-cycle, water-cooled, DOHC engine uses a total of 24 valves and its main components are made of aluminum alloy. It is fueled by a multiple fuel injection system.

The engine's major structural and functional features are as follows:

- A maintenance-free, chain-and-sprocket type camshaft drive mechanism is used which also contributes to reduction in the overall length of the engine.
- The cylinder block is an aluminum die-casting fitted with iron die-cast cylinder liners.
- Lightweight and compact design.

The cylinder bore pitch is 98.4 mm (3.874 in), which is much shorter than 113 mm (4.45 in) of the H4 engine.

The cylinder bore and piston stroke dimensions have been selected optimally for sufficient output and reduced size of the engine; they are 89.2 mm (3.512 in) and 80.0 mm (3.150 in) in contrast to 92.0 mm (3.622 in) and 75.0 mm (2.953 in) of the H4 engine.

The cylinder block is of a "siamese-triplet" design with the three cylinders of each bank cast without coolant passages between cylinders, while ensuring adequate cooling by employing an open-deck design.

The right bank camshafts and the left bank camshafts are driven by different timing chains, whereas the accessories are driven through their own pulleys by a single serpentine belt (two belts were used in the previous model's engine).

- Quiet operation

Unlike V6 engines, horizontally opposed six-cylinder engines do not generate secondary vibration (which is caused by primary operational vibration in a V6 engine and has a frequency twice as large as that of the primary vibration) although V6 engines have space saving merit. In addition to this inherent quietness provided by complete dynamic balance, the H6 engine incorporates the following quietly operating considerations:

The crankshaft is supported by seven bearings.

The chains driving the camshafts are provided with hydraulic tension adjusters and covered by a chain cover at the front of the engine.

An aluminum die-cast oil pan upper reinforces the joint of the right and left cylinder block banks, while giving additional rigidity to the crankshaft bearing areas.

The engine is connected to the transmission more rigidity than with the H4 engine by using 11 bolts (eight bolts in the H4 engine).

TIMING CHAINS

MECHANICAL

2. Timing Chains

• Two timing chains are used to drive the camshafts, one each for driving the two camshafts on each bank. Every camshaft is fitted with a sprocket through which it is driven by the corresponding timing chain. The left bank timing chain transmits the power from the crankshaft sprocket directly to the left bank camshaft sprockets, whereas the right bank timing chain transmits the crankshaft power via the lower idler sprocket which is driven by the left bank timing chain. (The lower idler gear has two tooth rows; the left bank timing chain engages with the inner row teeth and the right bank chain engages with the outer row teeth.) By this way, the right and left bank camshafts rotate in synchronization with each other.

The left bank timing chain also drives the water pump.

• The hydro-mechanical automatic chain tension adjuster provided for each chain constantly maintains the specified chain tension necessary to properly drive the camshafts, as well as to provide this chain and sprocket camshaft drive mechanism with a “maintenance-free” feature.

AUTOMATIC CHAIN TENSION ADJUSTER

MECHANICAL

3. Automatic Chain Tension Adjuster

The right and left bank timing chains are provided with their own tensioners. The tensioners are of a hydro-mechanical type that utilizes the engine oil pressure and can automatically keep the tension of the chains at a proper level without need for manual adjustments.

The tensioner case has an oil port that aligns with the oil port in the cylinder block when it is installed in position. The inside of the tensioner case is a high-pressure hydraulic chamber with a check ball. The pressure of the oil in the chamber is adjusted by the relief valve. Featuring a plunger with external screw threads, the tensioner can keep the chain taut constantly even when the engine is stationary.

ME-00609

- (1) Tensioner case
- (2) Spring
- (3) Plunger

- (4) Spring
- (5) Adjuster rod
- (6) Plunger case

TIMING CHAIN CASE

MECHANICAL

4. Timing Chain Case

- The timing chain case is formed by the front chain cover and rear chain cover, both made of aluminum die-casting. This two-piece chain case design helps reduce noise.
- Sealing materials used between the engine block and rear chain cover are an O-ring, metal gasket, and liquid gasket. Between the front and rear chain covers, liquid gasket is used to prevent oil from leaking out.
- A fluorocarbon resin oil seal is used at the crankshaft opening in the front chain cover.

ME-02080

- (1) Front chain cover
- (2) Rear chain cover

ME(H6DO)-5

CAMSHAFT

MECHANICAL

5. Camshaft

- The camshafts are of a composite material type using sintered steel for cam lobes and carbon steel for pipe part.

The sintered steel cams are very high in the resistance to wear, which enables the cam lift to be increased. In addition, use of the sintered steel cams contributes to reduction in weight.

- Each camshaft is supported at its four journals by the corresponding bearings. The front-most bearing has flanges on its both ends to receive thrust loads that are generated during movement of the camshaft.
- The bearings are lubricated by the oil that enters the passage in each camshaft from the port at the front-end journal and flows out through the hole in each journal.
- The intake camshaft has at its rear end a flange, which is used as an angle sensing wheel by the camshaft position sensor.
- As the engine is equipped with a variable valve lift system, each of the intake camshafts have high-lift cams and low-lift cams.

ME(H6DO)-7

CYLINDER HEAD

MECHANICAL

6. Cylinder Head

- The cylinder heads are made of aluminum alloy, which features light weight and high cooling efficiency.
- Each cylinder head incorporates a DOHC mechanism, which is adapted to the four valves per cylinder arrangement. A variable valve lift system is used at the intake port. The exhaust ports are formed in three independent ports. These design features contribute together to higher output.
- The combustion chamber is of a compact pent roof design with the spark plug located at its top center. The squish area formed between the piston top surface and combustion chamber helps improve mixing of air and fuel and thus combustion efficiency.
- Coolant flows from the rear to the front of the cylinder head of each bank. This serial-flow coolant line arrangement ensures highly efficient cooling of the engine.
- A metal gasket is used between the cylinder head and cylinder block. Tightening the cylinder head bolts by the angle-tightening method ensures invariable sealing performance of this gasket.

- (1) Intake port
- (2) Intake valve
- (3) Exhaust valve

- (4) Exhaust port
- (5) Combustion chamber

ME(H6DO)-8

7. Cylinder Block

- The cylinder block of this horizontally-opposed-cylinder engine is made of aluminum die-casting. It is split into right and left halves at its center where the crankshaft is supported. The cylinder liners are made of cast iron and are embedded as integral part of the cylinder block body during the casting process.
- The coolant passages of the right and left banks are independent of each other (parallel-flow type). The water jackets around the cylinder liners are open at the cylinder head side end of each bank (open-deck design).
- The cylinder block supports the crankshafts journals through seven main bearings rigidly and quietly. The #7 bearing is a flanged thrust bearing which controls the crankshafts end play.
- Rigid engine-to-transmission connection is ensured by 11 bolts (three more bolts than with the H4 engine).
- The aluminum die-cast oil pan upper located below the cylinder block reinforces connection between the cylinder block banks and its special form provides a baffle effect to suppress large fluctuation of oil level. In addition, the oil pan upper constitutes part of the oil and cooling circuits as well as the water pump volute chamber and thermostat chamber.

VARIABLE VALVE TIMING SYSTEM

MECHANICAL

10.Variable Valve Timing System

Regarding the construction and operation of the variable valve timing system, refer to ME (H4DOTC) section, Variable Valve Timing System. <Ref. to ME(H4DOTC) section, Variable Valve Timing System.>

11. Variable Valve Lift System

The engine is provided with a variable valve lift system. The variable valve lift system optimizes the intake valve lift by switching to use low lift cams or high lift cams in accordance with engine speed.

- In response to the signals from the ECM, the oil switching solenoid valve operates to switch the valve lift.
- At low engine speeds, the lift is reduced to increase intake air speed and to obtain effective combustion and higher torque output. The lift of the two valves are different from each other. By differentiating the intake air volume in this way, a swirl occurs in the combustion chamber and combustion is improved.
- At high engine speeds, the lift is increased to reduce intake resistance and to obtain higher power.
- To protect the engine, the system does not allow racing up the engine to high speeds in P or N range.

GENERAL

COOLING

1. General

- The engine cooling system consists of a down-flow radiator featuring high heat-dissipation performance, an electric-motor-driven fan, a water pump, a thermostat, and an engine coolant temperature sensor.
- The reservoir tank is designed to eliminate the need for replenishing coolant.
- The ECM controls the operation of the radiator main fan and sub fan depending on the signals from the engine coolant temperature sensor, vehicle speed sensor, A/C switch and A/C mid pressure switch.

2. Cooling Circuits

The cooling system operates in three different phases depending on the temperature of the engine coolant.

- 1st phase (thermostat closed)

When the engine coolant temperature is below 80°C (176°F), the thermostat remains closed. The coolant flows through the bypass and heater circuits.

This permits the engine to warm up quickly.

- 2nd phase (thermostat open)

When the engine coolant temperature is above 80 — 84°C (176 — 183.2°F), the thermostat opens. The coolant flows through the radiator where it is cooled.

- 3rd phase (thermostat open and radiator fan operating)

When the engine coolant temperature sensor sends a signal indicating a temperature above 91°C (196°F) to the ECM, it causes the radiator fan (or fans) to operate.

GENERAL

LUBRICATION

1. General

- The lubrication system forcibly circulates engine oil throughout the engine using an oil pump. The oil pressure is regulated by the relief valve.
- The oil pump is a thin, large-diameter trochoid rotor type which can accommodate the engine's high output. The pump is directly driven by the crankshaft.
- The engine oil is cleaned by a full-flow, paper element type oil filter. The filter has a bypass valve, which allows the engine oil to flow bypassing the filter if it is clogged.
- The engine oil discharged from the oil pump is delivered to the journal bearings, connecting rod bearings, and other parts requiring lubrication and cooling via an oil passage, oil filter, and oil galleries.
- The engine oil is also distributed to each cylinder head valve mechanism at a proper flow rate achieved by metering by the orifice provided in each cylinder head oil gallery.

2. Timing Chains

• Two timing chains are used to drive the camshafts, one each for driving the two camshafts on each bank. Every camshaft is fitted with a sprocket through which it is driven by the corresponding timing chain. The left bank timing chain transmits the power from the crankshaft sprocket directly to the left bank camshaft sprockets, whereas the right bank timing chain transmits the crankshaft power via the lower idler sprocket which is driven by the left bank timing chain. (The lower idler gear has two tooth rows; the left bank timing chain engages with the inner row teeth and the right bank chain engages with the outer row teeth.) By this way, the right and left bank camshafts rotate in synchronization with each other.

The left bank timing chain also drives the water pump.

• The hydro-mechanical automatic chain tension adjuster provided for each chain constantly maintains the specified chain tension necessary to properly drive the camshafts, as well as to provide this chain and sprocket camshaft drive mechanism with a “maintenance-free” feature.

AUTOMATIC CHAIN TENSION ADJUSTER

MECHANICAL

3. Automatic Chain Tension Adjuster

The right and left bank timing chains are provided with their own tensioners. The tensioners are of a hydro-mechanical type that utilizes the engine oil pressure and can automatically keep the tension of the chains at a proper level without need for manual adjustments.

The tensioner case has an oil port that aligns with the oil port in the cylinder block when it is installed in position. The inside of the tensioner case is a high-pressure hydraulic chamber with a check ball. The pressure of the oil in the chamber is adjusted by the relief valve. Featuring a plunger with external screw threads, the tensioner can keep the chain taut constantly even when the engine is stationary.

TIMING CHAIN CASE

MECHANICAL

4. Timing Chain Case

- The timing chain case is formed by the front chain cover and rear chain cover, both made of aluminum die-casting. This two-piece chain case design helps reduce noise.
- Sealing materials used between the engine block and rear chain cover are an O-ring, metal gasket, and liquid gasket. Between the front and rear chain covers, liquid gasket is used to prevent oil from leaking out.
- A fluorocarbon resin oil seal is used at the crankshaft opening in the front chain cover.

ME-02080

- (1) Front chain cover
- (2) Rear chain cover

ME(H6DO)-5

CAMSHAFT

MECHANICAL

5. Camshaft

- The camshafts are of a composite material type using sintered steel for cam lobes and carbon steel for pipe part.

The sintered steel cams are very high in the resistance to wear, which enables the cam lift to be increased. In addition, use of the sintered steel cams contributes to reduction in weight.

- Each camshaft is supported at its four journals by the corresponding bearings. The front-most bearing has flanges on its both ends to receive thrust loads that are generated during movement of the camshaft.
- The bearings are lubricated by the oil that enters the passage in each camshaft from the port at the front-end journal and flows out through the hole in each journal.
- The intake camshaft has at its rear end a flange, which is used as an angle sensing wheel by the camshaft position sensor.
- As the engine is equipped with a variable valve lift system, each of the intake camshafts have high-lift cams and low-lift cams.

CYLINDER HEAD

MECHANICAL

6. Cylinder Head

- The cylinder heads are made of aluminum alloy, which features light weight and high cooling efficiency.
- Each cylinder head incorporates a DOHC mechanism, which is adapted to the four valves per cylinder arrangement. A variable valve lift system is used at the intake port. The exhaust ports are formed in three independent ports. These design features contribute together to higher output.
- The combustion chamber is of a compact pent roof design with the spark plug located at its top center. The squish area formed between the piston top surface and combustion chamber helps improve mixing of air and fuel and thus combustion efficiency.
- Coolant flows from the rear to the front of the cylinder head of each bank. This serial-flow coolant line arrangement ensures highly efficient cooling of the engine.
- A metal gasket is used between the cylinder head and cylinder block. Tightening the cylinder head bolts by the angle-tightening method ensures invariable sealing performance of this gasket.

GENERAL

COOLING

1. General

- The engine cooling system consists of a down-flow radiator featuring high heat-dissipation performance, an electric-motor-driven fan, a water pump, a thermostat, and an engine coolant temperature sensor.
- The reservoir tank is designed to eliminate the need for replenishing coolant.
- The ECM controls the operation of the radiator main fan and sub fan depending on the signals from the engine coolant temperature sensor, vehicle speed sensor, A/C switch and A/C mid pressure switch.

2. Cooling Circuits

The cooling system operates in three different phases depending on the temperature of the engine coolant.

- 1st phase (thermostat closed)

When the engine coolant temperature is below 80°C (176°F), the thermostat remains closed. The coolant flows through the bypass and heater circuits.

This permits the engine to warm up quickly.

- 2nd phase (thermostat open)

When the engine coolant temperature is above 80 — 84°C (176 — 183.2°F), the thermostat opens. The coolant flows through the radiator where it is cooled.

- 3rd phase (thermostat open and radiator fan operating)

When the engine coolant temperature sensor sends a signal indicating a temperature above 91°C (196°F) to the ECM, it causes the radiator fan (or fans) to operate.

3. Oil Pump and Relief Valve

- The oil pump is a thin, large-diameter trochoid roller pump directly driven by the crankshaft. Its outer rotor and inner rotor are assembled with each other inside the rotor housing which is formed in the rear chain cover. The rotor housing is closed by the oil pump cover. The oil pump cover is made of aluminum die-casting and the outer rotor and inner rotor are made of sintered metal.

- When the pump discharge pressure exceeds a certain level, the relief valve opens and allows excess oil to return to the inlet of the pump. Two relief valves are installed; one in the oil pump cover and one in the oil pan upper.

|---------------|--------------------|
| (1) Contact | (4) Molded portion |
| (2) Diaphragm | (5) Terminal |
| (3) Spring | |

1) When oil pressure does not build up (immediately after ignition switch is turned ON):
The diaphragm is pushed toward the oil pan upper by the spring force (a force equivalent to the specified oil pressure). This closes the contact points, causing the oil pressure warning light in the combination meter to illuminate.

2) When oil pressure reaches the specified value (after engine starts):
After reaching the specified value of 14.7 kPa (0.15 kgf/cm², 2.1 psi), the oil pressure pushes the diaphragm against the spring force. This opens the contact points and the oil pressure warning light goes out.

- (8) Rod

GENERAL

MANUAL TRANSMISSION AND DIFFERENTIAL

1. General

The manual transmission is of a full-time all-wheel-drive design integrating a transmission assembly, front differential, and transfer gear assembly with center differential into a single unit. The transmission has five forward speeds and one reverse speed, and all gears are provided with inertia lock type synchronizers.

The transmission and front differential are housed in an aluminum case, which is split into right and left halves and constitutes also a clutch housing. Located at the rear and joined each other are the transfer case and extension case which house the transfer gears and center differential as well as part of the transmission assembly.

The major features of the transmission are as follows:

- The forward speed gears are helical gears featuring high tooth face strength, large tooth contact areas, and quiet operation.
- Reversing rotation is achieved by making a slidable reverse idler gear engage with both the reverse drive gear on the main shaft and the reverse driven gear integral with the 1st-2nd synchronizer hub on the drive pinion shaft.
- The center differential compensates for the difference in front and rear axle speeds. It consists of a bevel gear set and a viscous coupling located at its rear end, which are housed in a single case. The center differential, together with a pair of transfer gears, transmits the power from the transmission to the drive pinion shaft (front wheel drive shaft) and the propeller shaft. The viscous coupling functions as a differential-action-limiting element.

GEARSHIFT MECHANISM

MANUAL TRANSMISSION AND DIFFERENTIAL

2. Gearshift Mechanism

A: CONSTRUCTION

- Helical gears are used for forward speed gears. Reverse speed is achieved by making the drive gear to mesh with the main shaft while making the driven gear and reverse idler gear to mesh with the 1st-2nd synchronizer sleeve of the drive pinion, in order to reverse the rotating direction.
- The synchromesh mechanism for 1st and 2nd speeds are placed at the drive pinion side, while the mechanism for 3rd, 4th, 5th and reverse speeds are placed at the main shaft side.
- On non-turbo models, a double cone synchromesh mechanism is used for 2nd and 3rd speed gears.
- On turbo models, a double cone synchromesh mechanism is used for 1st, 2nd and 3rd speed gears.

REVERSE CHECK MECHANISM

MANUAL TRANSMISSION AND DIFFERENTIAL

3. Reverse Check Mechanism

Located in the transfer case, the reverse check mechanism prevents a direct 5th-to-reverse shift by using a selector arm and cam combination, which allows the gear to be shifted into the reverse only after it has been returned once to neutral.

A: CONSTRUCTION

The construction of the reverse check mechanism is as shown in the drawing on the opposing page. The reverse check sleeve is bolted to the transfer case and houses the mechanism main components.

The reverse accent shaft is slidable inside the reverse check sleeve and its smaller-diameter end is fitted with the reverse check cam. The cam can rotate and move axially on the shaft but its leftward movement is restricted by a step formed on the sleeve inner wall.

The reverse accent shaft has hollows in both ends. In the left end hollow are the 1st return spring and its cap and in the right end hollow is the reverse return spring, which pushes the shaft leftward.

Around the check cam is the reverse check spring whose left end applies simultaneous leftward and rotational forces to the cam.

Both the reverse check spring and reverse return spring are retained at their right ends by the reverse check plate which is held in place by the snap ring.

The reverse accent shaft has a V-groove in which the detent ball is pressed by the reverse accent spring fitted through the hole in the reverse check sleeve.

The reverse check sleeve and reverse accent shaft have a slot and a notch at their bottoms, respectively, and the selector arm is inserted in the notch through the slot.

REVERSE CHECK MECHANISM

MANUAL TRANSMISSION AND DIFFERENTIAL

B: OPERATION

The drawing below shows the state of the reverse check mechanism when the selector arm is in the neutral position. The 1st and 2nd gears will be selected if the selector arm is moved leftward from this point to a stop and then turned in either way. A rightward movement of the arm to a stop will enable selection of the 5th and reverse gears. In the neutral position, the selector arm receives a rightward force (force toward the 5th and reverse gear side) from the 1st return spring and a leftward force (force toward the 1st and 2nd gear side) from the reverse return spring to stay in that position.

The following explanation describes how the selector arm and reverse check mechanism operate when the driver selects the 5th gear and then selects the reverse gear.

- (1) 1st return spring
- (2) Reverse check sleeve

- (3) Reverse accent shaft
- (4) Reverse return spring

- (5) 5th and reverse gear side
- (6) 1st and 2nd gear side

REVERSE CHECK MECHANISM

MANUAL TRANSMISSION AND DIFFERENTIAL

1. WHEN SELECTOR ARM IS MOVED TOWARD 5TH AND REVERSE GEAR SIDE

The selector arm moves rightward while pushing both the reverse accent shaft and reverse check cam simultaneously.

(2) Reverse accent shaft

(3) Reverse check cam
(4) Selector arm

(5) Neutral position

REVERSE CHECK MECHANISM

MANUAL TRANSMISSION AND DIFFERENTIAL

2. WHEN SHIFT IS MADE TO 5TH GEAR

The selector arm is turned toward the 5th gear selection direction. When the arm clears the edge of the reverse check cam as it turns, the cam becomes free of the selector arm pressure and returns to its original position by the force of the reverse check spring.

(1) Reverse check sleeve
(2) Reverse accent shaft

(3) Reverse check cam
(4) Selector arm

(5) Reverse check spring

MT-00324

REVERSE CHECK MECHANISM

MANUAL TRANSMISSION AND DIFFERENTIAL

3. WHEN A SHIFT FROM 5TH TO REVERSE IS ATTEMPTED

The selector arm turns toward the reverse gear while pushing the reverse accent shaft rightward and the reverse check cam counterclockwise (as viewed in the direction of arrows A).

The reverse check cam, however, stops to rotate at a point where its stopper hits against the reverse check plate (this point corresponds to the neutral position in terms of the angle) and prevents the selector arm from moving toward the reverse gear selection direction. The selector arm is then axially pushed to the neutral position by the reverse accent shaft, which is given a leftward force by the reverse return spring.

- (1) Reverse check sleeve
- (2) Reverse accent shaft

- (3) Reverse check cam
- (4) Selector arm

CENTER DIFFERENTIAL

MANUAL TRANSMISSION AND DIFFERENTIAL

4. Center Differential

A: CONSTRUCTION

The center differential consists of a set of bevel gears and a viscous coupling.

The center differential has the following two functions: distributing the engine torque to the front and rear wheel drive shafts and absorbing the difference in rotating speed between the front and rear wheels.

The engine torque enters the center differential case from the transmission's driven shaft. The engine torque is then distributed through the bevel gear set directly to the drive pinion shaft and via the transfer drive and driven gears to the rear drive shaft.

The viscous coupling limits the differential action of the bevel gear set when either front or rear wheels spin so that adequate torques are transmitted to the front and rear wheels and proper traction is obtained.

| (2) Transfer drive gear | (5) Drive pinion shaft |
| (3) Viscous coupling | (6) Drive shaft |

CENTER DIFFERENTIAL

MANUAL TRANSMISSION AND DIFFERENTIAL

B: MECHANISM OF VISCOUS COUPLING

The viscous coupling consists of a number of alternately arranged inner and outer plates and air-and-silicone oil mixture filled into a sealed space that is formed by the center differential case and the rear side gear of the differential gear set. The inner plates have their inner perimeters splined to the side gear and the outer plates have their outer perimeters splined to the center differential case. The outer plates are held apart by spacer rings. There are no spacer rings between the inner rings, so the inner rings are movable slightly in axial directions. X-section rings are used to prevent leakage of silicone oil, which would otherwise occur if the oil is pressurized due to large difference in front and rear axle speeds.

- (1) X-section ring
- (2) O-ring
- (3) Spacer ring
- (4) Outer plate

- (5) Inner plate
- (6) X-section ring
- (7) Side gear (rear)

CENTER DIFFERENTIAL

MANUAL TRANSMISSION AND DIFFERENTIAL

1. TORQUE CHARACTERISTICS

When a speed difference occurs between the center differential case and the rear side gear, a shear force is generated in the silicone oil placed between the outer and inner plates. The torque is then transmitted by the silicone oil between the center differential case and the rear side gear.

The greater the speed difference, the greater the shear force generated in the silicone oil. The relationship between the torque transmission and the speed difference is shown in the figure below. As can be seen from the figure, the smaller the speed difference, the smaller the torque transmission and the differential action.

- (A) Driving torque
- (B) Speed difference

2. HUMP PHENOMENON

Silicone oil is heated and expanded as differential action continues. The oil in the viscous coupling expands and compresses the inside air to cause direct plate-to-plate contact or a non-viscous operation to occur; this phenomenon is called hump.

The hump eliminates the rotating speed difference between the center differential case and the rear side gear (or locks the differential), so soon after it has occurred, the internal pressure and temperature drop. The viscous coupling then returns to the normal shear torque transmitting operation. (The hump phenomenon does not occur under normal operating conditions.)

CENTER DIFFERENTIAL

MANUAL TRANSMISSION AND DIFFERENTIAL

C: FUNCTION

When there is no speed difference between the front and rear wheels, the center differential delivers the engine torque to the front and rear wheels at a ratio of 50:50.

When a rotating speed difference occurs between the front and rear wheels, the center differential operates to absorb it in a controlled way by the function of the viscous coupling.

1. DURING NORMAL DRIVING

During straight-line driving on a flat road at a constant speed, all the four wheels rotate at the same speed. The center differential delivers engine torque evenly to the front and rear wheels. The viscous coupling does not generate shear torque because there is no relative movements between the inner and outer plates.

MT-00330

(1) Engine torque

(A) To front differential

(B) To rear differential

CENTER DIFFERENTIAL

MANUAL TRANSMISSION AND DIFFERENTIAL

2. DURING TURNS AT LOW SPEEDS

During turns at low speeds, rotating speed difference occurs between the front and rear wheels, as well as between the left and right wheels. More particularly, the front wheels rotate faster than the rear wheels. The center differential then acts to absorb the speed difference to enable smooth driving.

Although the speed difference is small under this condition, operation of the viscous coupling causes more torque to be transmitted to the rear than to the front.

MT-00331

CENTER DIFFERENTIAL

MANUAL TRANSMISSION AND DIFFERENTIAL

3. DRIVING ON ROUGH OR SLIPPERY ROADS

- When front wheels are on a slippery surface

When the front wheels begin to spin, the resulting speed difference between the front and rear drive shafts causes the viscous coupling to generate significant amount of shear torque. As a result, the torque distributed to the rear wheels becomes much larger than that distributed to the spinning front wheels. The traction and driving stability are thus ensured on a rough or slippery road.

MT-00332

- When rear wheels are on a slippery surface

When the vehicle is accelerated quickly from a standing start with the rear wheels on a slippery surface, the distribution of the vehicle weight on the front and rear wheels changes and the rear wheels start spinning. Due to the resulting speed difference between the front and rear drive shafts, the viscous coupling generates a significant amount of shear torque, now in the direction opposite to that generated when the front wheels are on a slippery surface. As a result, the torque distributed to the front wheels becomes much larger than that distributed to the rear wheels.

5. Transmission Mounting

MT-00334

(1) Pitching stopper

(2) Cushion rubber

(3) Cross member

2. Clutch

- The clutch is a push type clutch. When the pedal is depressed, the self-aligning release bearing is caused to slide on a guide pressing the center of the diaphragm spring. The diaphragm spring is warped and the force having pressed the pressure plate is released, causing the flywheel, clutch disk and pressure plate to be disengaged from each other, and the transmission of drive force is interrupted. The action point of the clutch is located at the tip of each diaphragm spring fingers, which press the pressure plate against the clutch disc.
- A clutch using a diaphragm spring has the advantage of little variation in push load even when the clutch disc is worn. The diaphragm spring is located inside the clutch cover.
- The clutch disk for both of the non-turbo and turbo models has damper springs and is placed in between the flywheel and the pressure plate.
- Inside the clutch cover, the diaphragm spring and pressure plate are combined with each other by means of strap plates, which also serve to prevent the pressure plate from relatively turning.
- The clutch control is hydraulic and the master cylinder is of the conventional type. The cylinder diameter of the master cylinder for turbo models are made larger. Also, on both the non-turbo and turbo models, the pedal depressing effort is optimized and a damper is attached to reduce vibration of the clutch pedal.

GENERAL

CLUTCH

1. General

- The clutch is of a dry, single plate type with a diaphragm spring.
- The clutch is a push type clutch. When the pedal is depressed, the release bearing will press the center of the diaphragm spring to disengage the contact between the pressure plate and clutch.
- The clutch control is hydraulic and operates the release lever using the hydraulic pressure generated in the master cylinder when the pedal is depressed.
- A conventional type flywheel is used on non-turbo models, while a dual mass type flywheel is used on turbo models.
- The clutch start system enables the driver to start the engine only when the clutch pedal is fully depressed.

FLYWHEEL

CLUTCH

3. Flywheel

A: GENERAL

1. NON-TURBO MODELS

The flywheel is directly connected to the crankshaft. The mass of the flywheel absorbs the fluctuations in crankshaft rotation, and the flywheel transmits the engine torque to the clutch disc.

2. TURBO MODELS

- The flywheel is of a dual mass type, which consists of a primary flywheel, damper spring, ring gear, planetary gears, and a secondary flywheel.
- The damper spring is attached to the periphery of the primary flywheel.
- The engine power flows from the primary flywheel through the damper spring, ring gear and planetary gears to the secondary flywheel, and then is transmitted to the transmission via the clutch. Torque fluctuation in this power train is dampened by lowering the rigidity of the power train using a two piece flywheel with a damper spring, ring gear and planetary gears in between, which helps reduce vibration and noise from the power unit.

SELECT LEVER

CONTROL SYSTEM

1. Select Lever

- The automatic transmission select lever can be moved to any of the 4 ranges and the transmission enters sports mode when the lever is moved laterally from D range, and further switches to sports shift mode (manual mode) when the lever is moved forward (“+” direction) or rearward (“-” direction).
- The select lever makes shift direction (longitudinal) movements as well as select direction (lateral) movements. The select lever is guided by a gate to make these movements.
- In the sports shift mode, the transmission upshifts when the selector lever is moved forward (“+” direction) and downshifts when the lever is moved rearward (“-” direction).
- To transmit movements of the select lever to the transmission, a select cable is used.
- The select lever mechanism has a detent spring. It ensures more precise positioning of the select lever.

2. Shift Lock and Key Interlock System

A: GENERAL

To increase safety during standing start, the shift lock system prevents movement of the select lever from the "P" position to any other position unless the brake pedal is depressed. This system is also provided with a key interlock function which prevents removal of the ignition key from the key cylinder unless the selector lever is placed in the "P" position.

SHIFT LOCK AND KEY INTERLOCK SYSTEM

CONTROL SYSTEM

B: SHIFT LOCK SYSTEM OPERATION

The shift lock system has a solenoid-operated plunger (1). With the select lever in the P position, the plunger remains extended, holding the lock arm (2) in its pushed out (locking) position. When the brake pedal is depressed with the ignition switch in either the ON or START position, the solenoid is energized and the plunger is retracted. This causes the lock arm to lift to the select lever release position. The select lever now can be moved to any other position. The P position of the select lever is detected by the inhibitor switch (3).

- (2) Lock arm
- (3) Inhibitor switch
- (4) 4AT
- (5) 5AT

CS-00541

SHIFT LOCK AND KEY INTERLOCK SYSTEM

CONTROL SYSTEM

C: KEY INTERLOCK FUNCTION

• When the select lever is at any position other than P, the solenoid is energized and its guide pin extends to hold the lock pin in its pushed out position. Held in its extended position, the lock pin interferes with the stopper portion of the rotator which turns together with the ignition key. Thus, the ignition key cannot be rotated to the "LOCK" position.

| (3) START position | (8) Guide pin |
| (4) LOCK position | (9) Key cylinder |
| (5) Lock pin | |

SHIFT LOCK AND KEY INTERLOCK SYSTEM

CONTROL SYSTEM

- When the select lever is moved to “P”, the “P” position switch in the select lever assembly operates, deenergizing the solenoid. As the push force of the guide pin is removed, the return spring moves the lock pin toward the solenoid and the lock pin becomes clear of the rotator stopper. Then the key can be rotated to the LOCK position and removed from the ignition switch.

OIL PUMP

AUTOMATIC TRANSMISSION

1. Oil Pump

A: CONSTRUCTION

The pump consists of a parashoid rotor pair, a housing and a cover. The inner rotor has nine teeth and the outer rotor has ten teeth.

|----------------------|-----------------|--------------------|
| (1) Oil pump housing | (4) Gasket | (7) Oil pump cover |
| (2) Hose | (5) Inner rotor | (8) Seal ring |
| (3) Nipple | (6) Outer rotor | (9) Thrust bearing |

B: FUNCTION

- The pump draws automatic transmission fluid (ATF) from the oil pan through the oil strainer located under the control valve assembly. The ATF then flows through a passage in the transmission case, and after passing through the oil pump housing and oil pump cover, it enters the suction port.
- As the inner rotor rotates, the outer rotor also rotates. This motion causes the ATF to be sucked up through the suction port and discharged from the discharge port.
- The discharged ATF flows through a passage in the oil pump cover and then a passage in the oil pump housing. It then goes through a passage in the transmission case to the control valve assembly, from which the ATF is directed to various clutches, brakes, and torque converter lockup clutch for acting as hydraulic fluid and lubricating oil. Part of the ATF also flows to the manual valve, from where it is distributed to the circuit corresponding to the range selected by the selector lever.
- As engine speed increases, the delivery rate of the oil pump also increases.

AUTOMATIC TRANSMISSION

2. WHEN REVERSE IS NOT SELECTED

When the select lever is in any position other than reverse, no pressure is applied to the reverse clutch piston. Hence the drive and driven plates are separated from each other, transmitting no power to any element beyond them.

A check ball is built into the clutch piston. This check ball has a function of releasing the pressure which may build up in the fluid remaining behind the piston by centrifugal force generated by the idly rotating high clutch drum, thereby avoiding a half-engaged state of the clutch.

HIGH CLUTCH

AUTOMATIC TRANSMISSION

3. High Clutch

When the 3rd or 4th gear is selected, hydraulic pressure is applied to the high clutch from the shift valve and pressure regulator valve. The clutch drive and driven plates are pressed together, thus transmitting the engine power from the input shaft to the front planetary carrier through the high clutch hub.

A cover is placed inside the piston, and the space between the piston and the cover is filled with ATF. When the high clutch is not in engagement, the centrifugal force generated in the ATF inside the cover cancels out the centrifugal force generated in the ATF remaining behind the high clutch piston, thus preventing incomplete disengagement of the clutch.

2-4 BRAKE

AUTOMATIC TRANSMISSION

4. 2-4 Brake

A: CONSTRUCTION

The 2-4 brake consists of a 2-4 brake piston retainer, 2-4 brake piston, return spring, pressure plate, drive plates, driven plates, and a snap ring that fits in a housing formed in the transmission case.

This brake is engaged by the hydraulic pressure from the control valve and locks the front sun gear when the 2nd or 4th gear is selected.

- (13) Needle bearing
- (14) Snap ring
- (15) One-way clutch
- (16) Snap ring

LOW CLUTCH

AUTOMATIC TRANSMISSION

B: FUNCTION

The low clutch operates in the 1st, 2nd and 3rd speed gears.

This clutch engages when hydraulic pressure from the control valve is applied to the low clutch piston, transmitting power through the rear planetary carrier to the reduction drive shaft.

A cover is placed inside the piston, and the space between the piston and the cover is filled with ATF. When the low clutch is not in engagement, the centrifugal force generated in the ATF inside the cover cancels out the centrifugal force generated in the ATF remaining behind the low clutch piston, thus preventing incomplete disengagement of the clutch.

- (2) Low clutch piston

- (3) Return spring
- (4) Cover

REDUCTION GEAR

AUTOMATIC TRANSMISSION

7. Reduction Gear

A: GENERAL

Engine output is transmitted from the rear planetary carrier to the reduction drive shaft and the reduction drive gear. Power to the front wheels is then transmitted through the reduction driven gear and drive pinion to the front final gears and front wheels. Power to the rear wheels is transmitted sequentially from the transfer clutch hub through the transfer clutch, rear drive shaft, propeller shaft, and rear differential to the rear wheels.

| (1) Seal ring | (4) Transfer clutch hub | (7) Reduction drive shaft |
| (2) Ball bearing | (5) Reduction driven gear | (8) Drive pinion shaft |
| (3) Reduction drive gear | (6) Ball bearing | |

8. Control Valve

The hydraulic control system of the automatic transmission consists of an oil pump, valve bodies containing valves, clutches, fluid passages and pipes. The operation of the system is controlled by driver's manual inputs and electrical inputs from the TCM.

A: CONSTRUCTION

The structure of the control valve is simplified by disusing the accumulator and decreasing the number of mechanical valves. This allowed a two-layered body structure, which contributes to minimizing the size and weight. Also, the transfer hydraulic control mechanism is contained in the control valve.

Oil pressure from the duty solenoid for each clutch will be directly applied to the clutch/brake without flowing through an accumulator, therefore the engagement/disengagement control range is widened and the response during gear shift is improved.

GEAR TRAIN

AUTOMATIC TRANSMISSION

9. Gear Train

A: CONSTRUCTION

The gear train consists of two sets of planetary gears, three sets of multi-plate clutches, two sets of multi-plate brakes and one set of one-way clutch.

AT-02305

GEAR TRAIN

AUTOMATIC TRANSMISSION

2. N RANGE

Since the rear sun gear and the high clutch drum are in mesh with the input shaft, they rotate together with the input shaft.

The high clutch drum does not transmit the torque to the planetary unit since the reverse clutch and the high clutch are not engaged.

The torque of the rear sun gear is transmitted to the rear internal gear through the pinion gear.

However, the torque of the rear sun gear is not transmitted to the rear planetary carrier since the low clutch is disengaged and, therefore, the rear internal gear is freewheeling.

As a result, the torque of the input shaft is not transmitted to the reduction drive shaft.

GEAR TRAIN

AUTOMATIC TRANSMISSION

4. 1st GEAR OF D RANGE OR MANUAL MODE (BELOW SET SPEED) (D₁)

When the 1st gear is selected in the D range or in manual mode (below set speed), only the low clutch is engaged. In this state, the rear internal gear attempts to rotate counterclockwise but it is impossible by the action of the one-way clutch which locks the internal gear to the transmission case. As a result, rotation of the rear sun gear causes the pinion gears to rotate around the sun gear. This causes the planetary carrier to rotate. In this way, rotation of the input shaft is transmitted to the reduction drive shaft, after being subjected to speed reduction by the planetary gear train.

On the other hand, the rear internal gear rotates clockwise if the reverse driving force is applied to it by the reduction drive shaft during coasting. This clockwise rotation of the internal gear causes the one-way clutch to freewheel. Since the power path between the reduction drive shaft and the input shaft is lost as a result, no engine braking effect is available.

| (6) Low & reverse brake | (12) Rear pinion gear | |

GEAR TRAIN

AUTOMATIC TRANSMISSION

5. 2nd GEAR

When the 2nd gear is selected, the 2-4 brake and the low clutch are engaged. The front sun gear is now locked to the transmission case due to engagement of the 2-4 brake. In this state, the torque of the rear sun gear is transmitted to the rear internal gear through the path of the front internal gear, front pinion gears, low clutch drum and low clutch. At this time, the one-way clutch is freewheeling since the low clutch drum is rotating clockwise.

In this power flow configuration, the rear pinion gears are rotated by the rear internal gear at a speed faster than that available from the configuration for the 1st gear, so the rotation speed of the reduction drive shaft is higher than that of the 1st gear.

Since the drive power is transmitted without passing through the one-way clutch in the 2nd gear, the backward driving force from the wheels is transmitted through the reduction drive shaft to the input shaft; this makes the engine braking effect available.

| (7) One-way clutch | (14) Front internal gear | |

GEAR TRAIN

AUTOMATIC TRANSMISSION

6. 3rd GEAR

When the 3rd gear is selected, the low clutch and the high clutch are engaged. The engaged high clutch rotates through its drum the front planetary carrier, and rotation of the carrier is transmitted to the rear internal gear through the engaged low clutch. In this power flow configuration, the rear sun gear and the rear internal gear rotate at the same speed since the rear pinion gears are solid on their axes and the whole planetary gear train rotates as a unit at the same speed as its sun gear. As a result, the input shaft and the reduction drive shaft rotate at the same speed.

In the 3rd gear, the one-way clutch is freewheeling because the low clutch is rotating clockwise. Since the drive power is transmitted without passing through the one-way clutch, the backward driving force from the wheels is transmitted through the reduction drive shaft to the input shaft; this makes the engine braking effect available.

GEAR TRAIN

AUTOMATIC TRANSMISSION

MEMO

GEAR TRAIN

AUTOMATIC TRANSMISSION

7. 4th GEAR

When the 4th gear is selected, the high clutch and the 2-4 brake are engaged. The engaged high clutch causes the front planetary carrier to rotate, whereas the engaged 2-4 brake causes the front sun gear to be locked to the transmission case.

The front planetary carrier rotates at the same speed as the input shaft. The rotation of the front planetary carrier causes the front pinion gears to revolve around the stationary front sun gear, which causes the front internal gear to rotate faster than the input shaft.

As a result, the reduction drive shaft is driven at a higher speed than the input shaft.

In the 4th gear, the one-way clutch is freewheeling because the low clutch is rotating clockwise. Since the drive power is transmitted without passing through the one-way clutch, the backward driving force from the wheels is transmitted through the reduction drive shaft to the input shaft; this makes the engine braking effect available.

GEAR TRAIN

AUTOMATIC TRANSMISSION

8. 1st SPEED GEAR OF MANUAL MODE (OVER SET SPEED)

When the 1st gear is selected in manual mode (over set speed), both the low clutch and the low & reverse brake are engaged. Although the power flow configuration is the same as that with the 1st gear in the D range, the one-way clutch produces no freewheeling effect because the low & reverse brake is locking the rear internal gear always to the transmission case.

During coasting, therefore, the backward driving force from the wheels is transmitted through the reduction drive gear to the input shaft. This means, unlike the 1st gear in D range, that the engine braking effect is available in this range.

4AT-31

GEAR TRAIN

AUTOMATIC TRANSMISSION

9. R RANGE

When the select lever is placed in the R position, the reverse clutch and the low & reverse brake are engaged. The reverse clutch allows the input shaft torque to be transmitted to the front sun gear, while the low & reverse brake allows the low clutch drum to be interlocked with the transmission case.

The rotation of the front sun gear causes the front pinion gear to rotate in the opposite direction and therefore the front internal gear rotates in the same direction.

At this time, the rotation speed transmitted to the front internal gear is reduced through gearing between the front sun gear and the front pinion gears.

The one-way clutch produces no freewheeling effect because the low & reverse brake is in engagement.

In this range, since the power transmission is made without passing through the one-way clutch, the driving force from the wheels is transmitted through the reduction drive shaft to the input shaft; this makes the engine braking effect available.

AWD TRANSFER SYSTEM

AUTOMATIC TRANSMISSION

10.AWD Transfer System

A: GENERAL

This all-wheel-drive (AWD) transfer system uses a hydraulic multi-plate type clutch. The clutch is controlled by the TCM through a control valve.

The TCM has in its memory a set of duty ratio data, each defining at what ratio the transfer clutch should transmit the torque for a particular driving condition. Based on the driving condition information it receives from the corresponding sensors (engine torque, vehicle speed, throttle opening, gear range, slip of wheels, etc.), the TCM selects an appropriate duty ratio from the memory and uses it to control the solenoid valve. The solenoid valve then regulates the pilot pressure of the transfer control valve, which creates the pressure to the clutch from the line pressure. The clutch is engaged to a degree determined by the transfer clutch pressure thus created. Through this process, the torque from the engine is distributed to the rear wheels optimally according to driving conditions.

B: CONSTRUCTION

The transfer clutch drum and rear drive shaft are joined to each other by welding. The rear drive shaft is provided with oil passages for transfer clutch control.

ELECTRO-HYDRAULIC CONTROL SYSTEM

AUTOMATIC TRANSMISSION

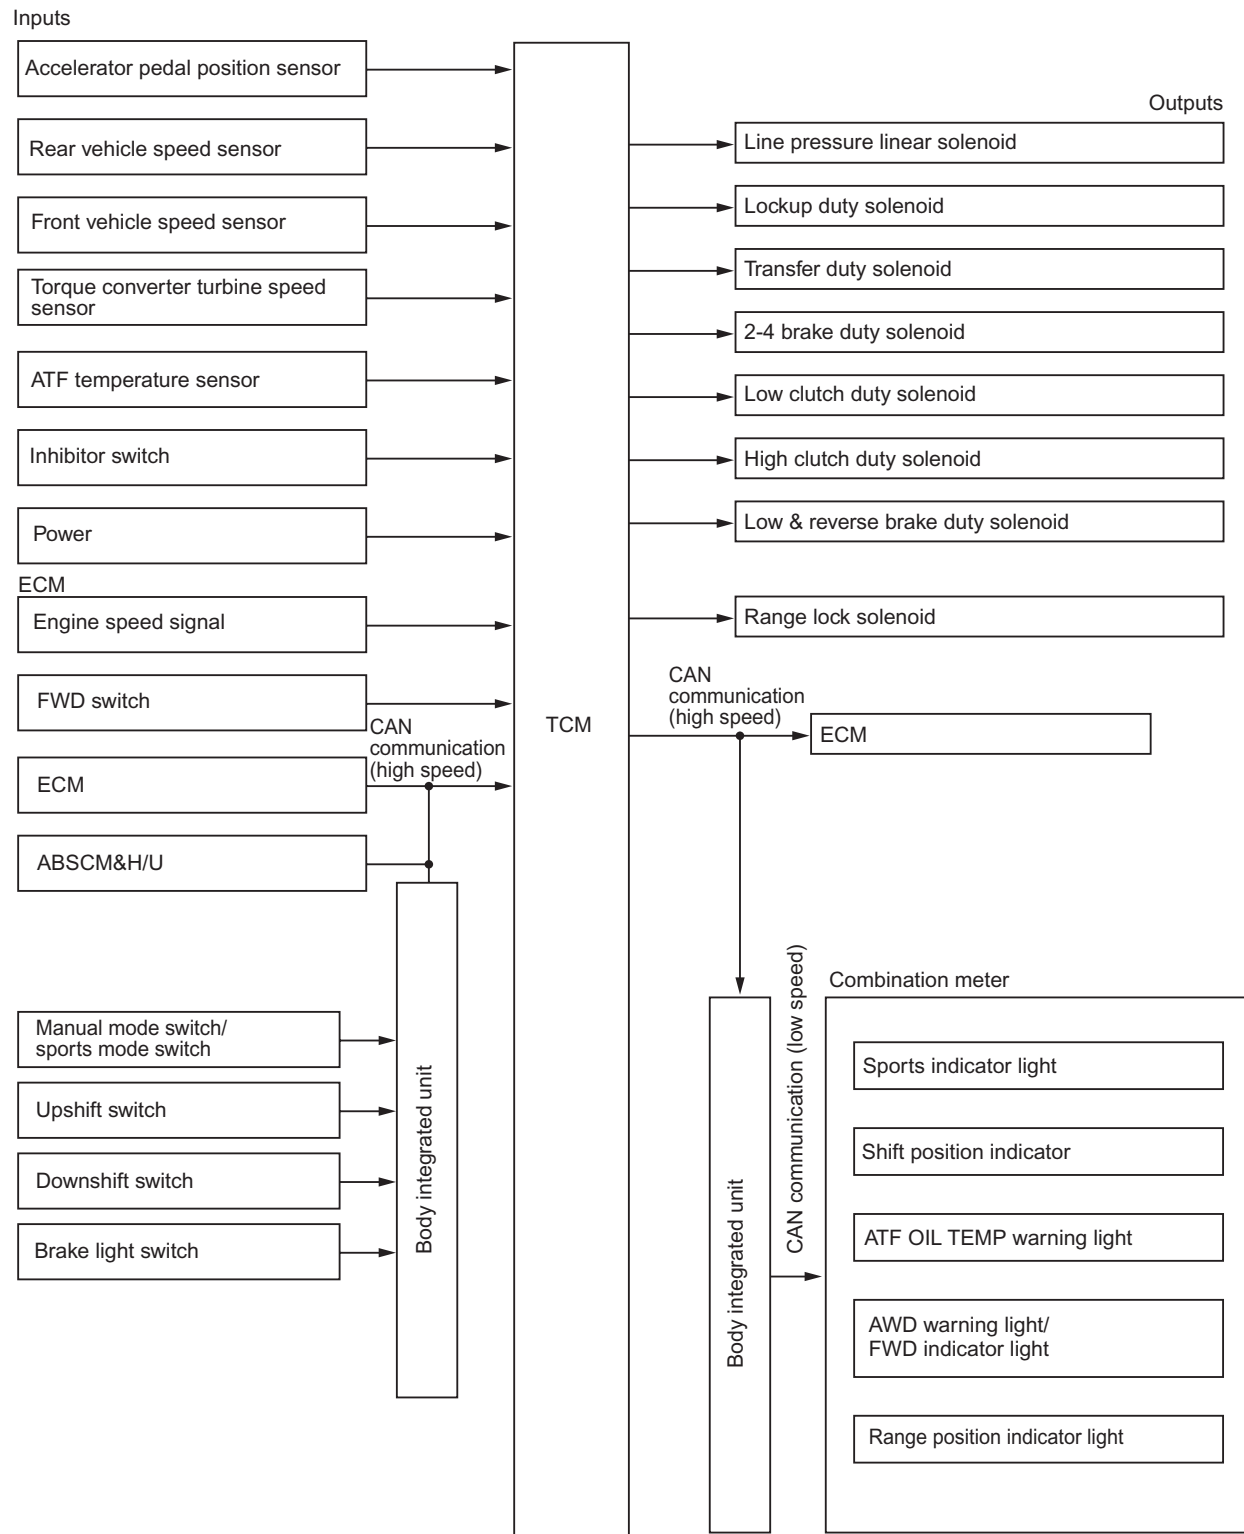

11. Electro-hydraulic Control System

A: GENERAL

The electro-hydraulic control system for the transmission and transfer consists of various sensors and switches, a transmission control module (TCM) and the control valves including solenoid valves. The system controls the automatic transmission operation, including gear shifting, lockup clutch operation, line pressure, pattern selection (NORMAL and SPORTS), and gear-shift timing. It also controls the operation of the transfer clutch. The TCM determines the vehicle's operating conditions from various input signals and controls a total of seven solenoids (line pressure linear solenoid, lockup duty solenoid, 2-4 brake duty solenoid, low clutch duty solenoid, high clutch duty solenoid, low & reverse duty solenoid, and transfer duty solenoid) by sending appropriate signals to them.

ELECTRO-HYDRAULIC CONTROL SYSTEM

AUTOMATIC TRANSMISSION

AT-02934

ELECTRO-HYDRAULIC CONTROL SYSTEM

AUTOMATIC TRANSMISSION

B: INPUT SIGNALS

Signal name	Major function
Accelerator pedal position sensor	Indicates the throttle opening. This signal is used to determine shift point, line pressure, and lockup engaging vehicle speed, which vary with engine load.
Front vehicle speed sensor (located on transmission case)	Indicates the vehicle speed. This signal is used for control of gear shifting, lockup engaging, line pressure, and transfer clutch operation.
Rear vehicle speed sensor (located on extension case)	Used to control transfer clutch, and also as backup signal in case of failure of front vehicle speed sensor.
Engine speed signal	Indicates the engine speed. This signal is used for control of lockup clutch to ensure smooth engagement.
Inhibitor switch	Used to determine gears and line pressures in each of ranges P, R, N, and D.
ATF temperature sensor	Indicates the ATF temperature. This signal is used for inhibition of lockup, release of OD and determination of ATF temperature.
FWD switch	Used for changing the mode from AWD to FWD. Also used for adapting the vehicle to FWD tester roller. Changeover from AWD to FWD can be made by inserting a fuse into the fuse holder.
Torque converter turbine speed sensor	Tells the rotation speed of the input shaft. The proportion of this speed to the vehicle speed determines whether shifting should be made or not.
CAN communication signals	Receives information from ECM, ABSCM and body integrated unit to control the transmission.

C: OUTPUT SIGNALS

Signal name	Function
Line pressure linear solenoid	Regulates the line pressure according to driving conditions.
Lockup duty solenoid	Regulates the hydraulic pressure of the lockup clutch to operate it in three modes (open, smooth and lockup).
Transfer duty solenoid	Regulates the hydraulic pressure of the transfer clutch to control the driving force to the rear drive shaft.
2-4 brake duty solenoid	Regulates 2-4 brake operating pressure to reduce shifting shocks.
High clutch duty solenoid	Regulates high clutch operating pressure to reduce shifting shocks.
Low clutch duty solenoid	Regulates low clutch operating pressure to reduce shifting shocks.
Low & reverse duty solenoid	Regulates low & reverse brake operating pressure to reduce shifting shocks.
Shift lock solenoid	Controls the shift lock solenoid during range lock control.
CAN communication signals	Outputs transmission information to control modules and the body integrated unit.

ELECTRO-HYDRAULIC CONTROL SYSTEM

AUTOMATIC TRANSMISSION

D: CONTROL ITEMS

Control items		Description of control	
Transmission control	Shifting control	Base shift control	Upshifting and downshifting are set for each range, gear and pattern according to the accelerator pedal position and vehicle speed.
		ABS-in-operation control	Gear speed is determined according to vehicle speed when ABS signal and brake signal is input.
		ATF low temperature control	Shifting into 4th gear is prevented when ATF temperature is below the preset value.
		Sports pattern control (SPORTS light ON)	Sports pattern is selected when the select lever is moved to the manual mode position.
		Base pattern control (SPORTS light OFF)	Base pattern is selected when the select lever is in D range.
	Lockup control	Base lockup control	Lockup control is performed according to throttle position and vehicle speed. (Basically lockup is OFF during gear shifting.)
		Smooth control	Smooth lockup is performed when lockup is switched on.
	Line pressure control	Ordinary control	Line pressure is regulated according to the accelerator pedal position and vehicle speed signals.
	Shift timing control	Gear speed control	Controls each solenoid.
		Lockup control	When shifting, the lockup clutch is temporarily released.
	Adaptive control	Accelerator pedal quick return control	When the accelerator pedal is quickly released from a depressed condition, the gear is held in the current speed.
		Accelerator pedal quick depressing control	When the accelerator pedal is quickly depressed, the transmission down shifts immediately.
		Map switch control	Switches the shift point setting according to the driving condition.
		Braking control	To ensure engine braking effect during braking and improve the re-acceleration performance, the transmission is downshifted in accordance with the deceleration.
	CAN communication signals control		Sends and receives vehicle information between control modules and controls each module.
AWD transfer clutch control	Ordinary transfer control		Transfer clutch pressure is regulated according to the throttle valve angle, vehicle speed, and engine torque.
	Slip control		Regulates transfer clutch pressure in accordance with the amount of slip.
	Turning control		Transfer clutch pressure is reduced after detecting a turn.
	ABS-in-operation control		Transfer clutch pressure is adjusted to a set level immediately after reception of ABS signal.

12.Sensor Systems

A: ACCELERATOR PEDAL POSITION SENSOR

The accelerator pedal position sensor provides electrical signals corresponding to accelerator pedal position. The throttle valve angular position and accelerator depressing speed are detected by this accelerator pedal position sensor.

B: REAR VEHICLE SPEED SENSOR

This vehicle speed sensor (output shaft speed sensor) is a Hall element type sensor and is externally mounted on the extension case. It detects the rear drive shaft speed in terms of the peripheral speed of the transfer clutch drum and sends pulse signals (30 pulses per rotation) to the TCM.

AT-01582

(1) Rear vehicle speed sensor

C: FRONT VEHICLE SPEED SENSOR

This vehicle speed sensor (output shaft speed sensor) is externally mounted on the transmission case. It detects the front drive pinion shaft speed and sends sine wave signals (16 pulses per rotation) to the TCM.

AT-01583

(1) Front vehicle speed sensor

SENSOR SYSTEMS

AUTOMATIC TRANSMISSION

D: ATF TEMPERATURE SENSOR

This sensor is integrated with the transmission harness and is mounted on the transmission control valve body. Its resistance varies in accordance with the ATF temperature. The characteristics of the sensor are as shown below.

AT-02348

(1) ATF temperature sensor

(A) Resistance

(B) Temperature

E: TORQUE CONVERTER TURBINE SPEED SENSOR

The torque converter turbine speed sensor (output shaft speed sensor) is externally mounted on the transmission case.

The sensor detects the torque converter turbine speed in terms of the rotation speed of the periphery of the high clutch drum coupled to the input shaft, and sends sine wave signals (32 pulses per rotation) to the TCM. The TCM converts this signal into turbine speed to use it for shifting control.

AT-00416

(1) Torque converter turbine speed sensor

F: INHIBITOR SWITCH

The inhibitor switch assures safety when starting the engine. This switch is mounted on the right side of the transmission case, and is operated by the selector lever.

When the selector lever is set to P or N, the electrical circuit in the inhibitor switch is connected to the starter circuit to enable cranking of the engine.

When the selector lever is in the R or D range, the electrical circuit in the inhibitor switch is disconnected. Hence engine cranking is disabled. In the R range, the backup light circuit is completed in the switch, and the backup lights come on.

In addition to the above function, the inhibitor switch incorporates a circuit for detecting the selected range position and sending the range signal to the TCM.

SENSOR SYSTEMS

AUTOMATIC TRANSMISSION

G: LINE PRESSURE LINEAR SOLENOID

This solenoid is mounted on the transmission control valve. This adjusts the line pressure in response to electrical current instructions from the TCM. The line pressure is regulated to an optimum level according to the driving condition.

AT-02341

(1) Line pressure linear solenoid 2

H: 2-4 BRAKE DUTY SOLENOID

This solenoid is mounted on the transmission control valve. This adjusts the pressure applied to the 2-4 brake in response to the duty instructions from the TCM. The engaging force of the 2-4 brake during shifting is properly controlled and shift shocks are reduced.

AT-02342

(1) 2-4 brake duty solenoid

I: LOCKUP DUTY SOLENOID

This solenoid is mounted on the transmission control valve. Its duty ratio is controlled by signals from the TCM. The solenoid provides smooth engagement and disengagement of the lockup clutch.

(1) Lockup duty solenoid

J: LOW CLUTCH DUTY SOLENOID

This solenoid is mounted on the transmission control valve. This adjusts the pressure applied to the low clutch in response to the duty instructions from the TCM. The engaging force of the low clutch during shifting is properly controlled and shift shocks are reduced.

(1) Low clutch duty solenoid

SENSOR SYSTEMS

AUTOMATIC TRANSMISSION

K: HIGH CLUTCH DUTY SOLENOID

This solenoid is mounted on the transmission control valve. This adjusts the pressure applied to the high clutch in response to the duty instructions from the TCM. The engaging force of the high clutch during shifting is properly controlled and shift shocks are reduced.

(1) High clutch duty solenoid

L: LOW & REVERSE BRAKE DUTY SOLENOID

This solenoid is mounted on the transmission control valve. This adjusts the pressure applied to the low & reverse brake in response to the duty instructions from the TCM. The engaging force of the low & reverse brake during shifting is properly controlled and shift shocks are reduced.

(1) Low & reverse brake duty solenoid

M: TRANSFER DUTY SOLENOID

This solenoid is mounted on the transmission control valve. This adjusts the pressure applied to the transfer in response to the duty instructions from the TCM. Torque distribution to the front and rear is controlled by properly controlling the engagement force of the transfer clutch.

AT-02347

(1) Transfer duty solenoid

TRANSMISSION CONTROL MODULE (TCM)

AUTOMATIC TRANSMISSION

13. Transmission Control Module (TCM)

The TCM receives various sensor signals and determines the running conditions of the vehicle. It then sends control signals to each solenoid according to the preset gearshift characteristic data, lockup operation data, and transfer clutch torque data (duty ratios).

A: CONTROL SYSTEM

Control items		Input signals
Shifting control	Ordinary shift control	Accelerator pedal position signal Rear vehicle speed signal Front vehicle speed signal Engine speed signal Range signal
	ABS-in-operation control	ABS signal Rear vehicle speed signal Front vehicle speed signal Brake switch signal

AT-02935

TRANSMISSION CONTROL MODULE (TCM)

AUTOMATIC TRANSMISSION

C: SHIFTING CONTROL

1. ORDINARY SHIFT CONTROL

The TCM controls each solenoid based on input signal information such as inhibitor switch signals, vehicle speed signals and accelerator pedal position signals, to automatically select the optimum gear position from the shifting map.

2. ENGINE COOPERATIVE CONTROL

During shifting, the TCM outputs a torque-down requirement signal, and the ECM receives this to retard the ignition timing of each cylinder to temporarily decrease the output torque from the engine. Simultaneously with this control, the TCM constantly monitors the shift sequence through vehicle speed sensors and the turbine speed sensor to perform feedback control and optimize gear shifts. Because of this control, a smooth and comfortable gear shifting is ensured under all conditions.

3. ABS COOPERATIVE CONTROL

When the ABS is operating, the optimum gear speed for the vehicle speed is selected by cooperative operation with the ABSCM to prevent degrading the operation of the ABS.

4. CONTROL AT HIGH OIL TEMPERATURES

If the ATF temperature becomes extremely high, shifting control is performed by automatically switching to a shifting map that is less likely to cause temperature rise.

5. CONTROL WHEN ATF OR ENGINE COOLANT TEMPERATURE IS LOW

When the ATF temperature or engine coolant temperature is extremely low at engine start, etc., shifting control is performed by automatically switching to a shifting map that causes temperature rise easier.

6. CONTROL WHEN CRUISE CONTROL IN OPERATION

When the cruise control is operating, shifting control is performed by automatically switching to a shifting map that is suitable for cruise control.

TRANSMISSION CONTROL MODULE (TCM)

AUTOMATIC TRANSMISSION

D: LOCKUP CONTROL

- The TCM has pre-programmed lockup clutch engagement and disengagement conditions for each gear and shift pattern. The engagement and disengagement conditions are defined in terms of the accelerator pedal position and vehicle speed.
- The TCM controls lockup clutch operation through duty solenoids.

1. NON-LOCKUP OPERATION

The duty solenoid allows the pilot pressure to be applied to the disengaging end of the valve in the control valve body. The valve then opens the clutch disengaging circuit port to add the lockup operating pressure (torque converter clutch regulating pressure) to the disengaging circuit. Moreover, the valve opens the lockup clutch engaging circuit port and allows the hydraulic fluid in the circuit to flow to the ATF cooler, thus lowering the pressure in the circuit. As a result, the lockup clutch is disengaged due to difference in pressure between both circuits.

This control is performed in all gear positions.

2. LOCKUP OPERATION

The duty solenoid allows the pilot pressure to be applied to the engaging end of the valve in the control valve body. The valve then opens the clutch engaging circuit port that communicates to the torque converters impeller chamber, allowing high pressure fluid to flow to the lockup clutch. The clutch then engages.

- The TCM controls the current to the duty solenoid by gradually changing the current. As a result, the valve also moves gradually, so the clutch engagement pressure increases smoothly. This causes the lockup clutch to become initially in a half-engaged state and then in a fully engaged state, thus preventing shock during engagement.

This control is performed in all gear positions.

E: LINE PRESSURE CONTROL

The oil pump discharge pressure (line pressure) is controlled by the line pressure linear solenoid and the line pressure is regulated to an optimum level corresponding to the vehicle's running conditions.

1. LINE-PRESSURE CONTROL DURING SHIFTING

The line pressure is controlled by the TCM as follows to meet varying operating conditions.

- The TCM receives throttle angle signals, and the TCM sends a control signal to the line pressure linear solenoid. The pressure from the line pressure linear solenoid is sent to the valve where the line pressure is regulated. The valve adjusts the oil-pump-generated line pressure to make the line pressure matched to the driving condition.

TRANSMISSION CONTROL MODULE (TCM)

AUTOMATIC TRANSMISSION

F: SHIFT PATTERN SELECTION CONTROL

1. ADAPTIVE CONTROL

This control is performed to improve the drivability of the vehicle by optimizing gear shifts in accordance with the driver's intention to accelerate or decelerate, and driving conditions such as hill climbing and descending, etc.

- Shift pattern automatic switching control

This control enables selection of the optimum gear speed by automatically switching the shift pattern by estimating driver's intentions and driving conditions through sensor information such as driving resistance, engine speed, acceleration, vehicle speed, and also from calculated values.

Any of the three patterns NORMAL, SPORTS, and SLOPE are continuously and automatically selected under the following conditions.

D range

NORMAL ↔ SPORTS ↔ SLOPE

D range, in sports mode

SPORTS ↔ SLOPE

Normal pattern: covers a wide range from normal driving to high speed driving.

Sports pattern: a shift pattern suitable for driving conditions requiring deep accelerator pedal positions, such as winding road driving.

Slope pattern: this shift pattern controls upshifting to prevent too frequent gear shifting during climbing or descending hills. By combining braking control (in sports mode only) (explained later), engine braking will be positively used when descending hills.

AT-00431

(1) Without climbing and descending control

(3) Brake pedal ON

(2) With climbing and descending control

(4) Re-acceleration

TRANSMISSION CONTROL MODULE (TCM)

AUTOMATIC TRANSMISSION

AT-00432

(A) Base pattern

(1) Accelerator pedal position

(B) Grade control pattern

(2) Vehicle speed

- Accelerator pedal quick depressing control

When the accelerator pedal is quickly depressed, the TCM interprets this as acceleration is required, and the transmission is downshifted earlier to obtain a greater drive force.

- Accelerator pedal quick return control

When the accelerator pedal is quickly released, the TCM interprets this as deceleration is required, and upshift is prohibited in order to hold the transmission in the current gear speed to prevent frequent shifting and to maintain engine braking effect (operates in sports mode only).

- Braking control

According to the braking force (deceleration) during braking, downshifts are hastened to ensure engine braking effect and obtain a larger driving power for accelerating after braking (operates in sports mode only).

2. SPORTS MODE CONTROL

When the shift lever is moved toward the manual gate side in D range, the SPORT light in the combination meter illuminates and the system enters the Sports mode. Gearshift timings are set at higher vehicle and engine speeds to make more use of low speed gears. The full lockup vehicle speed in 4th is also set higher than in the normal mode.

3. MANUAL MODE CONTROL

By operating the “+” or “-” switch on the select lever in D range with the sports shift switch ON (in sports mode), the system switches to manual mode. In this state, operating the “+” switch causes upshifting while operating the “-” switch causes downshifting; manual shifting is enabled and the selected gear position is held while driving.

However, at certain vehicle speeds or ATF temperatures, the following inhibiting control is performed.

- Upshift inhibiting and auto downshift control

The gear upshifts each time the “+” switch is operated, however, when the vehicle speed is too low

TRANSMISSION CONTROL MODULE (TCM)

AUTOMATIC TRANSMISSION

for the selected gear speed, the TCM inhibits further upshifting. If the vehicle speed becomes too slow for the current gear speed, a downshift will be made automatically to prevent engine stall. When the vehicle comes to a stop, the transmission will always be controlled to shift to 1st speed unless the vehicle was in Manual mode 2nd hold control.

- Downshift inhibiting control

The gear downshifts each time the “-” switch is operated, however, when the vehicle speed is too low for the selected gear speed, the TCM inhibits further shifting. A manual shifting inhibiting buzzer will sound to warn the driver.

- Engine over speed prevention control

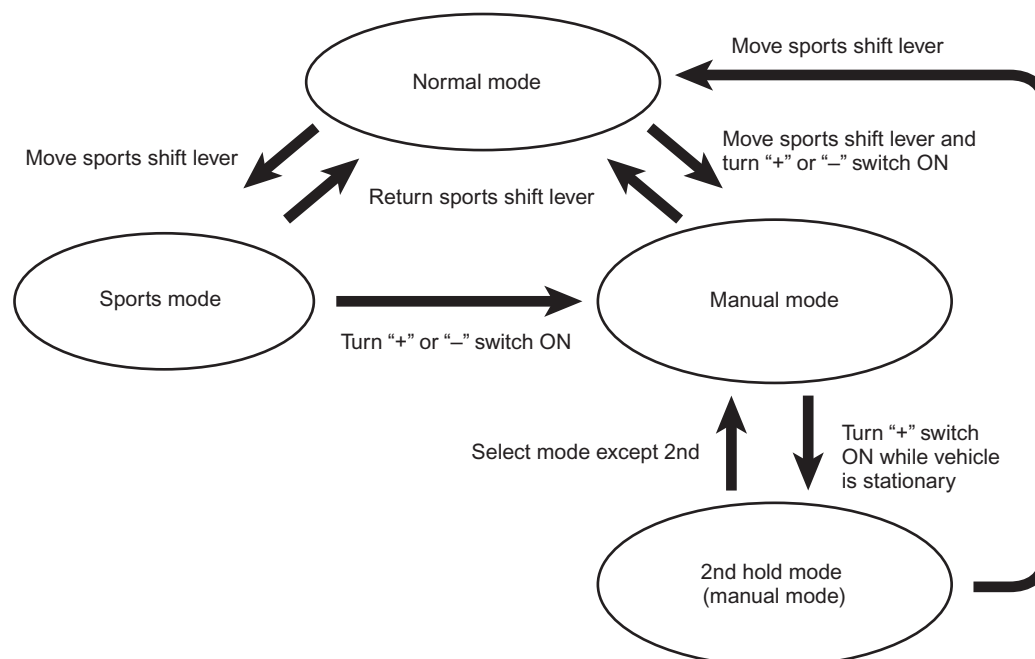

If the engine speed exceeds the preset value during accelerating, the fuel supply is cut to prevent over-revving of the engine.

- Control when the temperature is low or hot

When the ATF temperature is low as in cases such as immediately after start in winter, upshifting to 4th is inhibited to quicken warm up. Upshifting to 4th is also inhibited if the ATF temperature becomes extremely high after severe driving, to prevent further temperature rise.

4. 2nd HOLD CONTROL (IN MANUAL MODE)

When the “+” switch is operated when the vehicle is in Manual mode and not moving, the transmission shifts to 2nd speed enabling start in 2nd. This status is held unless the manual mode is canceled, or a speed other than 2nd is selected with the “-” switch. Also, the transmission is held in 2nd when the vehicle is stopped.

AT-02340

TRANSMISSION CONTROL MODULE (TCM)

AUTOMATIC TRANSMISSION

5. ILLUMINATION CONTROL OF VARIOUS INDICATORS

Illuminations of the various indicators on the combination meter are controlled in accordance with the shift pattern selection as shown below.

Indicator	D ●	SPORT	▲ ▼	1	Operation mode
Status	D ●	SPORT	▲ ▼	1	Operation mode
Normal D range	D ●	SPORT	△ ▽	(extinguished)	Normal mode
In sports mode	D ●	SPORT	△ ▽	(extinguished)	Sports mode
Manual shift mode	D ○	SPORT	▲ ▼	1 — 4	Manual mode

NOTE:
Indicators printed in solid black show their illuminated status.

AT-02881

TRANSMISSION CONTROL MODULE (TCM)

AUTOMATIC TRANSMISSION

G: LEARNING CONTROL OF SHIFTING HYDRAULIC PRESSURES

To constantly ensure excellent shift quality regardless of the variance between friction material and aging, learning control of shifting hydraulic pressures is used.

Learning takes place for every normal shifting under certain conditions, and the learned values are not lost even when the power is turned OFF (or battery's negative terminal disconnected).

H: RANGE LOCK CONTROL

This control prevents the select lever from being moved to the R position when the vehicle is running. Thus damage to components such as the reverse clutch is prevented.

When the specified speed is exceeded the TCM turns off the shift lock solenoid for the select lever. Therefore the range lock control works to inhibit operation from N range to R range, preventing the transmission from put into reverse.

TRANSMISSION CONTROL MODULE (TCM)

AUTOMATIC TRANSMISSION

I: CAN COMMUNICATION SIGNALS CONTROL

By interchanging information between control modules such as the TCM, ECM, ABSCM & H/U, etc., the modules are controlled in accordance with the vehicle's driving conditions.

In CAN (Controller Area Network) communication, each control module is connected with 2 lines and a large amount of information is interchanged through such a small number of wiring. Each control module sends and receives information and reads only the necessary information for its own purpose.

Main signals sent and received for transmission control

J: AWD TRANSFER CLUTCH CONTROL

● Basic control

Type of control	Regulates transfer clutch pressure in response to engine torque, throttle position and vehicle speed.
Gear position	1st thru 4th and reverse
Remarks	<p style="text-align: center;">AT-01761</p> <p>(1) Ordinary control (2) Transfer clutch capacity (3) Duty-ratio</p>

● Slip control

Type of control	Regulates transfer clutch pressure in accordance with the amount of slip.
Gear position	1st thru 4th and reverse
Remarks	Release: Released when the amount of slip becomes smaller than the specified value.

● Turning control

Type of control	Decreases transfer clutch pressure upon detection of a turn.
Gear position	1st thru 4th and reverse
Remarks	—

● ABS control

Type of control	Regulates to the specified transfer clutch pressure quickly when the ABS signal is input.
Gear position	1st thru 4th and reverse
Remarks	—

● P and N range control

Type of control	Regulates to the specified transfer clutch pressure immediately after a P or N range signal is input.
Gear position	P and N
Remarks	—

ON-BOARD DIAGNOSTICS SYSTEM

AUTOMATIC TRANSMISSION

14. On-board Diagnostics System

A: FUNCTION

The on-board diagnostics system detects and stores in the form of a code a fault that has occurred in any of the following input and output signal systems.

Rear vehicle speed sensor	High clutch duty solenoid	Sports shift switch
Front vehicle speed sensor	Low & reverse duty solenoid	Engine speed signal
Throttle position sensor	Transfer duty solenoid	Lockup clutch
Line pressure linear solenoid	ATF temperature sensor	Torque converter turbine speed sensor
2-4 brake duty solenoid	CAN communication signal circuit	1, 2, 3, 4, R gear ratios
Lockup duty solenoid	Inhibitor switch	Shift lock solenoid
Low clutch duty solenoid	Brake switch	

If a fault has been detected, the system tells the fault by causing the SPORT indicator light to blink.

B: OPERATION OF SPORT INDICATOR LIGHT

On starting the engine, the SPORT indicator light illuminates and then goes out as shown in the Normal diagram below. If any problem exists, the light continues flashing as shown in the Abnormal diagram below.

- (A) When normal
(B) When abnormal

- (1) Engine cranking
(2) After abnormality is detected
(3) 2 seconds
(4) 0.25 seconds

AT-02194

15.Fail-safe Function

The failsafe control function ensures minimum level of drivability even if a fault should occur in the vehicle speed sensors, accelerator pedal position sensor, inhibitor switch, or any of the solenoids.

- Front and rear vehicle speed sensors

A dual speed-sensing system is used. The speed signal is taken from the transmission (by the output shaft speed sensor). Even if one sensor system fails, the vehicle can be controlled normally with the other normally operating sensor system.

- Accelerator pedal position sensor

If the accelerator position sensor becomes faulty, control will be maintained by assuming that the accelerator pedal position is at a certain angle.

- Inhibitor switch

If the TCM receives different signals simultaneously from a faulty inhibitor switch, it selects a range in the following priority:

D > R > N > P

- Line pressure linear solenoid

If the line pressure linear solenoid system fails, the solenoid is de-energized and the line pressure is raised to the maximum to enable the vehicle to operate.

- Lockup duty solenoid

If the lockup duty solenoid system fails, the solenoid is de-energized and the lockup clutch is disengaged.

- Transfer duty solenoid

When the transfer duty solenoid system becomes faulty, it is de-energized. This causes oil pressure to the transfer clutch to be interrupted and no power is transmitted to the rear axle. (FWD state)

- 2-4 brake duty solenoid

If a fault occurs in the 2-4 brake duty solenoid system, the solenoid is de-energized and the gears are limited to the 2nd or 3rd.

- Low clutch duty solenoid

If a fault occurs in the low clutch duty solenoid system, the solenoid is de-energized and the gears are limited to the 3rd or 4th.

- High clutch duty solenoid

If a fault occurs in the high clutch duty solenoid system, the solenoid is de-energized and the gears are limited to the 2nd or 3rd.

- Torque converter turbine speed sensor

If a fault occurs in the torque converter turbine speed sensor, the gears are limited to the 3rd speed.

- Low & reverse duty solenoid

If a fault occurs in the low and reverse duty solenoid system, the solenoid is de-energized and the gears are limited to the 1st.

TRANSMISSION MOUNTING

AUTOMATIC TRANSMISSION

16. Transmission Mounting

A: GENERAL

The transmission mounting consists of a pitching stopper, cushion rubber, and a cross member.

In addition to support the transmission, these components absorb noise and vibration caused by the transmission.

AT-00438

- (1) Pitching stopper
- (2) Cushion rubber
- (3) Cross member

4AT-60

GENERAL

AUTOMATIC TRANSMISSION

1. General

To improve the dynamic performance and fuel efficiency of the vehicle, a new 5-speed automatic transmission is developed. The features of this new automatic transmission are as follows:

A: NEW CONSTRUCTION

- The planetary gears layout has been changed from the conventional 2-planetary to a 3-planetary arrangement.
- The construction of the torque converter has been changed to achieve a higher efficiency.
- The layout of the oil pump has been changed to reduce friction.
- The drive pinion gear has been changed.
- Major components are made of aluminum.

B: CHANGES FOR BETTER DRIVING PERFORMANCE

1. IMPROVED SHIFTING PERFORMANCE

- By using a wide ranged and crossed ratio gears, a high driving power is ensured at a wide vehicle speed range, and the torque differential between before and after shifting is minimized.
- By using a system that controls the clutch pressure directly and electronically (direct hydraulic control), an accurate and highly responsive control is achieved.
- By using a one-way clutch, smooth shifting without torque interruption is realized.
- By using a new adaptive control, the shifting map is automatically switched and a more active shifting control is performed in the manual mode.
- The control enables manual shifting by operating the steering switch to UP or DOWN while driving in D range, and returns to normal automatic shifting when certain conditions are met.
- To reduce gear noise from the reduction driven gear and prevent the bending moment of the drive pinion shaft from affecting the engagement of reduction gears, the front and rear ends are supported with bearings.
- To reduce driving noise, the drive shafts and joints are integrated and the transmission side drive axle shaft is abolished.

C: MODIFICATION MADE FOR BETTER FUEL EFFICIENCY

1. OPTIMIZED GEAR RATIO

- The wider gear ratio range obtained by five speeds contribute to better dynamic performance, while improving fuel efficiency at constant speed cruising by enabling use of lower engine speeds.

2. IMPROVED EFFICIENCY

- The efficiency of the torque converter has been increased.
- Friction in the oil pump and gear train are reduced.
- Drive pinion gear teeth are changed to uniform height teeth, and their offset amount is reduced.
- Ranges in which the transmission operates in slipping lockup and full lockup states are widened.

3. WEIGHT REDUCTION

- An aluminum bearing plate is used.
- The planetary carrier, clutch drum and the hub are made of aluminum.
- The wall thickness of the transmission case is reduced.

D: CONVENTIONAL MECHANISMS

- The transfer is provided with a VTD (Variable Torque Distribution) system which consists of a planetary gear type center differential and a hydraulic multi-plated LSD, to electronically control the differential operation and improve safety and drivability.

5AT-4

OIL PUMP

AUTOMATIC TRANSMISSION

3. Oil Pump

A: CONSTRUCTION

The pump consists of a inner-teeth type rotor, oil pump housing, and an oil pump cover. The inner rotor has nine teeth and the outer rotor has ten teeth.

- | | |
|-----------------------|---------------------------------------|
| (1) Oil pump cover | (6) Outer rotor |
| (2) Air breather hose | (7) Oil pump housing |
| (3) Nipple | (8) O-ring |
| (4) Stator shaft | (9) Straight pin |
| (5) Inner rotor | * : Parts that cannot be disassembled |

B: OPERATION

The inner rotor is connected to the engine crankshaft via a oil pump shaft, impeller side of the torque converter, and drive plate; when the inner rotor turns the outer rotor also turns.

Since the number of teeth on the inner rotor and outer rotor are not the same, a space is formed between the inner rotor and outer rotor and its capacity changes as the rotors turn. Oil is drawn in when the capacity is large and is compressed and discharged when the capacity becomes smaller.

FRONT BRAKE

AUTOMATIC TRANSMISSION

4. Front Brake

A: CONSTRUCTION

The front brake consists of a front brake piston, return spring, drive plates, driven plates, and a retaining plate.

This brake engages to lock the front sun gear when engine braking is used in the 1st, 2nd and 3rd speeds and in the 5th speed and reverse range.

5AT-8

HIGH AND LOW REVERSE CLUTCH

AUTOMATIC TRANSMISSION

7. High and Low Reverse Clutch

A: CONSTRUCTION

The high and low reverse clutch consists of a high and low reverse clutch piston, retainer spring, drive plate, driven plate, and a retaining plate.

This clutch engages to fix the mid sun gear with the rear sun gear in the 3rd, 4th and 5th speeds.

It also fix the mid sun gear and rear sun gear when engine braking is used in 1st speed.

In reverse, the mid sun gear and rear sun gear are connected.

(The high & low reverse clutch cannot be disassembled.)

13.AWD Transfer System

A: GENERAL

Used in the transfer is the VTD (Variable Torque Distribution) system which combines a compound planetary gear type center differential installed in the transfer case behind the transmission and a hydraulically operated multi-plate differential action limiting device (LSD) located between the output shafts of the center differential. Differential action limiting control is performed by the TCM according to driving and road surface conditions.

The input torque is transmitted to the 1st sun gear of the center differential through the intermediate shaft. From the 1st sun gear, the torque is transmitted through the 1st pinion to the output carrier in the front wheel output shaft, and through the 2nd pinion to the 2nd sun gear in the rear wheel output shaft.

The center differential performs the differential functions of absorbing the speed difference between the front and rear wheels and also distributes drive forces to the front and rear wheels at a predetermined ratio. In normal conditions (when pressure is not applied to the multi-plate clutch), the drive force distribution ratio is 45.7 % to the front wheels and 54.3 % to the rear wheels. The hydraulic multi-plate clutch connected in parallel with the center differential between the carrier and 2nd sun gear functions as a differential action limiting device (LSD) and also as a device that controls torque distribution according to driving conditions.

Differential action limiting control is performed as a “torque responsive control”, where control is based on the input torque to the transfer as calculated from the engine torque, torque converter characteristics, gear ratio, etc. The LSD clutch is controlled by the hydraulic pressure regulated by the transfer valve in the transmission hydraulic control valve assembly, as a result of the TCM directly controlling the linear solenoid. The torque distribution ratio to front and rear wheels changes from 45.7:54.3 to direct connection, in accordance with the hydraulic pressure acting on the piston.

The speed of the front and rear wheels determine the basic signals for the differential action limiting control. The rear wheel speed is detected by the sensor installed above the rear drive shaft, and the front wheel speed is detected by the sensor on the parking gear above the reduction gear.

AWD TRANSFER SYSTEM

AUTOMATIC TRANSMISSION

B: OPERATION

The front-rear torque distribution ratio is determined by the of center differential's compound planetary gears and is varied by changing the degree of engagement of the hydraulically operated multi-plate clutch that connects the center differential output elements according to driving conditions and road surface conditions. The torque distribution ratio is calculated using the following equations, which include torque distribution coefficients (determined by number of gear teeth), input torque to the center differential, and torque capacity of the multi-plate clutch as factors.

1) When the front wheel speed is higher than the rear wheel speed:

$$T_R = 0.543 \times T_i + T_C$$

$$T_F = 0.457 \times T_i - T_C$$

where

T_R : Rear wheel output torque

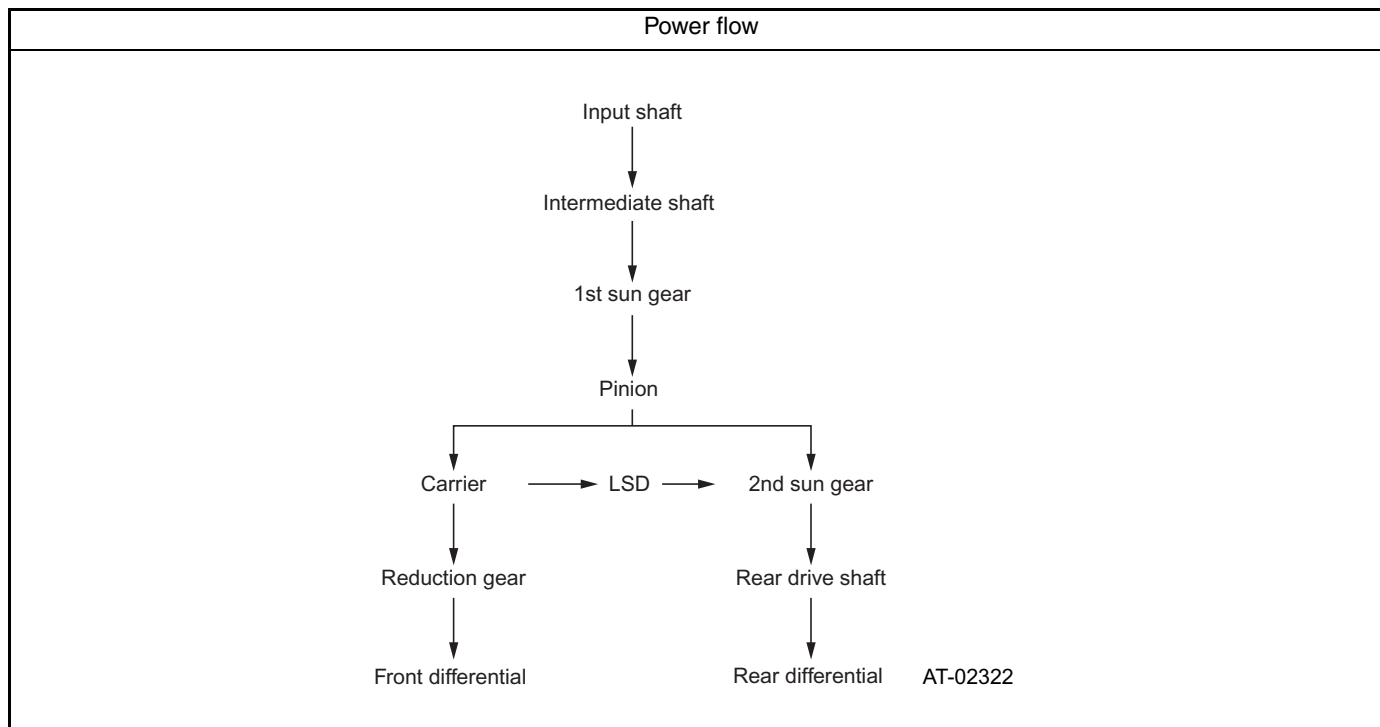

T_i : Input torque to center differential

T_C : Torque capacity of multi-plate clutch

T_F : Front wheel output torque

0.543: Coefficient of rear wheel torque determined by number of gear teeth

0.457: Coefficient of front wheel torque determined by number of gear teeth

AWD TRANSFER SYSTEM

AUTOMATIC TRANSMISSION

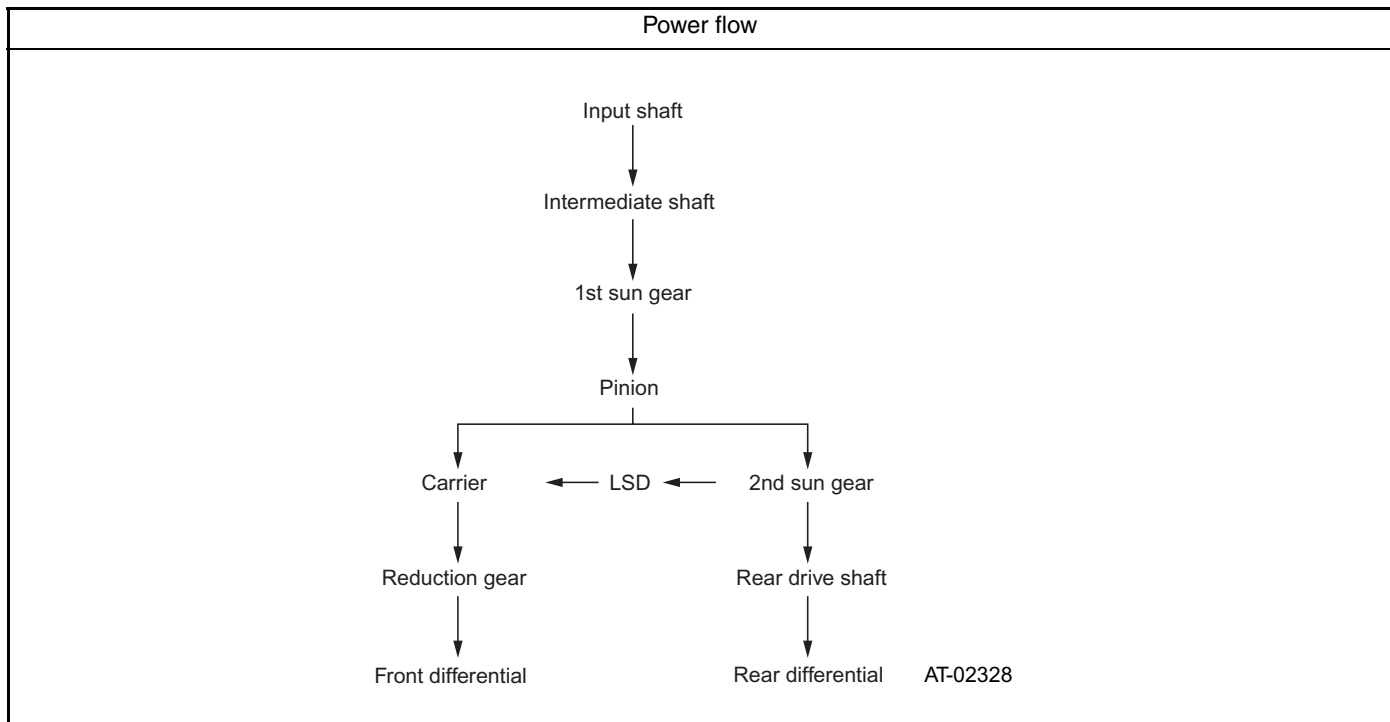

AT-01552

2) When the rear wheel speed is higher than the front wheel speed:

$$T_R = 0.543 \times T_i - T_C$$

$$T_F = 0.457 \times T_i + T_C$$

AWD TRANSFER SYSTEM

AUTOMATIC TRANSMISSION

AT-01553

<Calculation of front and rear wheel torques>

If the frictional resistance resulting from meshing of the planetary gears and sliding of rotational components are ignored, the torques distributed to the front and rear wheels are expressed by the following equations:

$$T_R = [(Z_{P1} \times Z_{S2}) \div (Z_{S1} \times Z_{P2})] \times T_i$$

$$T_F = [1 - (Z_{P1} \times Z_{S2}) \div (Z_{S1} \times Z_{P2})] \times T_i$$

where

Z_{P1} : Number of teeth of 1st planetary gear

Z_{P2} : Number of teeth of 2nd planetary gear

Z_{S1} : Number of teeth of 1st sun gear

Z_{S2} : Number of teeth of 2nd sun gear

T_i : Input torque

If the number of teeth in each component is the same as that assumed in the equations on the previous page, the following ratios are the calculation results of the equations shown above.

$$T_R = 0.543 \times T_i$$

$$T_F = 0.457 \times T_i$$

As a result, the front-rear torque distribution ratio of the compound planetary gear set without an adjustment by the multi-plate clutch is 45.7 : 54.3.

C: CONSTRUCTION

1. CENTER DIFFERENTIAL ASSEMBLY

The center differential is a compound planetary gear set without internally-toothed gears. Input torque is transmitted to the 1st sun gear of the center differential, and from the 1st sun gear the torque is distributed through the 1st pinion to the carrier (output element of front wheel side), and to the 2nd sun gear (output element of rear wheel side) at a certain ratio.

The compound planetary gears use helical gears for quiet operation and strength. The four pinions are arranged to ensure the best motion balance during operation.

3. TRANSFER HYDRAULIC PRESSURE CONTROL UNIT

The transfer hydraulic control unit consists of the transfer linear solenoid installed in the transmission hydraulic control valve assembly and the transmission hydraulic control valve.

The transfer linear solenoid controls the transfer pilot pressure in accordance with the differential action limiting force determined by the TCM based on driving and road conditions, and the transfer hydraulic control valve regulates the line pressure into transfer pressure in accordance with the transfer pilot pressure.

The transfer pressure is sent through the passages formed in the transmission case and extension case to the clutch piston chamber.

ELECTRO-HYDRAULIC CONTROL SYSTEM

AUTOMATIC TRANSMISSION

14. Electro-hydraulic Control System

A: DESCRIPTION

The electro-hydraulic control system for the transmission and transfer consists of various sensors and switches, TCM, and the control valves including solenoid valves. The system controls the automatic transmission operation, including gear shifting, lockup clutch operation, line pressure, pilot pressure, and gear-shift timing. It also controls the operation of the transfer clutch. The TCM determines vehicle operating conditions from various input signals and controls a total of eight solenoids (front brake solenoid, low coast brake solenoid, input clutch solenoid, high and low reverse clutch solenoid, direct clutch solenoid, lockup solenoid, line pressure solenoid, and transfer solenoid) by sending appropriate signals to them.

AT-02246

ELECTRO-HYDRAULIC CONTROL SYSTEM

AUTOMATIC TRANSMISSION

B: CONTROL ITEMS

Control items		Description of control	
Transmission hydraulic control	Shifting control	Shift pattern selection	Upshift points and downshift points are set for each range and shift pattern selected by switch operation, according to throttle position and vehicle speed. <Ref. to 5AT section, Transmission Control Module (TCM).>
		Control of linear solenoid for each shift clutch	The linear solenoid for each shift clutch is directly controlled in accordance with the target gear speed. Supported by the learning control and real time feedback functions, control values are corrected any time when necessary to improve shift quality and eliminate errors due to aging.
		Engine braking control	In manual mode, the low coast brake ON-OFF solenoid is controlled to make engine braking available in 1st and 2nd speeds.
	Lockup control	Base lockup control	Lockup engagement and disengagement points are set for each range and shift pattern selected by switch operation, according to throttle position and vehicle speed, and the lockup solenoid is controlled in accordance with these points to engage or disengage the lockup clutch inside the torque converter.
		Smooth control	When the lockup clutch is engaged, the pressure is gradually changed to ensure a smooth engagement.
	Line pressure control	Ordinary control	Line pressure is properly regulated according to information such as the electronic control throttle position, engine torque value, engine speed, vehicle speed, and range position.
		Control during engine braking	Line pressure is regulated in accordance with the vehicle speed while engine braking is used.
		Line pressure control in during shifting	Line pressure is regulated to the necessary value during gear shifting.
		Line pressure control when ATF temperature is low	Hydraulic pressure is controlled to a higher value than normal when the ATF temperature is low.
	AWD center differential control	Ordinary transfer control	Multi-plate clutch (LSD) pressure is regulated according to the torque input to the transfer and the driving condition.
Start control		LSD pressure is regulated according to the torque input to the transfer. Compared to normal control, the control pressure is raised to prevent slip.	
Turning control		When the front and rear wheel speed ratio is less than the set value for a vehicle speed, the LSD pressure is decreased.	
Slip control		When a front or rear wheel starts slipping, the LSD pressure is increased.	
Control while ABS/vehicle dynamics control (VDC) in operation		When ABS/vehicle dynamics control (VDC) operation signal is received, the LSD pressure is adjusted to the set level.	
Base brake control		When the brake switch is ON and throttle valve is fully closed, the LSD pressure is lowered.	

ELECTRO-HYDRAULIC CONTROL SYSTEM

AUTOMATIC TRANSMISSION

C: CONTROL OF HYDRAULIC PRESSURE FOR SHIFTS

- Control of linear solenoid for each shift clutch

The linear solenoid for each shift clutch is directly controlled by means of electrical current in accordance with the target gear speed. The control current value is corrected any time when necessary by the learning control and real time feedback functions to improve shift quality and eliminate errors due to aging.

- Engine braking control

In manual mode, the low coast brake solenoid is controlled to make engine braking available in 1st and 2nd speeds.

D: LOCKUP CONTROL

- By engaging the lockup clutch in the torque converter, the slip in the torque converter is eliminated and power is transmitted more effectively.

- Based on signals from the TCM, the lockup solenoid is controlled in order to let the lockup control valve operate and adjust apply pressure/release pressure, to consequently vary the lockup clutch engagement force.

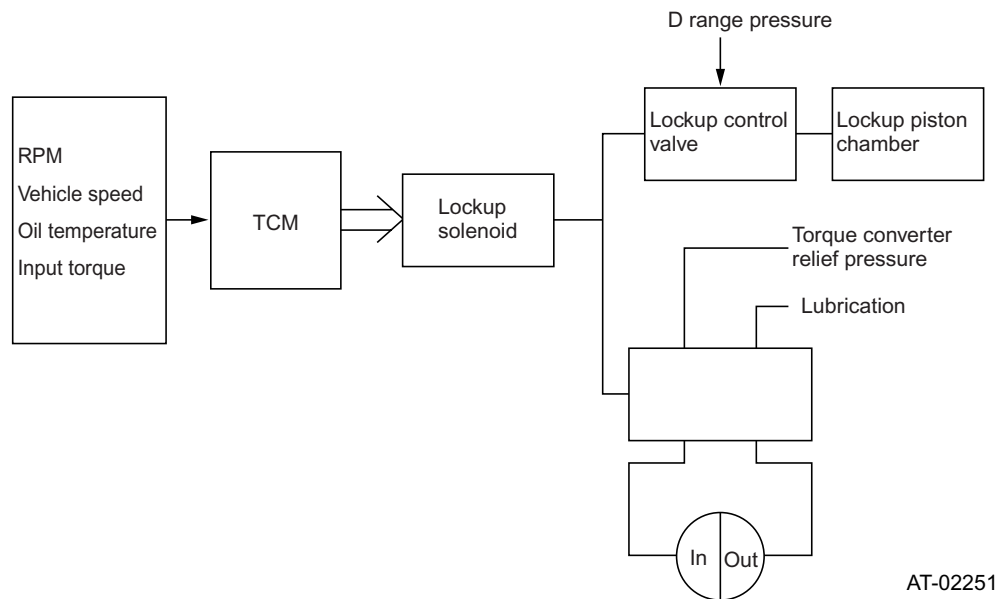

Lockup operation conditions

Select lever	Gear position	Full lockup
D range	3	Δ
	4	Δ
	5	○
Manual mode	3	○
	4	○
	5	○

Δ: When the hill climbing mode is selected according to driving conditions, or when high ATF temperature is detected.

ELECTRO-HYDRAULIC CONTROL SYSTEM

AUTOMATIC TRANSMISSION

1. LOCKUP DISENGAGED STATE

When lockup is disengaged, the lockup solenoid causes the lockup control valve to open the clutch disengaging port, and the lockup operating pressure is added to the disengaging circuit. In the meantime, the lockup clutch control valve opens the lockup clutch engaging port and allows the hydraulic fluid in the circuit to flow to the ATF cooler, thus lowering the pressure in the engaging circuit. As a result, the lockup clutch is disengaged due to difference in pressure between both circuits. This operation is performed in all speed gears.

2. LOCKUP ENGAGED STATE

When lockup is engaged, the lockup solenoid puts the lockup control valve in the lockup state and builds up lockup operating pressure.

The lockup control valve then opens the clutch engaging circuit's port that communicates to the torque converter's impeller chamber, allowing high pressure fluid to flow to the lockup clutch and the clutch is engaged.

This operation is performed in all speed gears, and the lockup engages in response to the vehicle speed when the 5th gear is selected in the D range.

3. SMOOTH LOCKUP CONTROL

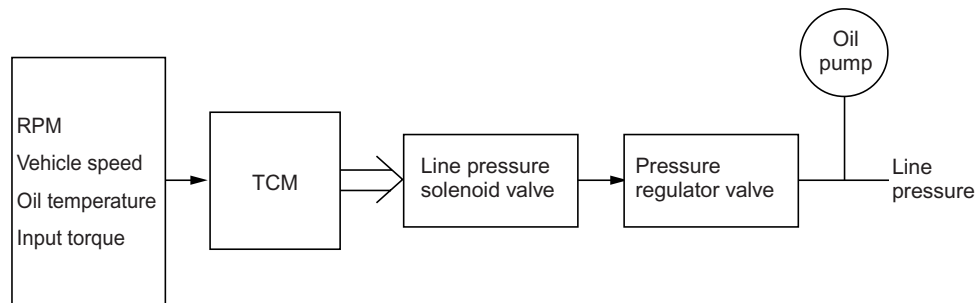

During the transition period from the lockup (disengaged) state to the lockup engaged state, the TCM controls the current output to the lockup solenoid. By changing the current output to the lockup solenoid and gradually raising the lockup clutch pressure, the lockup clutch piston is first put in a partially engaged state and its pressure is gradually increased to reduce shock.

ELECTRO-HYDRAULIC CONTROL SYSTEM

AUTOMATIC TRANSMISSION

E: LINE PRESSURE CONTROL

When torque signals corresponding to the engine drive power is sent from the ECM to the TCM, the TCM controls the line pressure solenoid. Using the line pressure solenoid pressure as a signal pressure, the pressure regulator valve is controlled, and the ATF discharged from the oil pump is regulated to an optimum level corresponding to the vehicle's running conditions.

AT-02256

1. LINE PRESSURE CONTROL IN NORMAL CONDITIONS

The line pressure which engages shift clutches to create 1st to 4th speeds, is regulated to a pressure required at each clutch according to the input torque.

AT-02261

ELECTRO-HYDRAULIC CONTROL SYSTEM

AUTOMATIC TRANSMISSION

2. LINE-PRESSURE CONTROL DURING ENGINE BRAKING IN SPORTS MODE

When engine braking is used to let the transmission downshift, the line pressure is regulated in accordance with the vehicle speed.

3. LINE-PRESSURE CONTROL DURING SHIFTING

During shifting, the line pressure is set to a level suitable for the input speed, input torque and the difference between the required and current gear speed.

ELECTRO-HYDRAULIC CONTROL SYSTEM

AUTOMATIC TRANSMISSION

4. LINE PRESSURE CONTROL WHEN ATF TEMPERATURE IS LOW

When the ATF temperature is low, the line pressure control characteristics is set higher than normal so that the clutches and brakes will operate at an earlier stage.

15.Sensor Systems

A: REAR VEHICLE SPEED SENSOR

This vehicle speed sensor is a Hall element type sensor and is externally mounted on the extension case. It detects the rear wheel speed in terms of the peripheral speed of the rear drive shaft and sends pulse signals (22 pulses per rotation) to the TCM.

(1) Rear vehicle speed sensor

B: FRONT VEHICLE SPEED SENSOR

This vehicle speed sensor is a Hall element type sensor and is mounted on the inside of the transmission case. It detects the drive pinion shaft speed and sends pulse signals (16 pulses per rotation) to the TCM.

Signals from the front and rear vehicle speed sensors are used to calculate controlling vehicle speed, which is in turn used for gear shift control.

(1) Front vehicle speed sensor

SENSOR SYSTEMS

AUTOMATIC TRANSMISSION

C: ATF TEMPERATURE SENSOR 1, 2

These temperature sensors are thermistors and each of them is mounted on the control valve body. ATF temperature sensor 1 detects the ATF temperature in the oil pan, and ATF temperature sensor 2 detects the ATF temperature at the torque converter outlet; each sensor outputs electrical resistance signals.

(1) ATF temperature sensor 1

(2) ATF temperature sensor 2

SENSOR SYSTEMS

AUTOMATIC TRANSMISSION

D: TURBINE SPEED SENSOR 1, 2

Wheel speed sensors are hall element type sensors. Turbine speed sensor 1 detects the speed of the front sun gear, and turbine sensor 2 detects the speed of the front carrier. Each sensor sends pulse signals (60 pulses per rotation) to the TCM. From these two speed values, the TCM calculates the turbine speed and uses it for shifting control.

AUTOMATIC TRANSMISSION

E: INHIBITOR SWITCH

The inhibitor switch is installed in the control valve and is connected to the TCM with 4 signal lines. The TCM uses this signal to detect range positions and to perform various controls. Relation between signals from the 4 lines (INH1 to 4) and range positions are as shown below:

	INH1	INH2	INH3	INH4
P				
R	○			○
N	○	○		
D	○	○	○	○

When the range position is detected as P or N as shown above, the TCM sends a signal (PN signal) allowing operation of the starter. On the other hand, in R or D range, starter operation is inhibited to ensure safety.

Additionally, when the range position is detected as R, the TCM turns the backup light relay output to ON and lets the backup lights illuminate.

(1) Inhibitor switch

F: LINE PRESSURE SOLENOID

The line pressure solenoid is mounted on the control valve and is directly controlled by electrical current instructions from the TCM. This controls the pressure modifier valve and accumulator control valve A to adjust the line pressure to an optimum pressure level suitable for operating conditions.

(1) Line pressure solenoid

G: LOCKUP SOLENOID

The lockup solenoid is mounted on the control valve and is directly controlled by electrical current instructions from the TCM. It then controls the lockup control valve to provide smooth engagement and disengagement. It also enables stable slip lockup control while supported by learning control and real time feedback functions.

(1) Lockup solenoid

SENSOR SYSTEMS

AUTOMATIC TRANSMISSION

H: FRONT BRAKE SOLENOID

The front brake solenoid is mounted on the control valve and is directly controlled by electrical current instructions from the TCM. This solenoid is activated when the front brake is to be engaged. Control values are corrected any time when necessary by the learning control and real time feed-back functions to improve shift quality and eliminate errors due to aging.

AT-01579

(1) Front brake solenoid

I: INPUT CLUTCH SOLENOID

The input clutch solenoid is mounted on the control valve and is directly controlled by electrical current instructions from the TCM. This solenoid is activated when the input clutch is to be engaged. Control values are corrected any time when necessary by the learning control and real time feed-back functions to improve shift quality and eliminate errors due to aging.

AT-01617

(1) Input clutch solenoid

J: DIRECT CLUTCH SOLENOID

The direct clutch solenoid is mounted on the control valve and is directly controlled by electrical current instructions from the TCM. This solenoid is activated when the direct clutch is to be engaged. Control values are corrected any time when necessary by the learning control and real time feedback functions to improve shift quality and eliminate errors due to aging.

The direct clutch pressure can be switched to two range pressures with the direct clutch piston switch valve.

AT-01618

(1) Direct clutch solenoid

K: HIGH AND LOW REVERSE CLUTCH SOLENOID

The high and low reverse clutch solenoid is mounted on the control valve and is directly controlled by electrical current instructions from the TCM. This solenoid is activated when the high and low reverse clutch is to be engaged. Control values are corrected any time when necessary by the learning control and real time feedback functions to improve shift quality and eliminate errors due to aging.

AT-01620

(1) High and low reverse clutch solenoid

SENSOR SYSTEMS

AUTOMATIC TRANSMISSION

L: LOW COAST BRAKE SOLENOID

The low coast brake solenoid is mounted on the control valve and is directly controlled by ON/OFF instructions from the TCM. This solenoid is activated when the low coast brake is to be engaged during usage of engine braking in 1st or 2nd speed in manual mode.

AT-01619

(1) Low coast brake solenoid

M: TRANSFER SOLENOID

The transfer solenoid is mounted on the control valve and is directly controlled by electrical current instructions from the TCM. This ensures optimum AWD control in accordance with the varying road conditions by engaging/releasing the transfer clutch.

AT-01615

(1) Transfer solenoid

N: MEMORY BOX

The memory box is mounted on the control valve and stores hydraulic correction values and learned values for the initial shifting pressures for each solenoid, based on its hydraulic characteristics at the time delivered from the factory. The TCM acquires data from this memory box and performs correction based on these data to control each solenoid. This ensures high quality shifting from the time the vehicle was delivered from the factory.

AT-01637

(1) Memory box

TRANSMISSION CONTROL MODULE (TCM)

AUTOMATIC TRANSMISSION

16. Transmission Control Module (TCM)

The TCM receives various sensor signals and determines the running conditions of the vehicle. It then sends control signals to each solenoid according to the preset gearshift characteristic data, lockup operation data, and transfer clutch torque data.

TRANSMISSION CONTROL MODULE (TCM)

AUTOMATIC TRANSMISSION

B: SCHEMATIC DIAGRAM

TRANSMISSION CONTROL MODULE (TCM)

AUTOMATIC TRANSMISSION

C: SHIFTING CONTROL

1. ORDINARY SHIFT CONTROL

The TCM controls each solenoid based on input signal information such as inhibitor switch signals, vehicle speed signals and accelerator pedal position signals, to automatically select the optimum gear position from the shifting map.

2. ENGINE COOPERATIVE CONTROL

During shifting, the TCM outputs a torque-down requirement signal, and the ECM receives this to retard the ignition timing of each cylinder to temporarily decrease the output torque from the engine. Simultaneously with this control, the TCM constantly monitors the shift sequence through vehicle speed sensors and the turbine speed sensor to perform feedback control and optimize gear shifts. Because of this control, a smooth and comfortable gear shifting is ensured under all conditions.

3. ABS COOPERATIVE CONTROL

When the ABS is operating, the optimum gear speed for the vehicle speed is selected by cooperative operation with the ABSCM to prevent degrading the operation of the ABS.

4. CONTROL AT HIGH OIL TEMPERATURES

If the ATF temperature becomes extremely high, shifting control is performed by automatically switching to a shifting map that is less likely to cause temperature rise.

5. CONTROL WHEN ATF OR ENGINE COOLANT TEMPERATURE IS LOW

When the ATF temperature or engine coolant temperature is extremely low at engine start, etc., shifting control is performed by automatically switching to a shifting map that causes temperature rise easier.

6. CONTROL WHEN CRUISE CONTROL IN OPERATION

When the cruise control is operating, shifting control is performed by automatically switching to a shifting map that is suitable for cruise control.

TRANSMISSION CONTROL MODULE (TCM)

AUTOMATIC TRANSMISSION

MEMO

TRANSMISSION CONTROL MODULE (TCM)

AUTOMATIC TRANSMISSION

D: SHIFT PATTERN SELECTION

1. ADAPTIVE CONTROL

This control is performed to improve the drivability of the vehicle by optimizing gear shifts in accordance with the driver's intention to accelerate or decelerate, and driving conditions such as hill climbing, winding road driving, etc.

- Shift pattern automatic switching control

This control enables selection of the optimum gear speed by automatically switching the shift pattern by estimating driver's intentions and driving conditions through sensor information such as driving resistance, engine speed, acceleration, vehicle speed, and also from calculated values.

Any of the three patterns NORMAL, SPORTS, and SLOPE are continuously and automatically selected under the following conditions.

D range

NORMAL↔SPORTS↔SLOPE

D range, in sports mode

SPORTS↔SLOPE

Normal pattern: covers a wide range from normal driving to high speed driving.

Sports pattern: a shift pattern suitable for driving conditions requiring deep accelerator pedal positions, such as winding road driving.

Slope pattern: this shift pattern controls upshifting to prevent too frequent gear shifting during climbing or descending hills. By combining braking control (in sports mode only) (explained later), automatic engine braking will be available when descending hills.

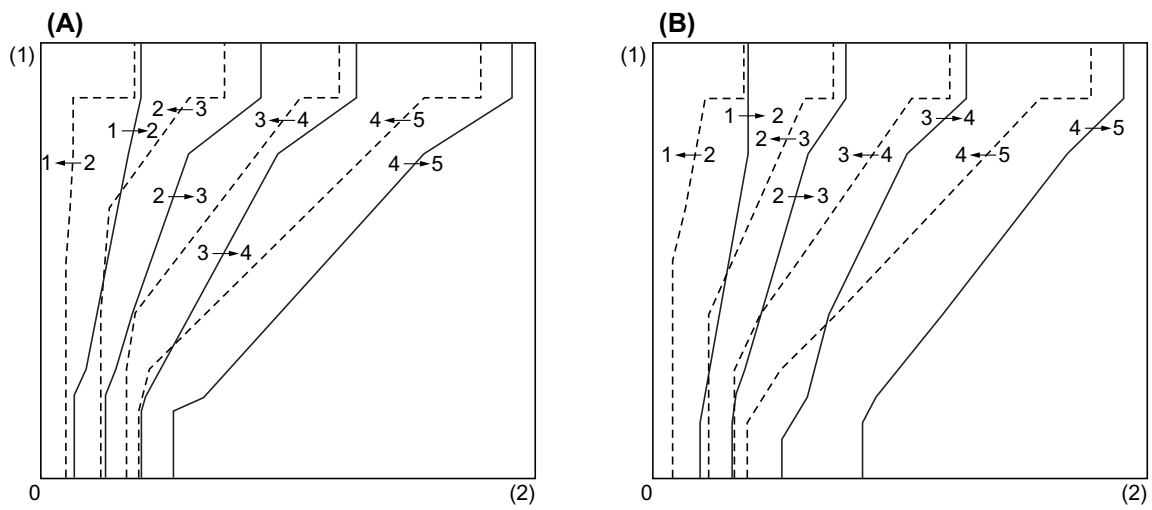

TRANSMISSION CONTROL MODULE (TCM)

AUTOMATIC TRANSMISSION

AT-01731

- (1) Without climb/descend control
- (2) With climb/descend control
- (3) Brake pedal ON
- (4) Re-acceleration

AT-01730

- (A) Base pattern
- (1) Accelerator pedal position
- (B) Grade control pattern
- (2) Vehicle speed

TRANSMISSION CONTROL MODULE (TCM)

AUTOMATIC TRANSMISSION

- Accelerator pedal quick depressing control

When the accelerator pedal is quickly depressed, the TCM interprets this as acceleration is required, and the transmission is downshifted earlier to obtain a greater drive force.

- Accelerator pedal quick return control

When the accelerator pedal is quickly released, the TCM interprets this as deceleration is required, and upshift is prohibited in order to hold the transmission in the current gear speed to prevent frequent shifting and to maintain engine braking effect (operates in sports mode only).

- Braking control

According to the braking force (deceleration) during braking, downshifts are hastened to ensure engine braking effect and obtain a larger driving power for accelerating after braking (operates in sports mode only).

- Control during cornering

When the system interprets that the vehicle is turning a corner by the lateral acceleration and the change rate in vehicle speed, it prevents unwanted upshifts to maintain a stable drive force and cornering performance.

2. SPORTS MODE CONTROL

When the shift lever is moved toward the manual gate side in D range, the SPORT light in the combination meter illuminates and the system enters the Sports mode. Gearshift timings are set at higher vehicle and engine speeds to make more use of low speed gears. The full lockup vehicle speed in 5th is also set higher than in the normal mode.

TRANSMISSION CONTROL MODULE (TCM)

AUTOMATIC TRANSMISSION

3. MANUAL MODE CONTROL

By operating the “+” or “-” switch on the select lever or steering wheel in D range with the sports mode switch ON (in sports mode), the system switches to manual mode. In this mode, operating the “+” switch causes upshifting while operating the “-” switch causes downshifting; manual shifting is enabled and the selected gear position is held while driving.

However, at certain vehicle speeds or ATF temperatures, the following inhibiting control is performed.

- Upshift inhibiting and auto downshift control

The gear upshifts each time the “+” switch is operated, however, when the vehicle speed is too low for the selected gear speed, the TCM inhibits further upshifting. If the vehicle speed becomes too slow for the current gear speed, a downshift will be made automatically to prevent engine stall. When the vehicle comes to a stop, the transmission will always be controlled to shift to 1st speed unless the vehicle was in manual 2nd hold control.

- Downshift inhibiting control

The gear downshifts each time the “-” switch is operated, however, when the vehicle speed is too low for the selected gear speed, the TCM inhibits further shifting. A manual shifting inhibiting buzzer will sound to warn the driver.

- Control when oil temperature is low

When the ATF temperature is low as in cases such as immediately after start in winter, upshifting to 5th is inhibited to quicken warm up.

- Engine over speed prevention control

If the engine speed exceeds the preset value during accelerating, the fuel supply is cut to prevent over-revving of the engine.

4. 2nd HOLD CONTROL (IN MANUAL MODE)

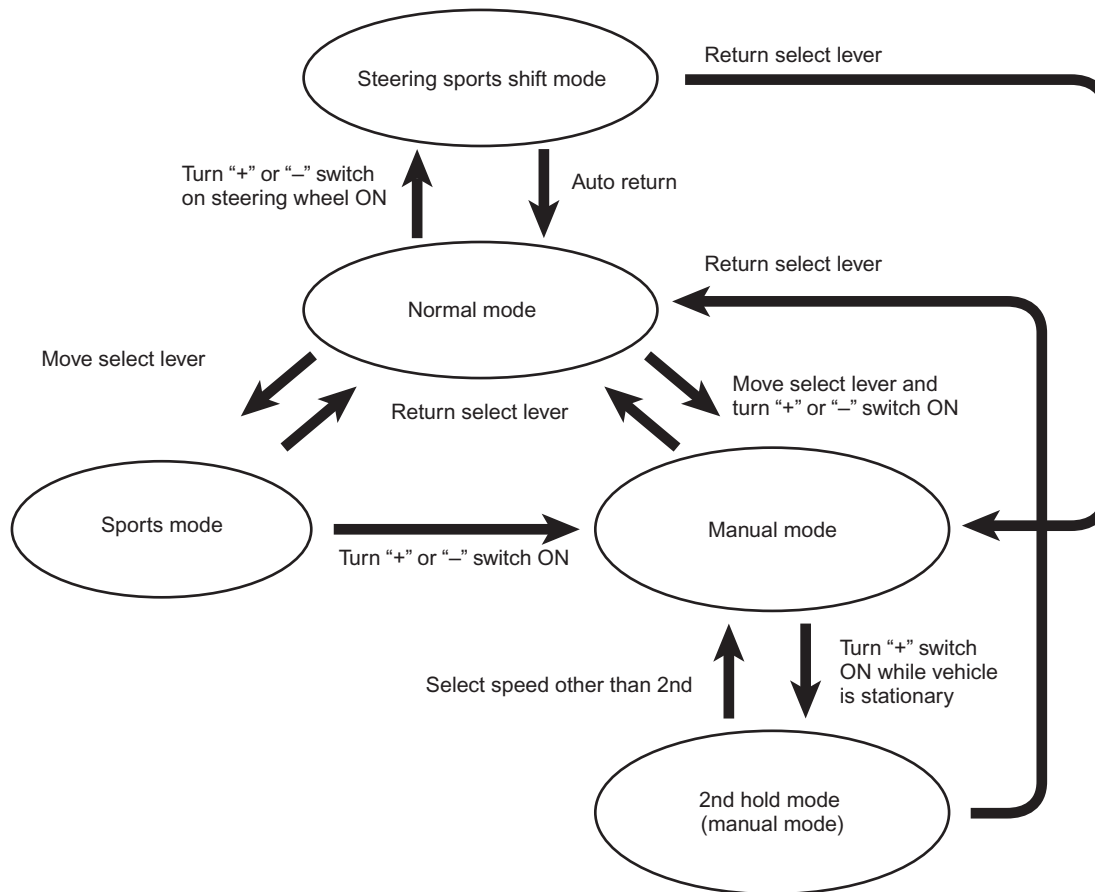

When the “+” switch is operated when the vehicle is in manual mode and not moving, the transmission shifts to 2nd speed enabling start in 2nd. This status is held unless the manual mode is canceled, or a speed other than 2nd is selected with the “-” switch. Also, the transmission is held in 2nd when the vehicle is stopped.

TRANSMISSION CONTROL MODULE (TCM)

AUTOMATIC TRANSMISSION

5. STEERING SPORTS SHIFT CONTROL

By operating the “+” or “-” switch on the steering wheel in D range during Normal mode, the system can be temporary switched to manual mode to perform manual shift operations. In this mode, the mode automatically returns to the previous mode when the next operation is not performed within a specified time or when the vehicle is put in the straight forward accelerating state.

AT-02970

TRANSMISSION CONTROL MODULE (TCM)

AUTOMATIC TRANSMISSION

6. ILLUMINATION CONTROL OF VARIOUS INDICATORS

Illuminations of the various indicators on the combination meter are controlled in accordance with the shift pattern selection as shown below.

Indicator					
Status	D ●	SPORT	▲ ▼	1	Operation mode
Normal D range	D ●	SPORT	△ ▽	(extinguished)	Normal mode
In sports mode	D ●	SPORT	△ ▽	(extinguished)	Sports mode
Manual mode	D ○	SPORT	▲ ▼	1 — 5	Manual mode
When engine oil temperature is high and high engine speed is maintained	D ○	SPORT	△ ▽	—	Manual mode (at high oil temperature)
In steering sports shift	D ○	SPORT	▲ ▼	1 — 5	Semi sports shift mode
When engine oil temperature is high and high engine speed is maintained (upper row: first 2 seconds, lower row: thereafter)	D ●	SPORT	△ ▽	—	Normal mode (at high oil temperature)
	D ●	SPORT	△ ▽	(extinguished)	Normal mode (at high oil temperature)

NOTE:

- Indicators printed in solid black show their illuminated status.
- ATF TEMP indicator illuminates to inform of high ATF temperature.

AT-02882

TRANSMISSION CONTROL MODULE (TCM)

AUTOMATIC TRANSMISSION

E: CONTROL VALVE HYDRAULIC PRESSURE CORRECTION CONTROL AND LEARNING CONTROL

- **Control valve hydraulic pressure correction control**

During this control, the TCM acquires the hydraulic pressure correction data stored for each control valve in the memory box installed on the control valves, and then correctively controls the instruction current to each solenoid based on the data. This ensures stable shifting quality irrespective of variance between units.

- **Learning control of shifting hydraulic pressures**

To constantly ensure excellent shift quality regardless of the variance between friction material and aging, learning control of shifting hydraulic pressures is used.

Learning takes place for every normal shifting under certain conditions, and the learned values are saved in the flash ROM of the TCM. The values are not cleared even when the power is turned OFF (or the battery's negative terminal disconnected).

F: AWD CENTER DIFFERENTIAL CONTROL

1. CONTROL DESCRIPTION

Engagement of the multi-plate clutch (LSD) in the center differential is controlled according to the torque input to the transfer. It selects a map according to driving conditions and use it as the control basis.

2. NORMAL CONTROL

The input torque to the multi-plate clutch is calculated according to various factors such as engine torque signals, torque converter turbine speed and selected gear position. Based on the calculation result, the basic coupling force of the clutch is determined.

3. START CONTROL

When the vehicle speed is 0 km/h (0 MPH), the TCM increases the engaging force of the multi-plate clutch to a higher level compared to that of normal control.

This enables the vehicle to start smoothly without swerving even on a slippery road.

4. TURNING CONTROL

The TCM makes a correction such that the engagement force of the multi-plate clutch is reduced as the steering angle increases.

This function is performed to improve turning performance at certain vehicle speed range.

TRANSMISSION CONTROL MODULE (TCM)

AUTOMATIC TRANSMISSION

5. SLIP CONTROL

When front or rear wheels start slipping with the vehicle running slower than the predetermined speed, the TCM makes control to increase the differential action limiting torque.

This function maintains traction and improves driving stability.

AT-00737

- | | |
|--------------------------------------|---------------------|
| (A) Front and rear wheel speed ratio | (1) Slip control |
| (B) Front wheel slip | (2) Turning control |
| (C) Rear wheel slip | (3) Normal control |
| (D) Low | (4) Start control |
| (E) Vehicle speed | |
| (F) High | |

6. ABS CONTROL

When the TCM receives an ABS operation signal from the ABSCM, it adjusts the differential action limiting torque to the predetermined level.

This function improves ABS control.

7. BASE BRAKE CONTROL

When the brake switch is ON and the throttle valve is fully closed, the TCM makes control to decrease the differential action limiting torque. The ABS control has priority over this control.

This function improves stability during braking.

G: RANGE LOCK CONTROL

This control prevents the select lever from being moved to the R position when the vehicle is running. Thus damage to components such as the reverse clutch is prevented.

When the specified speed is exceeded the TCM turns off the shift lock solenoid for the select lever. Therefore the range lock control works to inhibit operation from N range to R range, preventing the transmission from put into reverse.

ON-BOARD DIAGNOSTICS SYSTEM

AUTOMATIC TRANSMISSION

17. On-board Diagnostics System

A: FUNCTION

- The on-board diagnosis system detects and indicates a fault by generating a code corresponding to each fault location. The engine malfunction indicator light (SPORTS indicator light) on the combination meter indicates occurrence of a fault or abnormality.
- When the engine malfunction indicator light comes on as a result of detection of a fault by the TCM, the corresponding diagnostic trouble code (DTC) is stored in the TCM.
- On OBD-II available vehicles, it is necessary to connect the SUBARU Select Monitor (SSM) to the data link connector in order to check the DTC.
- To provide various functions and to facilitate fault isolation, a diagnosis system compatible with the SSM is used.
- The on-board diagnostics system detects the following electrical system faults or abnormalities in the system.

ATF temperature sensor 1, 2	Inhibitor switch
Turbine speed sensor 1, 2	CAN communication system
Front and rear wheel speed sensors	Interlock decision
Lockup solenoid (circuit, function)	1st engine brake abnormal
Line pressure solenoid (circuit)	Range lock solenoid (circuit)
Front brake solenoid (circuit, function)	PN signal output
Input clutch solenoid (circuit, function)	PVign power circuit (PVign relay)
High and low reverse clutch solenoid (circuit, function)	Backup light relay output circuit
Direct clutch solenoid (circuit, function)	TCM data communication abnormal
Low coast brake solenoid (circuit, function)	Lateral G sensor
Transfer solenoid (circuit)	Brake switch
Front brake hydraulic switch	Sports mode switch
Input clutch hydraulic switch	Engine speed signal
High and low reverse clutch hydraulic switch	1, 2, 3, 4, 5, R gear ratios
Direct clutch hydraulic switch	

If a fault is detected, the system tells the fault by causing the SPORTS indicator light to blink.

ON-BOARD DIAGNOSTICS SYSTEM

AUTOMATIC TRANSMISSION

B: OPERATION OF SPORTS INDICATOR LIGHT

On starting the engine, the SPORTS indicator light illuminates for bulb check and then goes out as shown in the Normal diagram below. If any problem exists, the light continues flashing as shown in the Abnormal diagram below.

AT-02194

- (A) When normal
- (B) Abnormal

- (1) Engine cranking
- (2) Abnormality detected
- (3) 2 seconds
- (4) 0.25 seconds

FAIL-SAFE FUNCTION

AUTOMATIC TRANSMISSION

18.Fail-safe Function

- Front and rear vehicle speed sensors, rear wheel speed sensor abnormal

If a fault is detected in either or both of the front vehicle speed sensor and rear vehicle speed sensor, the vehicle speed information received from the ABS unit via CAN communication is substituted for control. This enables normal quality shifting.

- Inhibitor switch abnormal

If an input of other than the specified pattern is entered to the TCM, the select position indicator lights in the combination meter are turned off, the starter is disabled, the reverse light is disabled, the transmission is fixed in D range, and manual mode is inhibited.

- PN signal abnormal

The output is turned OFF (starter inhibited) if an abnormality is detected in the PN signal output. However, if the ECM is receiving range signals through the backup of CAN communication, the starter can be used in P and N ranges.

- AT interlock decision

If an AT interlock decision is made, the vehicle's minimum mobility is maintained by fixing the transmission in 2nd, 4th or 5th speeds in accordance with the engaging pattern detected by the hydraulic switch. Relation between the hydraulic switch detection pattern and fixed gear speeds are as shown in the following table.

- Engine braking in 1st abnormal decision

If 1st engine braking abnormal decision is made, the low coast brake solenoid is deactivated to cancel the engine braking effect.

- Line pressure solenoid abnormal

The solenoid is deactivated and the line pressure set at maximum, 5th speed is inhibited. Except for this, the system is controlled normally.

- Lockup solenoid abnormal

The solenoid is deactivated and lockup is inhibited.

- Low coast brake solenoid abnormal

If the solenoid is failed and stuck in its ON state (electrically or mechanically) the transmission is fixed in 2nd speed, and when the solenoid is failed and stuck in its OFF state (electrically or mechanically) the solenoid is constantly turned OFF. (Engine braking is made not available in 1st and 2nd speeds.)

- Input clutch solenoid abnormal

If the solenoid is failed and stuck in its ON or OFF state (electrically or mechanically) the transmission is fixed in 4th speed to maintain mobility.

- Direct clutch solenoid abnormal

If the solenoid is failed and stuck in its ON or OFF state (electrically or mechanically) the transmission is fixed in 4th speed to maintain mobility.

- Front brake solenoid abnormal

If the solenoid is failed and stuck in its ON state (electrically or mechanically) the transmission is fixed in 5th speed, and when the solenoid is failed and stuck in its OFF state (electrically or mechanically) the transmission is fixed in 4th speed to maintain mobility.

- High and low reverse clutch solenoid abnormal

If the solenoid is failed and stuck in its ON or OFF state (electrically or mechanically) the transmission is fixed in 4th speed to maintain mobility.

FAIL-SAFE FUNCTION

AUTOMATIC TRANSMISSION

- Transfer clutch solenoid abnormal

If the solenoid is failed and stuck in its ON or OFF state, the transfer solenoid output is constantly turned OFF.

- Turbine sensor 1, 2 abnormal

Shifting control is performed without using turbine sensor values to maintain minimum mobility. 5th speed and manual mode are inhibited.

- TCM data communication abnormal

If communication with the memory box on the control valves fails, backup values stored in the TCM are used for controlling the solenoids.

- CAN communication abnormal

If an abnormality occurs in CAN communication, data received via CAN communication are fixed to preset values to perform shift control and maintain minimum mobility. Lockup and manual mode are inhibited.

TRANSMISSION MOUNTING

AUTOMATIC TRANSMISSION

19. Transmission Mounting

A: GENERAL

The transmission mounting consists of a pitching stopper, cushion rubber, and a cross member.

In addition to support the transmission, these components absorb noise and vibration caused by the transmission.

AT-00438

- (1) Pitching stopper
- (2) Cushion rubber
- (3) Cross member

5AT-70

FRONT SUSPENSION

FRONT SUSPENSION

1. Front Suspension

A: GENERAL

The front suspension is a McPherson strut-type independent suspension which have coil springs and dampers. The suspension on each side consists of a front arm, stabilizer, and a strut assembly.

The front arm is an "L" shaped arm. The outer end of the front arm is fixed to the front axle through a ball joint. The front of the arm's inner end is fitted to the front cross member while the rear of the inner end is fixed to the vehicle body.

The front cross member is bolted to the vehicle body.

The front cross member bears the front arm, steering gearbox, and stabilizer.

- (1) Strut
- (2) Ball joint
- (3) Front arm

- (4) Stabilizer link
- (5) Stabilizer bar
- (6) Front cross member

B: CONSTRUCTION

1. FRONT ARM

- By optimizing the shape of the front arm, a high strength and light weight are simultaneously achieved.
- The arm has a maintenance-free ball joint fitted by a castle nut at its outer end. A rubber bushing is used at the front, and a hollowed bushing is used at the rear.

FS-00134

- (1) Front arm
- (2) Front bushing
- (3) Rear bushing

FRONT SUSPENSION

FRONT SUSPENSION

2. STRUT

- The strut consists of a cylindrical double-acting low pressure gas filled damper that attenuates shock from the road surface.
- A camber angle adjustment mechanism, which uses eccentric bolts, is provided at the joint between the strut and axle housing.

3. STABILIZER

- The solid round rod stabilizer is attached to the front cross member through rubber cushions and its right and left ends are connected to the front arm through ball joints.
- The attitude change of the vehicle during a turn is controlled by the bar's torsional resistance.

FS-00135

- (1) Stabilizer bar
- (2) Stabilizer link

REAR SUSPENSION

REAR SUSPENSION

1. Rear Suspension

A: GENERAL

The rear suspension is a multilink type.

The suspension on each side consists of a rear arm, front link, upper link, rear link, sub frame support arm, shock absorber, and a coil spring.

The front link, rear link, and upper link are all attached to a sub frame which in turn is installed to the vehicle body through bushings.

This type of suspension is characterized by small changes in camber and toe-in against external input of vertical, longitudinal and lateral forces.

RS-00125

- (1) Rear stabilizer
- (2) Rear sub frame
- (3) Upper link
- (4) Rear link
- (5) Front link
- (6) Rear arm
- (7) Sub frame support arm

B: CONSTRUCTION

1. REAR ARM

- Acts mainly on longitudinal loads.
- The rear arm bears the rear brake system and rear axle bearing unit.

2. FRONT LINK

- Acts on lateral loads.
- The link is made of steel pressed in a “U” section form, and the left and right ends of the link are connected to the rear sub frame and rear arm through rubber bushings.

3. REAR LINK

- Acts on lateral loads.
- The link is made of steel pressed in a “U” section form, and the link is connected to the rear sub frame and rear arm.
- A toe-in adjustment mechanism, which uses eccentric bolts, is provided at the joint between the rear link and rear sub frame.

- (1) Rear link
- (2) Eccentric bolt

REAR SUSPENSION

REAR SUSPENSION

4. UPPER LINK

- Acts on lateral loads.
- The left and right ends of the link are connected to the rear sub frame and rear arm through rubber bushings.
- This also supports the helper and prevents bottoming of the suspension.

RS-00127

- (1) Upper link
- (2) Helper

REAR SUSPENSION

REAR SUSPENSION

5. SHOCK ABSORBER

- Acts on vertical loads together with the coil spring.
- The shock absorber is a cylindrical double-acting low pressure gas filled type and it attenuates shock from the road surface.

6. STABILIZER

- The solid round rod stabilizer is attached to the rear sub frame through rubber bushings and its right and left ends are connected to the rear arm through ball joints of the stabilizer link.
- The attitude change of the vehicle during a turn is controlled by the bar's torsional resistance.

- (1) Stabilizer bar
- (2) Stabilizer link

REAR SUSPENSION

REAR SUSPENSION

7. HELPER

- The helper acts as a bump stopper together with the upper link by limiting the shock absorber stroke when the vehicle encounters a bump.

RS-00130

(1) Helper

REAR SUSPENSION

REAR SUSPENSION

8. SUB FRAME SUPPORT ARM

- Made of steel pipe whose both ends fixed to the rear arm bracket and rear sub frame.
- Restricts the twist between the rear sub frame and vehicle body.

- (1) Sub frame support arm
- (2) Rear arm
- (3) Rear shock absorber

WHEEL & TIRE

WHEEL AND TIRE SYSTEM

1. Wheel & Tire

TIRE PRESSURE MONITORING SYSTEM

WHEEL AND TIRE SYSTEM

2. Tire Pressure Monitoring System

A: GENERAL

To comply with the requirements of FMVSS No. 138, a direct detecting type tire pressure monitoring system, which consists of four transmitters (each integrated with a tire air valve) and a receiver (installed under the driver's seat) is introduced.

WT-00075

- (1) Indicator lights
- (2) Transmitter
- (3) Receiver

TIRE PRESSURE MONITORING SYSTEM

WHEEL AND TIRE SYSTEM

B: TRANSMITTER (TIRE PRESSURE SENSOR)

Detects the tire pressure with the sensor built inside the transmitter, which is integrated with the tire air valve.

The sensor contains a battery as a power source.

The battery life is 10 years or 160,000 km (100,000 miles).

The battery cannot be replaced separately; when the battery becomes weak the whole sensor assembly must be replaced.

WT-00076

- (1) Transmitter (tire pressure sensor)
- (2) Nut
- (3) Tire pressure sensor built-in part
- (4) Wheel
- (5) Tire

When the vehicle speed increases to 11 — 32 km/h (7 — 20 MPH), the roll switch built in the sensor turns ON, and the sensor starts to transmit pressure data*¹ together with the ID code*² and function code*³.

When the switch is turned ON, the transmitter takes measurement once in every 30 seconds, and sends the result once in every minute.

When the vehicle is stopped for 15 minutes or more, the sensor enters sleep mode to minimize battery consumption.

*1: Detected tire pressure data

*2: ID code allocated to each transmitter

*3: A code indicating the current transmitter mode

The transmitter switches its mode according to its condition as follows.

These condition information are referred to as “function codes”.

TIRE PRESSURE MONITORING SYSTEM

WHEEL AND TIRE SYSTEM

Function codes

Mode	Code	Function
Learn mode	000	This is the initial mode when the transmitter is turned ON using a transmission activation tool (ST).
Low battery mode	001	Enters this mode when the transmitter battery voltage drops. This code is transmitted when the transmitter voltage becomes low.
OFF mode	010	Transmitter is OFF (no pressure detection, no data transmission).
Re-measure mode	011	This code is transmitted if the detected pressure differs by 8.4 kPa (0.086 kgf/cm ² , 1.218 psi) or more compared with the previous data. (sudden change in pressure due to tire burst, tire pressure adjustment, etc.)
Wake mode	101	This code is transmitted when the condition changes from vehicle stopped (transmitter roll switch OFF and data not transmitted) to vehicle running (transmitter roll switch turns ON and data transmission starts).
Normal pressure mode	111	This code is transmitted when the condition is none of the above; vehicle normally running or stopped (within 15 minutes after stopped).

TIRE PRESSURE MONITORING SYSTEM

WHEEL AND TIRE SYSTEM

C: RECEIVER

The receiver has a built-in antenna.

The receiver collects tire pressure data from the transmitters, and turns on the indicator to warn the driver when it concludes that the tire pressure has dropped below a certain value.

The receiver is provided with a system fault diagnosis function.

TIRE PRESSURE MONITORING SYSTEM

WHEEL AND TIRE SYSTEM

1. RECEIVER FUNCTIONS

- Receiving function: Receives data from the transmitters and decides whether the data is valid or not.
- Pressure judgment function: The indicator turns ON to warn the driver if the tire pressure drops below the preset value (180 kPa, 1.835 kgf/cm², 26.11 psi). At the same time, a diagnostic trouble code is stored in the memory inside the receiver to identify which tire has low pressure. (low pressure detection turns ON at 180 kPa (1.835 kgf/cm², 26.11 psi), turns OFF at 200 kPa (2.039 kgf/cm², 29.01 psi))
- Diagnosis function: The indicator flashes and a diagnostic trouble code is stored in the memory inside the receiver if a system abnormality such as data reception failure, bad received data, or bad transmitter condition is detected.

2. CONDITIONS JUDGED AS A FAILURE

The receiver decides that the system has failed when any of the following conditions is met.

- EEPROM abnormal: The written data does not coincide with the loaded data when the ID is registered.
- Data reception failure: Transmitter data could not be received for 10 minutes or more while driving at a speed exceeding 40 km/h (24.9 MPH).
- Function code abnormal: "Re-measure" function code is received for 5 times in series, though the pressure change compared to the last data was within 7 kPa (0.071 kgf/cm², 1.02 psi) while driving at a speed exceeding 40 km/h (24.9 MPH).
- Air pressure data abnormal: "FFH"* pressure data has been received for 5 times in series while driving at a speed exceeding 40 km/h (24.9 MPH).
- Low battery: Function code for the "low battery" mode has been received for 20 times or more in series.
- Vehicle speed sensor abnormal: Function code for the "wake" mode has been received while the vehicle speed signal is 6 km/h (3.7 MPH) or lower.

*FFH is transmitted when the pressure data exceeds the upper limit (352kPa, 3.59 kgf/cm², 51.05 psi) of pressure detection.

If the indicator comes ON due to low tire pressure, the indicator will turn OFF when the under-inflated tire is inflated to normal pressure.

TIRE PRESSURE MONITORING SYSTEM

WHEEL AND TIRE SYSTEM

D: SUBARU SELECT MONITOR

The Subaru Select Monitor (SSM) enables the user to perform the following operations.

- Transmitter ID registration: The new ID can be registered when the transmitter is replaced due to battery life, etc.
- Data monitoring: The status of the function code, tire pressure, vehicle speed, indicator illuminating pressure, or I/O signal can be displayed.
- ID data display: The registered four IDs and the currently received data for each ID can be displayed.
- Diagnostic trouble codes display: Stored diagnostic trouble codes can be read.
- Erasing diagnostic trouble codes: Diagnostic trouble codes can be erased after repair work is completed.

REAR DIFFERENTIAL

DIFFERENTIALS

C: VA 2 TYPE

The drive gear is a hypoid gear with nominal diameter of 160 mm (6.30 in). The drive pinion shaft is supported by three bearings. The bearing preload is adjusted by selecting a spacer and washer combination of a proper thickness. The drive pinion height is adjusted by properly selecting the thickness of the washers located at the drive pinion neck using a dummy shaft and gauge. The hypoid gear has uniform height teeth.

DI-00388

LIMITED SLIP DIFFERENTIAL (LSD) (VISCOUS COUPLING TYPE)

DIFFERENTIALS

2. Limited Slip Differential (LSD) (Viscous Coupling Type)

A: GENERAL

The limited slip differential (LSD) automatically limits the differential action and distributes torque to the left and right wheels adequately to enhance driving stability when the left and right wheels are rotating at speeds different from each other during driving on a slippery road (muddy, snow-covered or slushy road) or cornering.

B: CONSTRUCTION

The V/C (viscous coupling) type LSD has outer plates and inner plates arranged alternately. Each outer plate is splined to the inside of the differential case at its outer periphery and each inner plate is splined to the outer circumference of the left side gear at its inner periphery.

The outer plates are held in position by spacer rings while the inner plates can slide in the axial direction along the spline teeth.

The space between the differential case and the left side gear is filled with a mixture of high viscosity silicone oil and air and hermetically sealed with X-rings.

DI-00295

| (5) Pinion shaft | (10) X-ring |

LIMITED SLIP DIFFERENTIAL (LSD) (VISCOUS COUPLING TYPE)

DIFFERENTIALS

C: OPERATION

1. WHEN RIGHT AND LEFT WHEELS ROTATE AT THE SAME SPEED

During normal straight-ahead driving where the right and left wheels rotate at the same speed, the differential case and side gears rotate together, just as in conventional differentials. As a result, driving torque is distributed equally to the right and left side gears.

DI-00296

LIMITED SLIP DIFFERENTIAL (LSD) (VISCOUS COUPLING TYPE)

DIFFERENTIALS

2. WHEN RIGHT AND LEFT WHEELS ROTATE AT DIFFERENT SPEEDS

When a speed difference occurs between the right and left wheels, the differential case and the left side gear do not rotate at the same speed any more. The speed difference between them corresponds to that between both the wheels. Because of the shear force caused in the silicone oil, a differential torque is then generated, which limits differential action.

For example, if the left wheel spins due to small road resistance, a speed difference occurs between the right and left wheels. Since there is the V/C between the differential case and left side gear, a differential torque corresponding to the speed difference is generated in the V/C. This differential torque is transferred from the left wheel to the right wheel. As a result, a greater driving torque is distributed to the right wheel which is rotating at a lower speed.

When the right wheel spins, the differential torque is transferred from the right wheel to the left wheel. Also in this case, a torque greater by the differential torque than the torque to the spinning wheel is transmitted to the wheel rotating at the lower speed.

When left wheel spins

ANTI-LOCK BRAKE SYSTEM (ABS)

ABS

1. Anti-lock Brake System (ABS)

A: FEATURES

- To reduce the size and weight, this ABS has a hydraulic control unit, an ABS control module, a valve relay and a motor relay integrated into a single unit (called ABSCM & H/U).
- The ABS electrically controls the brake fluid pressure to each wheel to prevent the wheel from locking during braking on slippery road surfaces, thereby enabling the driver to maintain the directional control.
- If the ABS becomes inoperative, a fail-safe system is activated to ensure same level of braking performance as with a conventional brake system. In that case, the warning light comes on to indicate that the ABS is malfunctioning.
- The ABS is a 4-sensor, 4-channel system. The system is a four-wheel independent control type, which controls each of the wheel brakes individually.

B: FUNCTIONS OF SENSORS AND ACTUATORS

Name		Function
ABS control module and hydraulic control unit (ABSCM & H/U)	ABSCM section	<ul style="list-style-type: none"> ● It determines the conditions of the wheels and the vehicle body from the wheel speed data and controls the hydraulic unit depending on the result. ● When the ABS is active, the ABSCM provides the automatic transmission control module with control signals which are used by the module for cooperative control of the vehicle with the ABSCM. ● Whenever the ignition switch is placed at ON, the module performs a self diagnosis sequence. If anything wrong is detected, the module cuts off the system. ● It communicates with the SUBARU select monitor.
	H/U section	<ul style="list-style-type: none"> ● When the ABS is active, the H/U changes fluid passages to the wheel cylinders in response to commands from the ABSCM. ● It constitutes the brake fluid passage from the master cylinder to the wheel cylinders together with the piping.
	Valve relay section	It serves as a power switch for the solenoid valves. It operates in response to a command from the ABSCM.
	Motor relay section	It serves as a power switch for the pump motor. It operates in response to a command from the ABSCM.
ABS wheel speed sensor		Detects speed of each wheel and sends to the ABSCM.
Magnetic encoder		Incorporated with the hub unit bearing and causes the ABS wheel speed sensor to generate electrical signals.
G sensor		It detects a change in acceleration in the longitudinal direction of the vehicle and outputs it to the ABSCM as a voltage signal.
Stop light signal		Detects ON-OFF status of the brake pedal and sends to the ABSCM. The ABSCM uses it to determine ABS operation.
ABS warning light		It alerts the driver to an ABS fault.
Automatic transmission control module		It provides gear controls and changing power transmission to front and rear wheels in response to control signals from the ABSCM.
Brake warning light		It alerts the driver to an EBD fault. This warning light is also used for parking brake warning and brake fluid level warning.

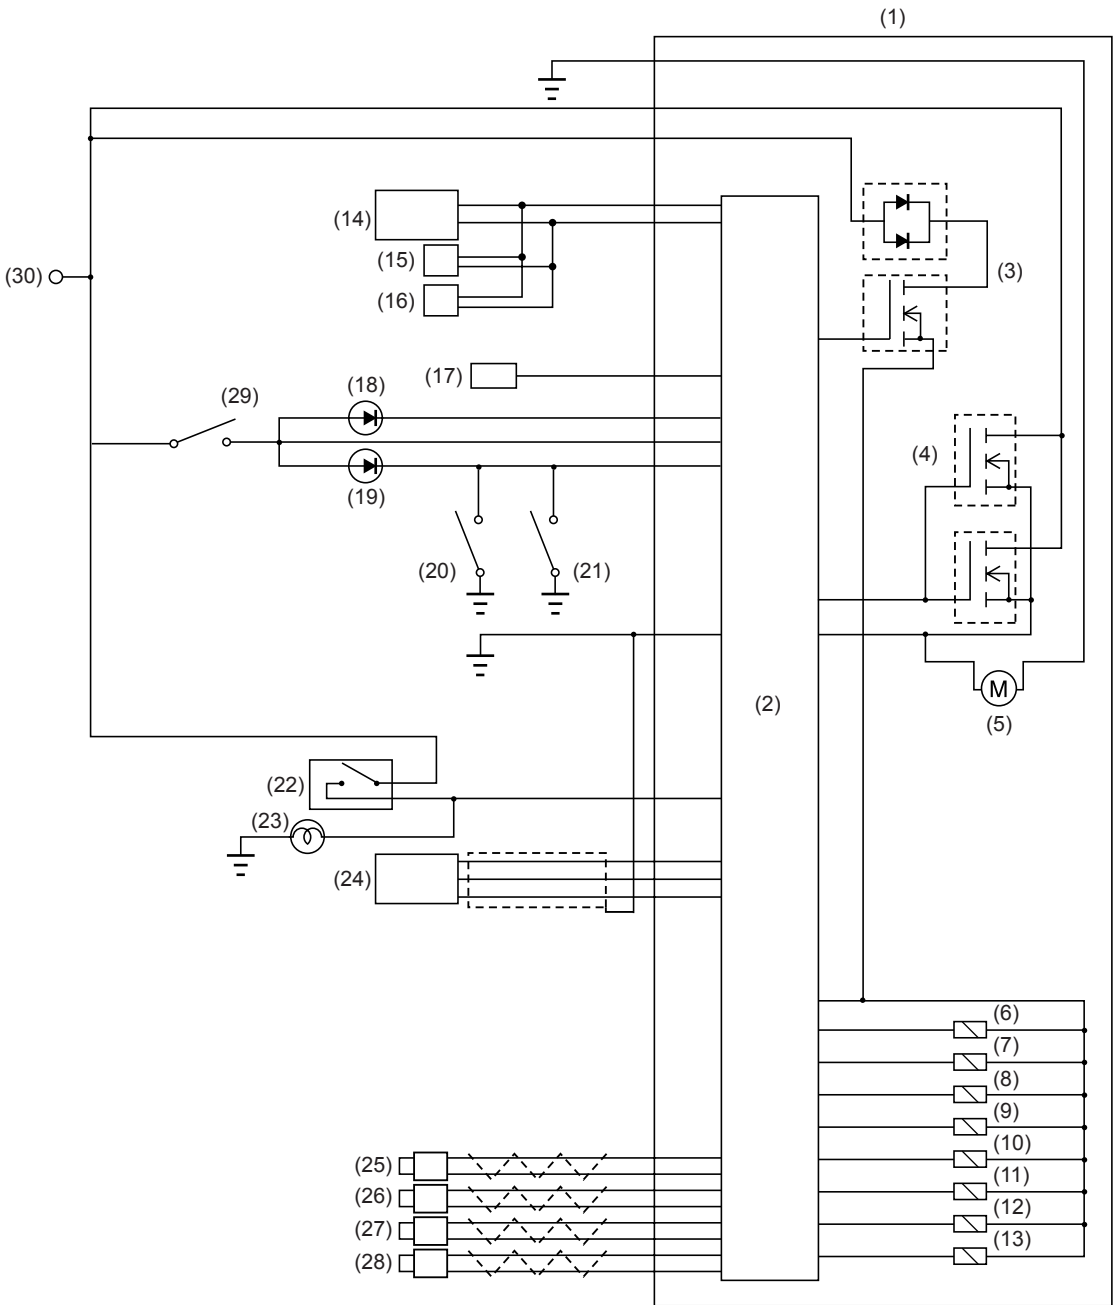

ANTI-LOCK BRAKE SYSTEM (ABS)

ABS

C: PRINCIPLE OF ABS CONTROL

When the brake pedal is depressed during driving, the wheel speed decreases and the vehicle speed does as well. The decrease in the vehicle speed, however, is not always proportional to the decrease in the wheel speed. The non-correspondence between the wheel speed and vehicle speed is called “slip” and the magnitude of the slip is expressed by the “slip ratio” which is defined as follows:

$$\text{Slip ratio} = (\text{Vehicle speed} - \text{Wheel speed}) / \text{Vehicle speed} \times 100\%$$

When the slip ratio is 0%, the vehicle speed corresponds exactly to the wheel speed. When it is 100%, the wheels are completely locking while the vehicle is moving.

The braking effectiveness is represented by the “coefficient of friction” between the tire and road surface. The larger the coefficient, the higher the braking effectiveness. The diagram below shows the relationship between the coefficient of friction and the slip ratio for two different road surface conditions (asphalt-paved road and icy road), assuming that the same tires are used for both the conditions and the vehicles are moving forward. Although the braking effectiveness (coefficient of friction) depends on the road surface condition as shown and also on the type of the tire, its peak range generally corresponds to the 8 — 30% range of the slip ratio.

The ABS controls the fluid pressure to each wheel to maintain the slip ratio within this range.

ABS00007

(A) Slip ratio

(B) Coefficient of friction between tire and road surface

(1) Icy road

(2) Asphalt-paved road

(3) Control range by ABS

D: ABS WHEEL SPEED SENSOR

Each of the ABS wheel speed sensors detects the speed of the corresponding wheel. The sensor consists of a sensor body and a magnetic encoder. The magnetic encoder is a permanent magnet with N poles and S poles arranged alternately, and when this turns together with the wheel the magnetic field at the sensing area of the sensor body changes. The sensor body has a hall element and outputs signals at a frequency proportional to the wheel speed.

ANTI-LOCK BRAKE SYSTEM (ABS)

ABS

E: EBD (ELECTRONIC BRAKE FORCE DISTRIBUTION)

The EBD system utilizes the function of the conventional ABS. This system prevents premature locking of the rear wheels by using electronic control instead of a proportioning valve. The system provides a feature to optimize the brake force distribution to the front and rear wheels according to change in loading conditions or displacement of the center of gravity during deceleration.

The ABSCM calculates the optimum brake force distribution from the difference in speed between the front and rear wheels. Based on the results, the ABSCM controls the rear wheel brake pressure through the ABS hydraulic unit (H/U) to achieve the optimum brake force distribution suitable for the driving condition.

The proportioning valve is disused on EBD equipped vehicles.

- (1) Brake force to rear wheels
- (2) Brake force to front wheels
- (3) Optimum brake force distribution for light loaded conditions
- (4) Optimum brake force distribution for heavy loaded conditions
- (5) EBD controlled brake force distribution
- (6) PCV controlled brake force distribution (reference)

F: ABS CONTROL MODULE AND HYDRAULIC CONTROL UNIT (ABSCM & H/U)

- **ABS control module section (ABSCM)**

The ABSCM contains two micro control modules (MCMs) which communicate with each other. Both the MCMs process the same program and each MCM monitors the other's outputs. If a mismatch occurs between their outputs, the ABSCM cuts off the system and activate the fail-safe function.

The ABSCM can store a maximum of 3 diagnostic trouble codes (DTC) in a ROM. If more than 3 faults have occurred, only the 3 most recent failures are stored and others are erased. Trouble diagnostic trouble codes remain stored until they are internally or externally erased.

The ABSCM has a test routine (sequence control pattern) which facilitates checking of the hydraulic control unit.

- **ABS control**

Using primarily the wheel speed data from each ABS wheel speed sensor and secondarily the vehicle deceleration rate data from the G sensor as parameters, the ABSCM generates a simulated vehicle speed when there is a risk of wheel lock-up. Using the simulated vehicle speed (called "dummy" vehicle speed) as a reference, the ABSCM determines the state of the wheel in terms of the tendency toward lock-up. If the result shows that the wheels are about to lock, the ABSCM issues commands to energize or de-energize the solenoid valves and activate the motor pump of the H/U to modulate the brake fluid pressures that act on the wheel cylinders, thereby preventing the wheels from locking.

The ABSCM controls the fluid pressure to each of the four wheels independently.

- **Functions available using SUBARU select monitor**

When the SUBARU select monitor is connected, the ABSCM allows it:

- To read out analog data
- To read out ON/OFF data
- To read out or erase diagnostic trouble codes
- To read out data showing conditions under which a trouble code has been stored (freeze frame data)
- To initiate ABS sequence control pattern

- **Indication functions**

Under the control of the ABSCM, the ABS warning light provides the following two indication functions:

- ABS fault alerting
- Valve ON/OFF indication (when sequence control pattern is initiated)

ANTI-LOCK BRAKE SYSTEM (ABS)

ABS

- **Hydraulic control unit section (H/U)**

The H/U is a fluid pressure controller consisting of, among others, a motor, solenoid valves, a housing and relays. It also constitutes passage of the two diagonally split brake circuits.

- The pump motor drives an eccentric cam which in turn moves the plunger pump to generate hydraulic pressure.
- The housing accommodates the pump motor, solenoid valve and reservoir. It also constitutes a brake fluid passage.
- The plunger pump, when operated, draws the brake fluid from the reservoir, lets the fluid in a wheel cylinder drain into the reservoir, and/or forces the fluid into the master cylinder.
- The outlet solenoid valve is a 2-position type. It opens or closes the brake fluid passage between a wheel cylinder and the reservoir according to commands from the ABSCM.
- The inlet solenoid valve is duty-controlled to reduce brake fluid pulsation for minimum ABS operation noise.
- The reservoir temporarily stores the brake fluid drained from a wheel cylinder when pressure “decrease” control is performed.
- The valve relay controls power supply to the solenoid valves in response to a command from the ABSCM. In normal (IG ON) condition, the relay is closed to supply power to the solenoid valves. When an error occurs in the system, the valve relay is turned OFF to keep the fluid pressure circuit in the normal mode (non-ABS mode).
- The motor relay closes and supplies power to the pump motor in response to a command from the ABSCM during the ABS drive mode operations.
- The H/U has four operating modes; normal mode (non-ABS mode), and three ABS active modes, i.e., “increase”, “hold” and “decrease” modes.

ANTI-LOCK BRAKE SYSTEM (ABS)

ABS

1. DURING NORMAL BRAKING (ABS NOT ACTIVE)

Both the inlet and outlet solenoid valves are not energized.

This means that the inlet port of the inlet solenoid valve is open, whereas the outlet port of the outlet solenoid valve is closed. So the fluid pressure generated in the master cylinder is transmitted to the wheel cylinder, producing a brake force.

NOTE:

For simplicity of explanation, operation of the hydraulic control unit is represented by operation of a single wheel circuit.

ANTI-LOCK BRAKE SYSTEM (ABS)

| (5) Deenergized | (11) Deenergized |
| (6) Pump | (12) Reservoir |

ANTI-LOCK BRAKE SYSTEM (ABS)

ABS

2. PRESSURE “DECREASE” CONTROL (ABS ACTIVE)

Both the inlet and outlet solenoid valves are energized, which means that the inlet port is closed and the outlet port is open.

In this state, the wheel cylinder is isolated from the master cylinder but open to the reservoir, so the brake fluid in it can be drained into the reservoir, decreasing its pressure and reducing the braking force of the wheel.

The brake fluid collected in the reservoir is forced into the master cylinder by the pump.

During this phase of ABS operation, the pump motor continues operating.

NOTE:

For simplicity of explanation, operation of the H/U is represented by operation of a single wheel circuit.

ANTI-LOCK BRAKE SYSTEM (ABS)

| (5) Energized | (11) Energized |
| (6) Pump | (12) Reservoir |

ANTI-LOCK BRAKE SYSTEM (ABS)

ABS

3. PRESSURE “HOLD” CONTROL (ABS ACTIVE)

The inlet solenoid valve is energized, so the inlet port is closed.

On the other hand, the outlet solenoid valve is de-energized, so the output port is also closed. In this state, all the passages connecting the wheel cylinder, master cylinder and reservoir are blocked. As a result, the fluid pressure in the wheel cylinder is held unchanged.

During this phase of ABS operation, the pump motor continues operating.

NOTE:

For simplicity of explanation, operation of the H/U is represented by operation of a single wheel circuit.

ANTI-LOCK BRAKE SYSTEM (ABS)

ABS

4. PRESSURE “INCREASE” CONTROL (ABS ACTIVE)

Both the inlet and outlet solenoid valves are de-energized, which means that the inlet port of the inlet solenoid valve is open, whereas the outlet port of the outlet solenoid valve is closed. So the fluid pressure generated in the master cylinder is transmitted to the wheel cylinder and increased fluid pressure in the wheel cylinder applies the brake with a larger force.

During this phase of ABS operation, the pump motor continues operating.

NOTE:

For simplicity of explanation, operation of the H/U is represented by operation of a single wheel circuit.

G: ABS CONTROL CYCLE CURVES

Depressing the brake pedal increases the brake fluid pressure in each wheel cylinder, which in turn decreases the wheel speed (or increases the wheel deceleration rate). When the brake fluid pressure is increased to a level of point "A" of the brake fluid pressure curve in the diagram (at which the wheel deceleration rate exceeds threshold " $-b_0$ "), the ABSCM makes a pressure "hold" control. At the same time, the ABSCM calculates a "dummy" vehicle speed which is a reference speed it uses in the next stage of control.

When the wheel speed then drops below the slip ratio setting, i.e., a speed lower than the "dummy" vehicle speed by the predetermined value (at point "B" of the pressure curve), the ABSCM makes a control to prevent the wheel from locking, or a pressure "decrease" control.

As the wheel cylinder pressure decreases, the wheel speed starts increasing (or the wheel acceleration rate starts rising). When the wheel acceleration rate exceeds threshold " $+b_{10}$ " (at point "C" of the pressure curve), the ABSCM makes a pressure "hold" control. When the wheel acceleration rate exceeds threshold " $+b_{20}$ " (at point "D" of the pressure curve), the ABSCM recognizes that wheel lock-up will not occur and then makes a pressure "increase" control.

When the wheel acceleration rate drops below threshold " $+b_{20}$ ", (at point "E" of the pressure curve), the ABSCM starts pressure "hold" and "increase" control cycles at a given interval.

When the wheel deceleration rate then exceeds threshold " $-b_0$ " (at point "F" of the pressure curve), the ABSCM immediately makes a pressure "decrease" control.

ABS

H: ABS WARNING LIGHT AND BRAKE WARNING LIGHT (ALSO FUNCTIONS AS EBD WARNING LIGHT)

When a fault occurs in the signal transmission system or the ABSCM, the ABS warning light and brake warning light in the combination meter come on. At the same time, the current to the hydraulic control unit is interrupted. The brake system then functions in the same manner as a system without ABS.

If the warning light comes on, one or more diagnostic trouble codes should be stored in the ABSCM. To identify these codes, use a Subaru select monitor.

ANTI-LOCK BRAKE SYSTEM (ABS)

ABS

I: G SENSOR

The G sensor detects changes in the vehicle's acceleration/deceleration rate in the longitudinal direction.

A piezo-resistor is formed on the beam. When the mass area moves during acceleration and deceleration, the beam distorts causing the resistance of the piezo-resistor to change. This change is converted into change in voltage and sent to the ABSCM.

VEHICLE DYNAMICS CONTROL (VDC) SYSTEM

VEHICLE DYNAMICS CONTROL (VDC)

1. Vehicle Dynamics Control (VDC) System

A: GENERAL

The vehicle dynamics control (VDC) system is a driver assist system which enhances vehicle's running stability by utilizing the anti-lock brake system (ABS) and traction control system (TCS) functions in combination with its own function which reduces sudden changes in vehicle behavior that are likely to occur when traveling on a slippery road or quickly avoiding an obstacle on the road.

VEHICLE DYNAMICS CONTROL (VDC) SYSTEM

VEHICLE DYNAMICS CONTROL (VDC)

B: OPERATION PRINCIPLE OF VDC

1. OVERSTEER BEHAVIOR SUPPRESSION

When the vehicle starts to spin during cornering, the VDC control module (VDCCM) actuates the brakes on the front and rear outer wheels. As a result, a yaw moment is generated in a direction that counteracts the yaw moment resulting from oversteer so that the vehicle's behavior is stabilized.

VDC00105

- (1) Braking force
- (2) Yaw moment resulting from oversteer

VEHICLE DYNAMICS CONTROL (VDC) SYSTEM

VEHICLE DYNAMICS CONTROL (VDC)

2. UNDERSTEER BEHAVIOR SUPPRESSION

When the vehicle starts to drift outward during cornering, the VDCCM causes the rear inner wheel to be braked. As a result, a yaw moment is generated in a direction that counteracts the yaw moment resulting from understeer so that the vehicle's behavior is stabilized.

VDC00106

- (1) Braking force
- (2) Yaw moment resulting from understeer

VEHICLE DYNAMICS CONTROL (VDC) SYSTEM

VEHICLE DYNAMICS CONTROL (VDC)

C: FUNCTIONS USED IN VEHICLE'S BEHAVIOR STABILIZATION CONTROL

Vehicle dynamics control (VDC) function	The vehicle dynamics control (VDC) determines the driver's intention from the data provided by the steering angle sensor, braking pressure sensor, engine-related sensors and other relevant sources and recognizes the result as the target vehicle behavior. At the same time, it determines the vehicle's actual behavior from the data provided by the yaw-rate sensor, lateral G sensor, ABS wheel speed sensor and other relevant sources. Then, the module compares the target and actual vehicle behaviors to estimate how the vehicle is running (whether it understeers, oversteers, slips or is in other condition), and based on the result, performs braking control of individual wheels, engine output control and AWD control as necessary to correct the vehicle's running condition.
TCS function	The TCS constantly receives signals from the relevant sensors to monitor the vehicle speed. When the running wheels slip exceeding a certain limit, it performs braking control of individual wheels, engine output control and AWD control as required to maintain optimal traction and adequate side force.
ABS function	The ABS constantly receives signals from the relevant sensors to monitor the vehicle speed. When the slip of wheels during braking exceeds a certain limit, it performs braking control of individual wheels and AWD control as required to maintain optimal traction and adequate side force.

NOTE:

- "Braking control" is effected by the VDCCM as follows:

The VDCCM calculates the required braking force for each wheel and sends signals to the VDC hydraulic unit. The hydraulic unit's motor pump is then operated to generate the required hydraulic pressure. Further, it controls the hydraulic unit's solenoid valves to increase, maintain or decrease the hydraulic pressure applied to the brake wheel cylinder as required.

When the brakes are applied by the driver, however, the braking force is controlled by the hydraulic pressure resulting from the driver's action.

- "Engine output control" is effected by the VDCCM as follows:

The VDCCM calculates the target engine output for each condition, and sends commands to the engine control module. The engine control module compares the target engine output with the current engine output. Based on the comparison, the throttle opening or fuel injection is controlled. The targeted engine output is then achieved.

- "AWD control" is effected by the VDCCM as follows:

When necessary, the VDCCM sends a command to the automatic transmission control module. According to the command, the transmission control module controls the transfer clutch so that the torque is distributed between the front and rear axles optimally.

VEHICLE DYNAMICS CONTROL (VDC) SYSTEM

VEHICLE DYNAMICS CONTROL (VDC)

D: SYSTEM COMPONENTS AND FUNCTIONS

VDCCM	<ul style="list-style-type: none"> • Determines the vehicle's running condition from various sensor signals and, based on the result, controls the vehicle dynamics control (VDC) hydraulic unit, ABS and TCS as required. • Performs CAN communication with the engine control module, automatic transmission control module and the steering angle sensor. • Causes the system to stop and the warning light to illuminate if a fault occurs in a circuit of the electrical system. Stores the code that indicates the location of the fault.
Vehicle dynamics control (VDC) hydraulic unit (VDCH/U)	Actuates the pump motor in response to a command from the VDCCM and changes fluid passages using solenoid valves to control the hydraulic pressures applied to the wheel cylinders.
Steering angle sensor	Detects the steering direction and angle when the steering wheel is operated by the driver, and outputs signals corresponding to them to the CAN line.
Yaw-rate and lateral G sensor	Detects the yaw-rate and lateral G of the vehicle and outputs it to the VDCCM.
Pressure sensor	Detects the hydraulic pressure resulting from driver's brake pedal operation and outputs it to the VDCCM.
ABS wheel speed sensor	Detects the speed of each wheel and outputs it to the VDCCM.
Engine control module (ECM)	Controls the engine output in response to commands from the VDCCM. Further, it transmits current engine output and engine speed signals etc. to the VDCCM.
Automatic transmission control module	Controls the transfer clutch in response to commands from the VDCCM during vehicle dynamics control (VDC) control, ABS control or TCS control so that torque is distributed optimally between the front and rear axles.
ABS warning light	Alerts the driver to an ABS fault.
Vehicle dynamics control (VDC) warning light and vehicle dynamics control (VDC) OFF indicator light	<ul style="list-style-type: none"> • Alerts the driver to a vehicle dynamics control (VDC) or TCS fault. • Illuminates to tell the driver that the vehicle dynamics control (VDC) and TCS are inactive. (when system is not failed)
Brake warning light	Alerts the driver to an EBD fault. This warning light is also used for parking brake warning and brake fluid level warning.
Vehicle dynamics control (VDC) operation indicator light	Blinks when the vehicle dynamics control (VDC) is operating or lights steadily when the TCS is operating.
Vehicle dynamics control (VDC) OFF switch	<ul style="list-style-type: none"> • Allows the driver to temporarily disengage the vehicle dynamics control (VDC). • In "temporarily disengaged" status, the vehicle dynamics control (VDC) OFF indicator light illuminates.

NOTE:

CAN (Controller Area Network) communication refers to bidirectional multiplex high-speed communication.

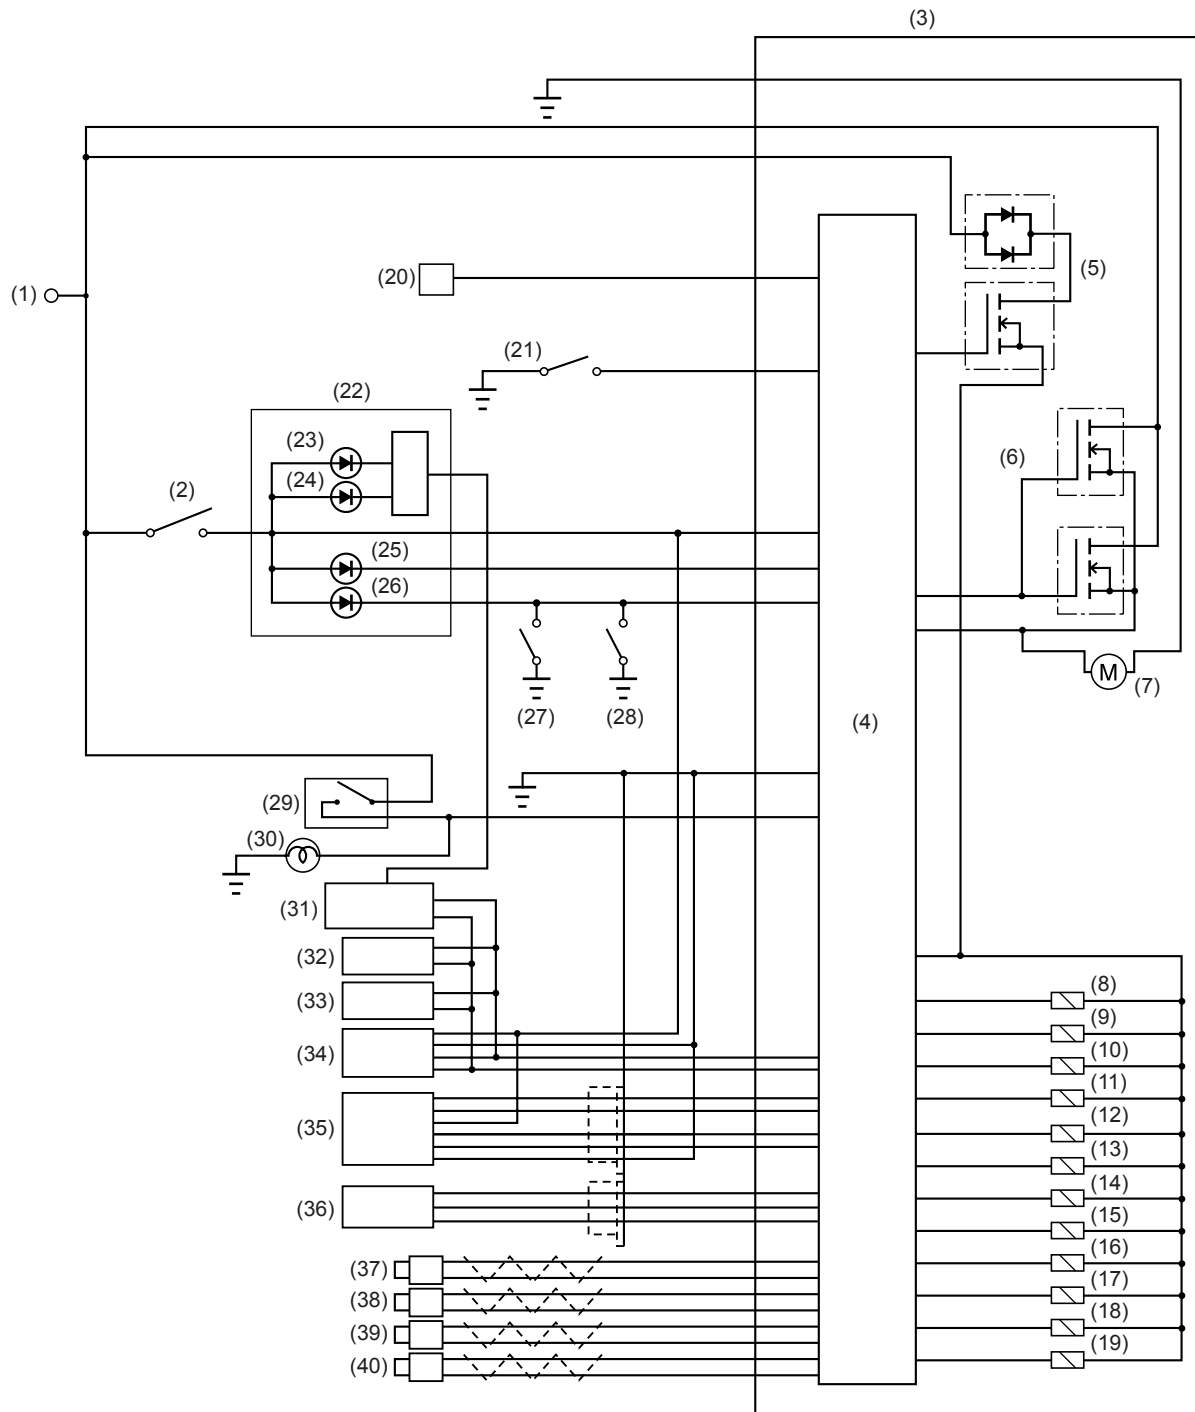

VEHICLE DYNAMICS CONTROL (VDC) SYSTEM

VEHICLE DYNAMICS CONTROL (VDC)

E: VDC OFF SWITCH

A switch which allows the driver to temporarily disengage VDC control.

In some occasions, better results are obtained by canceling the VDC to allow the drive wheels to slip for a certain amount:

- When starting the vehicle on icy or unpaved, steep uphill roads.
- When escaping from mud or snow when the wheels are caught in them.
- When the VDC OFF switch is pressed while the engine is running, the VDC OFF indicator light in the combination meter illuminates, and VDC control is temporarily disengaged. When the VDC OFF switch is pressed again, the VDC OFF indicator light turns off and the system returns to “engaged” status. (Temporarily disengaged status and engaged status are altered each time the switch is pressed.)
- If the VDC OFF switch is pressed and held for more than 10 seconds, the VDC OFF indicator light in the combination meter turns off. The system will not allow further operation of the switch until the engine is started for the next time.

VDC00249

VEHICLE DYNAMICS CONTROL (VDC) SYSTEM

VEHICLE DYNAMICS CONTROL (VDC)

F: OPERATION OF VDC HYDRAULIC UNIT (VDC H/U)

1. DURING NORMAL BRAKING

No solenoid valves are energized. The ports of the inlet solenoid valve and cut solenoid valve are open, while the ports of the outlet solenoid valve and suction solenoid valve are closed.

In this state, the fluid pressure generated by the master cylinder can be applied to the wheel cylinder through the open ports of the cut solenoid valve and inlet solenoid valve.

NOTE:

For simplicity of explanation, operation of the hydraulic unit is represented by operation of a single wheel circuit.

2. PRESSURE “DECREASE” CONTROL WITH BRAKE PEDAL DEPRESSED

The inlet solenoid valve and outlet solenoid valve are energized, while the other solenoid valves are not energized. This means that the ports of the inlet solenoid valve and suction solenoid valve are closed, while those of the outlet solenoid valve and cut solenoid valve are open.

Although the fluid pressure generated by the master cylinder can reach the inlet solenoid valve through the open port of the cut solenoid valve, the pressurized fluid cannot go further since the passage is blocked there. On the other hand, since the port of the outlet solenoid valve is open, the brake fluid in the wheel cylinder can flow out into the reservoir. The fluid pressure in the wheel cylinder decreases as a result. The brake fluid in the reservoir is pumped back into the master cylinder.

NOTE:

For simplicity of explanation, operation of the hydraulic unit is represented by operation of a single wheel circuit.

VEHICLE DYNAMICS CONTROL (VDC)

3. PRESSURE “HOLD” CONTROL WITH BRAKE PEDAL DEPRESSED

Only the inlet solenoid valve is energized. This means that the ports of the inlet solenoid valve, outlet solenoid valve and suction solenoid valve are all closed except that of the cut solenoid valve.

In this state, the fluid pressure generated by the master cylinder is transmitted through the open port of the cut solenoid valve to the inlet solenoid valve but not beyond the inlet solenoid valve since the passage is blocked there. Since the port of the outlet solenoid valve is also closed, the fluid pressure in the wheel cylinder is held unreleased.

The pump is always operated whenever commanded by the VDCCM.

NOTE:

For simplicity of explanation, operation of the hydraulic unit is represented by operation of a single wheel circuit.

VDC-20

VEHICLE DYNAMICS CONTROL (VDC) SYSTEM

VEHICLE DYNAMICS CONTROL (VDC)

6. PRESSURE “HOLD” CONTROL WITH BRAKE PEDAL NOT DEPRESSED

The cut solenoid valve, suction solenoid valve and inlet solenoid valve are all energized, while the outlet solenoid valve is de-energized. This means that the ports of the cut solenoid valve, inlet solenoid valve and outlet solenoid valve are closed, while the port of the suction solenoid valve is open.

In this state, the pump is activated, forcing the brake fluid in the master cylinder reservoir tank through the open port of the suction solenoid valve. The fluid passage is, however, blocked by the closed inlet solenoid valve. Since the port of the outlet solenoid valve is also closed, the fluid pressure in the wheel cylinder is held unreleased.

The fluid pressure generated by the pump becomes higher and higher because the port of the inlet solenoid valve is closed. When it reaches a certain level, the built-in relief valve of the cut solenoid valve opens and allows the brake fluid to return into the master cylinder reservoir tank.

NOTE:

For simplicity of explanation, operation of the hydraulic unit is represented by operation of a single wheel circuit.

VEHICLE DYNAMICS CONTROL (VDC) SYSTEM

VEHICLE DYNAMICS CONTROL (VDC)

7. PRESSURE “DECREASE” CONTROL WITH BRAKE PEDAL NOT DEPRESSED

The cut solenoid valve, suction solenoid valve, inlet solenoid valve and outlet solenoid valve are all energized. This means that the ports of the cut solenoid valve and inlet solenoid valve are closed, while those of the suction and outlet solenoid valves are open.

In this state, the pump is activated drawing the brake fluid from the reservoir and forcing it toward the master cylinder through the open port of the suction solenoid valve. The fluid passage is blocked by the inlet solenoid valve, so the fluid cannot flow toward the wheel cylinder. Since the port of the outlet solenoid valve is open, on the other hand, the brake fluid in the wheel cylinder is allowed to be drawn into the reservoir, so the fluid pressure in the wheel cylinder decreases. The brake fluid drawn into the reservoir is raised from it and forced into the master cylinder reservoir tank through the suction solenoid valve.

The pressure of the fluid in the passage toward the cut solenoid valve becomes higher and higher as the pump operates since the valve is closed. When the pressure reaches a certain level, the build-in relief valve of the cut solenoid valve opens, releasing the brake fluid into the master cylinder reservoir tank.

NOTE:

For simplicity of explanation, operation of the hydraulic unit is represented by operation of a single wheel circuit.

FRONT AND REAR DISC BRAKES

BRAKE

1. Front and Rear Disc Brakes

- Each of the front and rear disc brakes consist of a brake caliper, brake pads, and a brake disk rotor.
- The front disc brakes are of a ventilated disc type which features high heat dissipation and superb braking stability. The rear disc brakes are either a ventilated disk type or a solid disk type.
- Each disc rotor, which is fitted on the outside of the hub, is secured together with the wheel using the hub bolts. This facilitates its removal and installation.
- The brake pads have a wear indicator which gives a warning when the pad is worn down to the limit.

BR-00352

- (1) Disc rotor
- (2) Caliper body

FRONT AND REAR DISC BRAKES

BRAKE

A: PAD WEAR INDICATOR

A wear indicator is provided on the inner disc brake pads. When the pad wears down to 1.5 mm (0.059 in) the tip of the wear indicator comes into contact with the disc rotor, and makes a squeaking sound as the wheel rotates. This alerts the driver to the situation.

BR-00020

- (1) Wear indicator
- (2) New pad

- (3) Worn pad
- (4) Disc rotor

B: FRICTIONAL MATERIAL OF BRAKE PADS

The brake pads materials do not contain any asbestos which is harmful to human body.

MASTER CYLINDER

BRAKE

2. Master Cylinder

- The master cylinder consists of a brake fluid reservoir chamber that stores brake fluid, and a hydraulic chamber section that converts the force applied to the brake pedal into hydraulic pressure.
- The hydraulic pressure generated in each of the two hydraulic chambers are sent to the brake caliper of each wheel through the 2 diagonally split brake circuits.

BR-00366

- (1) Reservoir tank
- (2) Secondary hydraulic chamber
- (3) Primary hydraulic chamber

MASTER CYLINDER

BRAKE

A: BRAKE FLUID LEVEL SWITCH

The brake fluid level switch is located inside the brake fluid reservoir tank and causes the brake system warning light on the combination meter to come on when the fluid level has dropped below the predetermined level.

The switch assembly consists of a reed switch (normally open) and a permanent magnet that is incorporated in a float.

When the brake fluid level is normal, the float is far above the reed switch, so the force of the magnet is unable to act on the reed switch. The warning light circuit, therefore, remains open.

When the brake fluid level drops to a level approximately 20 mm (0.79 in) below the maximum level and the float lowers accordingly, the magnet aligns with the reed switch, activating the reed switch contact. The warning light then comes on to warn the driver of the situation.

The warning light may, although momentarily, illuminate even when the brake fluid level is normal if the vehicle tilts or swing largely.

BR-00147

(1) Warning light

(2) Reed switch

(3) Permanent magnet

BRAKE BOOSTER

BRAKE

3. Brake Booster

The brake booster is a tandem type that uses two diaphragms.

By utilizing the differential pressure between the intake manifold vacuum and atmospheric pressure, a high braking force can be obtained even when the pedal depressing effort is small.

The brake booster is installed between the brake pedal and master cylinder. This contributes to improve the response to the brake pedal. If it fails, the brake servo effect is lost requiring a larger pedal effort, however, the braking force is still maintained.

| (3) Steering support beam | |

BRAKE PEDAL

BRAKE

If the brake pedal is pushed rearwards in case of a frontal collision, the brake pedal comes in contact with the catcher.

BR-00355

BRAKE PEDAL

BRAKE

If the brake pedal is pressed further, the brake pedal will come apart from the pedal side bracket.

The brake pedal will move along the brake catcher.

By letting the brake pedal to move down along the catcher, the rearward movement of the brake pad is controlled.

(1) Mounted position before collision

(2) Brake pedal pad position after a collision on a vehicle without a rearward movement control mechanism

PARKING BRAKE

PARKING BRAKE

1. Parking Brake

The parking brakes are applied by manually operating the lever to mechanically control the rear wheels through a cable.

Each rear disc brake rotor contains a drum brake mechanism which is used exclusively for the parking brake.

PB-00055

PARKING BRAKE

PARKING BRAKE

A: OPERATION

1. SETTING

When the parking brake lever is pulled, the shoe actuating lever to which the end of the parking brake cable is connected turns the strut in direction "F" around point "P".

The strut then presses the brake shoes A and B against the drum. These brake shoes utilize a floating design and are movably supported by hold-down pins. The force applied to brake shoe A and the reaction force "F" applied to the brake shoe B via point "P" press them against the brake drum.

PB-00051

TILT STEERING COLUMN

POWER ASSISTED SYSTEM (POWER STEERING)

1. Tilt Steering Column

A: TILT MECHANISM

- The steering wheel vertical position can be adjusted within a 38 mm (1.50 in) range by using the tilt lever to unlock the steering column and lock it again at the desired position.

PS-00470

- (1) Tilt steering column
- (2) Tilt lever
- (3) 23 mm (0.91 in)
- (4) 15 mm (0.59 in)

B: ENERGY-ABSORBING MECHANISM

- To absorb the backward movement energy generated in the engine compartment in the event of a frontal collision, a press-fitted pipes type steering column jacket has been adopted. When an impact load exceeding a certain level is applied to the steering column, jacket A slides on jacket B. Since jacket B is press-fitted in jacket A, friction generated between them absorbs the impact. The column bending load is supported by the press-fitted jackets.
- Another measure to alleviate impact on the driver in the event of a collision is the ripping plate, which is located between the steering column and the tilt bracket attached to the steering support beam. When a large impact load is applied to the steering column, the ripping plate is deformed and torn progressively. The impact energy is absorbed during this process.

TILT STEERING COLUMN

POWER ASSISTED SYSTEM (POWER STEERING)

C: STEERING SUPPORT BEAM

- The steering column is held in position by a support beam, which is installed crosswise in the vehicle body at a level close to the steering wheel to reduce the overhang distance of the steering wheel from the supporting point of the column. The steering shaft upper bearing is also located close to the steering wheel to increase supporting efficiency as well as to minimize vibration of the steering wheel.

PS-00475

(1) Steering support beam

POWER STEERING SYSTEM

POWER ASSISTED SYSTEM (POWER STEERING)

2. Power Steering System

A: HYDRAULIC SYSTEM

- The fluid pump is directly driven by the engine through a belt.
- The fluid flow is maintained almost constant regardless of change in the engine speed by the function of the flow control valve. The flow-regulated fluid is delivered to the control valve through hose A.
- When the steering wheel is turned, the rotary control valve connected to the pinion shaft opens the hydraulic circuit corresponding to the direction in which the steering wheel is turned. The fluid then flows into chamber A or B via pipe A or B.
- The fluid pressure in chamber A or B acts on the rack piston in the same direction as the rack shaft is moved by rotation of the steering wheel. This helps reduce the effort required of the driver to operate the steering wheel.
- Movement of the rack piston causes the fluid in the other chamber to return to the reservoir tank via pipe A or B, control valve, and hose B.
 - As the steering shaft is connected to the pinion shaft mechanically via the rotary control valve, the steering system can operate as a manual system even if the hydraulic system becomes inoperative.
 - To control the maximum fluid pressure, a relief valve is built into the fluid pump to prevent build-up of excessive fluid pressure.
- Since a damper valve is provided in the fluid passage, the steering stability in straight forward direction is improved and kickback is reduced.

POWER STEERING SYSTEM

POWER ASSISTED SYSTEM (POWER STEERING)

B: GEARBOX ASSEMBLY

1. POWER CYLINDER

The gearbox integrates the control valve and power cylinder into a single unit. The rack shaft serves as a power cylinder piston. The rotary control valve is located around the pinion shaft.

The rotary control valve and power cylinder are connected to each other by two hydraulic fluid pipes.

PS-00626

- (1) Piston
- (2) Rack shaft
- (3) Cylinder

- (4) Power cylinder
- (5) Pinion shaft
- (6) Control valve

POWER STEERING SYSTEM

POWER ASSISTED SYSTEM (POWER STEERING)

2. ROTARY CONTROL VALVE

The rotary control valve consists of a rotor (which rotates together with the steering shaft), a pinion (which is connected to the rotor and torsion bar), and a sleeve (which rotates together with the pinion). The rotor and sleeve have grooves C and D, respectively, which form fluid passages V_1 through V_4 .

The pinion is in mesh with the rotor with adequate clearance, which enable the rack to be moved manually by rotating the steering shaft (fail-safe feature).

PS-00011

| (10) Groove C | (B) Cross-sectional view B (pinion-to-rotor engagement) |
| (11) Groove D | |

POWER STEERING SYSTEM

POWER ASSISTED SYSTEM (POWER STEERING)

- Principle of operation

When the torsion bar is twisted by a rotational force applied to the steering wheel, the relative position between the rotor and sleeve changes. This changes the cross-sectional area of fluid passages V_1 , V_2 , V_3 and V_4 . The fluid passages are thus switched and the fluid pressure is controlled in accordance with the operation of the steering wheel.

- When no steering force is applied:

The rotor and sleeve are held at the neutral position. Fluid passages V_1 , V_2 , V_3 and V_4 , which are formed by grooves C and D are open equally. Under this condition, the fluid from the pump returns to the reservoir tank so that neither fluid pressure builds up nor the rack piston moves in the power cylinder.

PS-00012

- (6) V_4

- (7) From fluid pump
- (8) To A
- (9) To B

POWER STEERING SYSTEM

POWER ASSISTED SYSTEM (POWER STEERING)

- When steering force is applied:

When the steering wheel is turned to the right, for example, fluid passages V_1 and V_3 are opened while fluid passages V_2 and V_4 are nearly closed.

At this point, the fluid pressure in chamber A of the power cylinder increases depending on the degree of closure of fluid passages V_2 and V_4 so that the rack piston moves to the right. The fluid in chamber B, on the other hand, is drained through fluid passage V_3 into the reservoir tank.

PS-00013

- (2) Chamber B
- (3) V_1

- (4) V_2
- (5) V_3
- (6) V_4

- (7) From fluid pump
- (8) To A
- (9) From B

- Fail-safe function

If fluid pressure fails to build up due to, for example, a broken fluid pump drive belt, the steering wheel rotating torque is transmitted from the valve rotor to the pinion through mechanical engagement between them.

POWER STEERING SYSTEM

POWER ASSISTED SYSTEM (POWER STEERING)

3. DAMPER VALVE

The damper valve is incorporated in the control valve body and is placed in the fluid passage at between the rotary control valve and the power cylinder chamber. Since the damper valve limits rapid flow of fluid caused by external force, the steering stability in straight forward direction is improved and kickback is reduced.

PS-00685

- (A) To control valve
- (B) To chamber A or B

POWER STEERING SYSTEM

POWER ASSISTED SYSTEM (POWER STEERING)

C: FLUID PUMP AND RESERVOIR TANK

The fluid pump is a vane type driven by the engine via belt.

The reservoir tank is mounted on the vehicle body.

The fluid pump incorporates the flow control valve and relief valve, each performing the following functions:

- The flow control valve regulates the flow rate of discharged fluid to a constant level irrespective of the engine speed.
- The relief valve protects the system from excessively high pressures that may occur, for example, when the steering wheel is turned all the way.
- To stabilize the fluid temperature, an oil cooler is installed between the reservoir tank and gear-box.

PS-00627

POWER STEERING SYSTEM

POWER ASSISTED SYSTEM (POWER STEERING)

- The fluid pump is belt-driven by the engine. The fluid flow is controlled according to the engine speed so that an adequate steering resistance is given during high-speed operation. The fluid pump is a variable capacity type vane pump whose delivery rate per rotation decreases as the engine speed increases. The pump is integral with a pump control valve and relief valve.
- The vane pump consists of a rotor, a cam ring, and 11 vanes. When the rotor rotates, the vane in each slot of the rotor is moved out by centrifugal force in radial directions and pressed against the cam ring. The fluid from the suction port is confined in chambers formed between two adjacent vanes and carried to the discharge port. Since the cam ring is movable in relation to the rotor, the volume of each chamber is variable. This enables the delivery rate per rotation of the pump to be changed.

- (1) Suction
- (2) Vane
- (3) Rotor
- (4) Cam ring
- (5) Discharge

PS-00016

POWER STEERING SYSTEM

POWER ASSISTED SYSTEM (POWER STEERING)

● Flow control

The variable capacity pump changes its delivery rate per rotation by changing the degree of eccentricity of the cam ring according to its rotating speed (engine speed).

PS-00628

|----------------|--|
| (1) Fluid flow | (5) Mid-speed |
| (2) Pump speed | (6) High-speed |
| (3) Idling | (7) Delivery rate per unit time |
| (4) Low-speed | (8) Delivery rate per rotation of pump |

NOTE:

In the following description, pump speed ranges will be indicated using the speed points A through D shown in the drawing above.

POWER STEERING SYSTEM

POWER ASSISTED SYSTEM (POWER STEERING)

Low-range-speed operation (A — B range)

In this speed range, as well as in all the other speed ranges, two different pump discharge pressures are always applied to the control valve; one is directly led from the discharge port to the left end of the valve and the other is led through an orifice (variable orifice) to the right end of the valve. Since the orifice has a pressure reducing effect, the latter pressure is lower than the former.

When the pump is operating at a low speed, its discharge pressure is also low, resulting in only small difference between the two pressures. In this condition, the valve stays pushed leftward by the spring, allowing the non-pressurized tank fluid to enter chamber A. To chamber B, on the other hand, the orifice-reduced discharge pressure is applied, so the cam ring is pushed leftward by the cam ring spring. This makes the eccentricity of the cam ring a maximum and, therefore, the delivery rate per rotation of the pump becomes a maximum.

PS-00261

| (2) Reservoir tank fluid | (7) Pressure chamber A |
| (3) Control valve spring | (8) Pressure chamber B |
| (4) Gear box | (9) Cam ring |
| (5) Cam ring spring | |

POWER STEERING SYSTEM

POWER ASSISTED SYSTEM (POWER STEERING)

Mid- to high-range-speed operation (B — D range)

During mid-range speed operation, the pump increases its delivery rate. Since the pressure before passing through the variable orifice increases, the control valve moves rightward, overcoming the tension of the control valve spring. This movement of the control valve allows the pressure upstream of the variable orifice to be directed to chamber A after being adjusted to a necessary pressure* by the port opening area created by the control valve. On the other hand, chamber B receives the reservoir pressure (suction pressure). This means that the pressure in chamber A is higher than that in chamber B. As a result, the cam ring moves rightward against the tension of the cam spring. This causes the delivery rate per rotation of the pump to be reduced, so that the flow rate of the fluid to the steering gear box decreases accordingly.

The above control is performed when the pump is operating at a speed in the B — D range.

* The “necessary pressure” for chamber A is a pressure required to move the cam ring to the position corresponding to each predetermined flow rate (pump delivery rate). The pressure is obtained by changing the port opening area appropriately through displacement of the control valve. The displacement of the control valve is determined by how much the pressure before the variable orifice is different from that after the orifice.

HEATER SYSTEM

HVAC SYSTEM (HEATER, VENTILATOR AND A/C)

1. Heater System

A: GENERAL

- A semi-center type integrated air conditioning unit is used, where a high performance heater core and an evaporator core are placed in front and rear of the unit. While ensuring sufficient leg space at the front passenger's seat, resistance to air flow in the air passage is reduced, and the air conditioning system offers a low noise and comfortable environment in all seasons through its functions such as heating, air conditioning, ventilating and defrosting.
- On models with automatic air conditioning, a left/right independent temperature control system is introduced to enable the driver and passenger choose a desirable temperature setting individually.

HVAC SYSTEM (HEATER, VENTILATOR AND A/C)

C: CONTROL PANEL

- The control panel is incorporated into the center panel. To improve the appearance of the interior, the panel is integrated with the audio panel except for models with some audio equipment variations.
- A rear window defogger switch is located in the control panel.

1. MODELS WITH MANUAL AIR CONDITIONING

- The control panel uses three large-diameter, dial type switches for easy operation and good visual recognition.

- (1) Air flow control dial:
This switch allows selecting any of the five air flow modes.

AC-00127

- (2) Fan speed control dial:
This switch allows turning on/off the blower and selecting any of the four blower speeds.

HEATER SYSTEM

HVAC SYSTEM (HEATER, VENTILATOR AND A/C)

0 1 2 3 4

AC-00126

- (3) Temperature control dial:
This switch allows step-less adjusting of the temperature of air delivered through ventilators.
- (4) Rear window defogger switch:
This switch activates the rear defogger. When the switch is left on, a timer keeps the defogger activated for 15 minutes and then turns it off automatically.
- (5) FRESH/RECIRC switch:
This switch allows selecting either cabin-air-recirculation or fresh-air-introduction.
- (6) Air conditioning switch:
This switch turns on or off the air conditioning compressor.

2. MODELS WITH AUTOMATIC AIR CONDITIONING

- A motor driven actuator is used for air outlet switching, driver and passenger side temperature control, and FRESH/RECIRC switching.
- A large sized LCD panel which excels in visibility is used for the control panel.
- To eliminate errors due to heat, the cabin temperature sensor is moved from the control panel to the console side panel.

- (1) Fan speed control switch:
In automatic air conditioning mode, the system controls the blower speed automatically in accordance with sensor signals.
In manual air conditioning mode, this switch allows selecting any of the six blower speeds.
- (2) Air flow control switch:
This switch allows selecting any of the four air flow modes.

HEATER SYSTEM

HVAC SYSTEM (HEATER, VENTILATOR AND A/C)

AC-00130

- (3) FRESH/RECIRC switch:
This switch allows selecting either cabin-air-recirculation or fresh-air-introduction.
- (4) A/C switch:
This switch turns on or off the air conditioning compressor.
- (5) Rear window defogger switch:
This switch activates the rear defogger. When the switch is left on, a timer keeps the defogger activated for 15 minutes and then turns it off automatically.
- (6) Temperature control dial (left: driver's seat, right: passenger's seat):
By turning the left or right dial the temperature of air delivered through ventilators can be adjusted individually at the driver's side and passenger's side. When the dial is turned clockwise the temperature setting rises, and when the dial is turned counterclockwise the setting becomes lower.
Temperature setting can be changed in a range between 18 and 32°C in 0.5°C steps.
- (7) Defroster switch:
When this switch is turned ON the system enters the defroster mode.
- (8) OFF switch:
All functions are disabled.
- (9) AUTO switch:
When this switch is turned ON the system enters auto air conditioning mode and automatically controls the blower fan speed, air outlet, fresh/recirculation switching, and compressor operation.

HEATER SYSTEM

HVAC SYSTEM (HEATER, VENTILATOR AND A/C)

D: HEATER AND COOLING UNIT

- Having an evaporator core at the front and a heater core at the rear, this single unit combines both heating and cooling functions.
- The heater and cooling unit incorporates mode doors for creating different air flow modes and an air mix door for mixing heated air and outside air.
- On models with automatic air conditioning, the inside of the heater and cooling unit is separated into left and right parts so that the driver and passenger can individually control the temperature.
- In models with an automatic air conditioning, the mode doors and air mixing door are moved by electric-motor-driven actuators.
In models with a manual air conditioning system, the air mix door is moved by a linkage cable.

AC-00947

1. SPECIFICATIONS

Heater core size	Heat output
264 × 110 × 27	5200 W

HEATER SYSTEM

HVAC SYSTEM (HEATER, VENTILATOR AND A/C)

2. DESIGN FEATURES FOR EACH AIR FLOW MODE

1) Ventilation (FACE) mode

- The passage leading air from the evaporator to the ventilation duct is made straight to reduce air flow resistance.
- When the air temperature is necessary to be adjusted, heated air is blown at right angles against the flow of cool air from the evaporator. This allows the airs to mix thoroughly.

- (1) Evaporator
- (2) Heater core

2) Foot/face (BILEVEL) mode

- The air that has flown through the evaporator is divided into two directions. Part of this air flows through the heater core and becomes warm air. The rest of the air goes to the outlet as cool air, however, this is mixed with the warm air from the heater core. The mixed air then flows to the ventilation and heater ducts.

- (1) Evaporator
- (2) Heater core

HEATER SYSTEM

HVAC SYSTEM (HEATER, VENTILATOR AND A/C)

3) Heating (FOOT) mode

- The air that has flown through the evaporator is heated at the heater core and then flows to the heater ducts.
- To defog the windshield, the defroster door is slightly open and warm air is also sent to the defroster (DEF) duct.
- The side ventilation grills ventilate air always.

- (1) Evaporator
- (2) Heater core

4) Defroster (DEF) mode

- Air passages are designed in such a way that air flow resistance is minimized and defrosting performance is maximized.
- The air passages toward the defroster (DEF) outlet is long enough to ensure a same airflow rate at all defroster outlets.
- The side ventilation grills ventilate air always.

- (1) Evaporator
- (2) Heater core

HEATER SYSTEM

HVAC SYSTEM (HEATER, VENTILATOR AND A/C)

5) Defroster (DEF) /Heating (FOOT) mode

- The air from the evaporator flows through the heater core and the warmed air flows to the defroster (DEF) duct and foot duct to defog the windshield while sending warm air to the legs.
- The air directed to the defroster duct flows out from the front and side defroster ducts to defog the windows.
- The side ventilation grills ventilate air always.

- (1) Evaporator
- (2) Heater core

E: BLOWER UNIT

- The blower unit uses a low-noise-type motor.

HEATER SYSTEM

HVAC SYSTEM (HEATER, VENTILATOR AND A/C)

F: FILTER

- Clean air filters are available for all models as dealer option. They can remove dust, cigarette smoke particles and other similar impurities in the air.

G: DUCT

- The ventilation duct and defroster duct are located behind the instrument panel. Both the ducts have been modified in the shape to reduce air flow resistance.
- Defrosting air flow is divided at the center, so that air can flow out evenly through a wide center defroster as well as right and left side defrosters.

COOLING SYSTEM

HVAC SYSTEM (HEATER, VENTILATOR AND A/C)

2. Cooling System

A: COMPRESSOR

As two scrolls (one movable and other fixed) are engaged, a crescent chamber is formed between multiple contact points. The movable scroll cannot rotate on its own axis but orbits instead, so the operating chamber moves inwards while its capacity is reduced. Intake, compression and discharge take place simultaneously at multiple operation chambers, and compressed refrigerant is sent from the discharge hole at the center to the oil separator and then separated in to refrigerant gas and oil before it is output from the discharge port.

AC-00874

- | | |
|-------------------------|---------------------------|
| (1) Rear housing | (6) Rotor: movable scroll |

COOLING SYSTEM

HVAC SYSTEM (HEATER, VENTILATOR AND A/C)

1. PRESSURE RELIEF VALVE

This valve opens if the pressure of the high-pressure refrigerant gas rises to a dangerously high level to release part of refrigerant into the atmosphere, thus protecting the compressor. The valve is designed to limit the amount of released gas to the necessary minimum.

- Valve opening pressure: above 3.43 MPa (35.0 kgf/cm²)
- Valve closing pressure: above 2.75 MPa (28.1 kgf/cm²)
- Valve wide open pressure: below 4.14 MPa (42.2 kgf/cm²)

- (1) Housing
- (2) Valve
- (3) Holder

- (4) Spring
- (5) Plate

Operating characteristics

- (A) Pressure MPa (kgf/cm²)
- (B) Leakage l/min

COOLING SYSTEM

HVAC SYSTEM (HEATER, VENTILATOR AND A/C)

B: COOLING UNIT

The heater unit and cooling unit are integrated into a single heater and cooling unit.

The cooling section components of this unit include an evaporator, expansion valve, and case.

AC-00947

1. EVAPORATOR

The evaporator is a laminated type.

When a low-pressure, low-temperature refrigerant is sprayed by the expansion valve into the evaporator, it evaporates and cools the evaporator surfaces.

The cabin air is drawn by the blower and cooled down as it flows over the evaporator. The cooled air then flows passing through the heater unit and delivered into the cabin through vent outlets.

AC-00856

COOLING SYSTEM

HVAC SYSTEM (HEATER, VENTILATOR AND A/C)

2. EXPANSION VALVE

The expansion valve regulates the flow of refrigerant such that heat exchange takes place optimally.

The expansion valve performs two functions; it sprays the high-pressure refrigerant from the condenser using a throttle valve, and it regulates the amount of the spray by changing opening of the throttle valve.

The expansion valve consists of such main components as a heat sensing cylinder, diaphragm, ball valve, spring, and adjusting screw.

- | | |
|---------------------------|---|
| (1) Ball valve | (A) Refrigerant flow |
| (2) Shaft | (B) From evaporator (low-pressure side) |
| (3) Heat sensing cylinder | (C) To compressor |
| (4) Diaphragm | (D) To liquid tank |
| | (E) To evaporator (high-pressure side) |

The heat (temperature) sensing cylinder is held in contact with the evaporator outlet pipe so that a pressure corresponding to the sensed temperature may be applied to the chamber above the diaphragm. There is a pressure equalizing hole which communicates with the chamber below the diaphragm to transmit changes in the refrigerant pressure to the chamber. The ball valve is linked with the diaphragm and moves according to changes in the balance between the force applied to the diaphragm and the tension of the spring.

COOLING SYSTEM

HVAC SYSTEM (HEATER, VENTILATOR AND A/C)

C: CONDENSER

The condenser is a newly developed subcooling condenser that integrates a multi-flow type condenser and a modulator (gas-liquid separator) into a single unit. The condenser has a high heat-exchange efficiency.

- (1) Liquid tank
- (2) Urethane

1. SUBCOOLING CONDENSER

The new subcooling condenser has a subcooling section where part of the refrigerant that remains in gas form is cooled and reduced into liquid form. This enables almost 100% of the refrigerant to be re-liquefied.

- (1) Liquid tank

- (A) Suction
- (B) Discharge

COOLING SYSTEM

HVAC SYSTEM (HEATER, VENTILATOR AND A/C)

D: PRESSURE SWITCH

The pressure switch is a high-pressure side component of the refrigeration cycle (cooling cycle). It consists of a diaphragm that receives refrigerant gas pressure, a snap plate, a rod, contacts that open both when the gas pressure is too low and when it is too high, and a switch that operates at mid-pressure.

The pressure switch plays the following roles:

- Prevents “no-gas” operation due to leakage (when gas pressure is too low)
- Protects the system against abnormally high refrigerant pressure (when gas pressure is too high)
- Detects compressor load (mid pressure contact: electric cooling fan output control)

- | | |
|-------------------------------|----------------------------------|

	Radiator and condenser fan control	Performed by ECM		
Diagnosis function	The auto A/C control module has a sensor and actuator diagnosis function.			
Other controls	Manual adjustment possible at maximum heating and maximum cooling positions			

AUTOMATIC AIR CONDITIONING

HVAC SYSTEM (HEATER, VENTILATOR AND A/C)

B: CONTROL PANEL

<Ref. to AC-7, MODELS WITH AUTOMATIC AIR CONDITIONING, CONTROL PANEL, Heater System.>

C: IN-VEHICLE SENSOR

The in-vehicle sensor detects the cabin temperature and sends an electric signal corresponding to the temperature to the A/C control module.

This sensor consists of an aspirator and a thermistor, the resistance of which changes in inverse proportion to the temperature. The aspirator operates by a vacuum generated in the heater unit (only when the blower unit is turned on).

- (A) Temperature
- (B) Resistance

AUTOMATIC AIR CONDITIONING

| (2) Aspirator duct | (5) Cabin air inlet |
| (3) Heater unit | (A) Cabin air |

AUTOMATIC AIR CONDITIONING

HVAC SYSTEM (HEATER, VENTILATOR AND A/C)

D: AMBIENT SENSOR

The ambient sensor uses a thermistor to detect the ambient temperature and outputs a signal corresponding the detected temperature to the auto A/C control module.

The thermistor is covered with a plastic molding to increase its thermal capacity, thus preventing it from being too sensitive to rapid changes in the temperature and enabling the sensor to output an average ambient temperature.

- (A) Temperature
- (B) Resistance

The ambient sensor is attached to the radiator lower panel at the portion where the radiator panel is located in such a way that it is exposed to outside air most efficiently.

AC-00712

- (1) Ambient sensor

AUTOMATIC AIR CONDITIONING

HVAC SYSTEM (HEATER, VENTILATOR AND A/C)

E: SUN-LOAD SENSOR

The sun-load sensor uses a photodiode which can convert change in the intensity of solar radiation into change in the electric current. The output signal of the sensor is sent to the auto A/C control module.

Sun-load sensor characteristic

(A) Solar radiation

(B) Photoelectric current

The sun-load sensor is attached to the front defroster grill.

(1) Sun-load sensor

AUTOMATIC AIR CONDITIONING

HVAC SYSTEM (HEATER, VENTILATOR AND A/C)

F: EVAPORATOR SENSOR

The evaporator sensor detects the temperature of the air that has passed over the evaporator and transmits a signal corresponding to the temperature to the auto A/C control module.

- (A) Temperature
- (B) Resistance

- (1) Evaporator sensor connector

AUTOMATIC AIR CONDITIONING

HVAC SYSTEM (HEATER, VENTILATOR AND A/C)

G: AIR MIX DOOR ACTUATOR

Air mix door actuators are installed at left and right of the heater and cooling unit, and they move the left and right air mix doors independently to the proper position in response to signals from the auto A/C control module. This enables the driver and passenger to control the temperature individually.

AC-01123

- (1) Air mix door actuator (driver's seat)
- (2) Air mix door actuator (passenger's seat)

AUTOMATIC AIR CONDITIONING

HVAC SYSTEM (HEATER, VENTILATOR AND A/C)

H: MODE DOOR ACTUATOR

The mode door actuator incorporates an electric motor which turns in one or the other direction in response to signals from the auto A/C control module. The motion of the electric motor is transmitted to each mode door via a linkage and moves the door to the position appropriate for the selected air flow mode.

- (1) Mode door actuator
- (2) Air mix door actuator

AUTOMATIC AIR CONDITIONING

HVAC SYSTEM (HEATER, VENTILATOR AND A/C)

I: FRESH/RECIRC DOOR ACTUATOR

The FRESH/RECIRC door actuator incorporates an electric motor which turns in one or the other direction in response to a signal from the auto A/C control module. The motion of the electric motor is transmitted to the FRESH/RECIRC door via a linkage to move the door to the outside-air introduction or cabin-air-recirculation position.

AC-00955

(1) FRESH/RECIRC door actuator

J: FAN CONTROL AMPLIFIER

The fan control amplifier uses a MOS* type field effect transistor. This amplifier steplessly regulates the blower motor voltage (in the range between approximately 3V and 12V) in response to gate voltage signals issued by the auto A/C control module.

Since this fan control amplifier features very small voltage drop, it can handle the maximum voltage for the maximum blower speed without need for a high-voltage relay.

*MOS = metal oxide semiconductor

AC-00720

AIRBAG SYSTEM

AIRBAG SYSTEM

1. Airbag System

A: GENERAL

1. SRS AIRBAG

The SRS airbags supplement the seat belts which restrain the body if the driver or passenger is endangered by a severe impact to the front of the vehicle.

If an impact whose magnitude exceeding the preset value is applied to the vehicle, the airbags inflate immediately to prevent the driver and front seat passenger being hit against the steering wheel, instrument panel or windshield.

A two-staged inflator whose airbag inflation speed is changed according to the magnitude of the impact is used.

2. SRS SIDE AIRBAG

The SRS side airbag supplements the seat belts which restrain the body if the driver or passenger is endangered by a severe impact to the side of the vehicle.

If an impact whose magnitude exceeding the preset value is applied to the side of the vehicle, the side airbags inflate immediately to soften the impact to the driver or front seat passenger especially at their chest area.

3. SRS CURTAIN AIRBAG

The SRS curtain airbag supplements the seat belts which restrain the body if the driver or passenger is endangered by a severe impact to the side of the vehicle.

If an impact whose magnitude exceeding the preset value is applied to the side of the vehicle, the curtain airbag inflates immediately to soften the impact to the passengers especially at their head area.

AIRBAG SYSTEM

AIRBAG SYSTEM

4. SEAT BELT PRETENSIONER

The seat belt pretensioner improves efficiency of body restraint by retracting the seat belt immediately if the driver or passenger is endangered by a severe impact to the front of the vehicle.

SYSTEM COMPONENTS AND OPERATION

AIRBAG SYSTEM

B: COMPONENTS

Name	Major function	Location
Airbag control module	<ul style="list-style-type: none"> ● Senses impact and judges its magnitude by means of a safety sensor and G sensor built inside. ● Serves as supplementary power supply if the battery voltage is lowered for some reason. ● Directs airbags to inflate. ● Performs self diagnosis of the airbag system. 	Inside center console.
Driver's seat air-bag module	Protects the driver's head and upper body to minimize injury in an event of frontal collision.	Stowed inside the pad at the center of the steering wheel.
Passenger's seat airbag module	Protects the passenger's head and upper body to minimize injury in an event of frontal collision.	Stowed inside the instrument panel at the front passenger's side.
Driver's seat side airbag module	Protects the driver's upper body to minimize injury in an event of side collision.	Stowed inside the driver's seat backrest.
Passenger's seat side airbag module	Protects the front passenger's upper body to minimize injury in an event of side collision.	Stowed inside the front passenger's seat backrest.
Curtain airbag module	Deploys together with the side airbag to protect the driver's or passenger's head and minimize injury in an event of side collision.	Stowed inside at left and right sides from the A pillars through the upper part of C pillars.
Steering roll connector	Provides electrical connection between the vehicle side airbag harness and steering wheel.	Between the combination switch and steering wheel.
Seat belt pretensioner	Retracts the seat belt immediately to restrain the body of front seat passengers in an event of a frontal collision.	Lower part of left and right B pillars.
Front sub sensor	Detects the impact in an event of a frontal collision and outputs a deceleration signal to the control module.	In front of left and right front frames.
Side airbag sensor	<ul style="list-style-type: none"> ● Senses impact and judges its magnitude in an event of a side collision by means of a safety sensor and G sensor built inside. ● Performs self diagnosis of the airbag system. 	Inside the left and right B pillars.
Curtain airbag sensor	<ul style="list-style-type: none"> ● Senses impact and judges its magnitude in an event of a side collision by means of a safety sensor and G sensor built inside. ● Performs self diagnosis of the airbag system. 	In front of rear left and right wheel arches.
Airbag warning light	<ul style="list-style-type: none"> ● Indicates whether the system is normal or abnormal. ● Displays diagnostic trouble codes. 	Inside the combination meter.
Occupant detection control module	<ul style="list-style-type: none"> ● Decides whether an adult, child, or is nobody is sitting in the seat, based on the occupant detection sensor output. ● Performs self diagnosis of the occupant detection system. 	Beneath the passenger's seat cushion.
Loadcell sensor	Detects the load on the seat applied by the passenger.	On the passenger's seat slide rail.
Passenger's seat airbag ON/OFF indicator	Indicates whether the deployment of the passenger's seat airbag is allowed or not, based on the decision of the occupant detection system.	Center of the instrument panel at the clock area.
Buckle switch	Detects whether the seat belt is fastened or not.	At the seat belt buckle.
Seat position sensor (LH)	Detects the fore-aft position of the driver's seat and distinguishes the passenger.	On the driver's seat slide rail.

1. AIRBAG CONTROL MODULE

The airbag control module is installed inside the center console and contains a safety sensor, G sensor, ignition judgment circuit, and a backup power supply, etc.

The control module receives electric signals from the safety sensor and electric sensor inside the module and also from the front sub sensor to detect the deceleration of the vehicle and judge whether the airbag and pretensioners should be ignited or not. It also has a self diagnosis function which lights up the airbag warning light in the combination meter if a fault occurs in the system. Diagnostic trouble codes generated by the self diagnosis function are stored in the memory in the module.

To prepare for battery voltage fall in an event of an accident, the control module is provided with a backup power supply.

AB-00689

- **Safety sensor**

Inside of the sensor there is a mass weight, which works as a pendulum; if the sensor detects an impact acceleration exceeding a certain limit, the mass weight in the sensor moves to close the contacts and turn the switch ON.

- **G sensor**

Inside of the sensor there are comb-teeth shaped electrodes; in case of a collision the distance between the electrodes varies by the impact to enable detection of the impact acceleration.

SYSTEM COMPONENTS AND OPERATION

AIRBAG SYSTEM

2. DRIVER'S SEAT AIRBAG MODULE

The driver's seat airbag module is built in the steering wheel pad.

The SRS airbag module assembly cannot be disassembled. The driver's seat airbag module assembly consists of an inflator and airbag, and a steering wheel pad.

AB-00692

- (1) Steering wheel pad
- (2) Airbag

- (3) Inflator

SYSTEM COMPONENTS AND OPERATION

The inflator houses igniters and gas generating agents in a metal container. Igniters and gas generating agents are placed at two locations, and a 2-stage inflator which controls the airbag inflating speed according to the magnitude of impact at a collision is used. If the impact detected by the airbag sensor is equivalent to the level detected at a high speed, sudden collision, the two gas heating agents are ignited simultaneously. If the event of a collision at low or mid speed, the ignition of the 2nd stage gas generating agent is delayed to reduce the output of the inflator. Thus the inflator outputs power suitable for the severity of collision and relieves the impact to the passenger's head or upper body.

Wagon models

AB-00698

(1) Inflator

(2) Airbag

SYSTEM COMPONENTS AND OPERATION

AIRBAG SYSTEM

6. STEERING ROLL CONNECTOR

The steering roll connector is in between the steering column and the steering wheel, and contains a spirally wound flat cable.

The flat cable maintains connection between the airbag module on the steering wheel and the airbag harness even when the steering wheel is turned. Ignition signal from the airbag control module is sent through the roll connector to the driver's seat airbag module.

(1) Flat cable

(2) Airbag module connector

SYSTEM COMPONENTS AND OPERATION

AIRBAG SYSTEM

7. SEAT BELT PRETENSIONER

The driver's and front passenger's seat belt retractors contain a seat belt pretensioner.

The airbag control module controls the operation of the seat belt pretensioner. If the front sub sensor and the sensors inside the airbag control module detect an impact exceeding a specified level, the driver's seat and front passenger's seat airbags are deployed almost simultaneously. Upon receiving signals from the airbag control module the gas generator inside the pretensioners are ignited and the gas pressure retracts the seat belts in a very short time to improve the passenger restraint effect.

If the load placed on a seat belt exceeds the predetermined level, the torsion bar is twisted to allow the seat belt to be pulled out, thus lessening the load imposed on the belt wearer's chest.

Once the seat belt pretensioner has been activated, the seat belt retractor remains locked.

(B) GND

(1) 5 V power

(2) Current communication circuit

(3) G sensor

(4) Oscillator

SYSTEM COMPONENTS AND OPERATION

AIRBAG SYSTEM

9. SIDE IMPACT SENSOR

The side impact sensors (side airbag sensor, curtain airbag sensor) are installed at the bottom of the center pillars and the rear quarter pillars.

If the sensor in the side impact sensor detects an impact exceeding the specified level from the side, it sends a signal which is used for airbag system deployment judgment to the airbag control module.

Signals from the side airbag sensors are effective for both the side airbags and curtain airbags, while signals from the curtain airbag sensors detect impact to the rear seat sides and let only the curtain airbags deploy.

AB-00702

(1) OR

10. AIRBAG WARNING LIGHT

The airbag warning light is located inside the combination meter. It illuminates if a poor connection in the airbag circuit occurs, or if the airbag control module detects an abnormal condition. When the airbag system is normal, this light comes on when the ignition switch is turned ON and then goes out about 6 seconds later.

AB-00704

11. WIRING HARNESS

The airbag harnesses are integrated into the body harness as follows:

- Front sub sensor harness: integrated into the front harness.
- Airbag main harness: integrated into the bulkhead harness.
- Pretensioner and side airbag harnesses: integrated into the rear harness.

AIRBAG CONNECTORS

AIRBAG SYSTEM

3. Airbag Connectors

A: GENERAL

The airbag system uses connectors with a double lock mechanism and an incomplete-coupling-detection mechanism for enhanced reliability. If coupling is incomplete, the airbag warning light comes on in the combination meter.

1. DRIVER'S SEAT AIRBAG MODULE-TO-SEAT BELT PRETENSIONER CONNECTOR

Disconnection:

- 1) Lift the lock button using a thin tipped tool like a miniature screwdriver.

AB-00529

- 2) Pull the connector out from the airbag module.

AB-00528

Connection:

Carefully insert the connector into the airbag module. Push the connector until a "click" is heard from the lock button.

AIRBAG CONNECTORS

AIRBAG SYSTEM

2. AIRBAG MAIN HARNESS-TO-ROLL CONNECTOR, AND PASSENGER'S SEAR AIRBAG MODULE CONNECTOR

(1) Slide lock

Disconnection:

- 1) Press the slide lock inwards.

- 2) While the slide lock pressed in, disconnect the connector (A).

Connection:

Insert the female side connector half into the other until a "click" is heard.

AIRBAG CONNECTORS

AIRBAG SYSTEM

3. SIDE AIRBAG MODULE AND CURTAIN AIRBAG MODULE CONNECTORS

- (1) Slide lock
- (2) Lock arm

Disconnection:

- 1) Push in and hold the lock arm (A), then pull the slide lock (B).

- 2) While the slide lock pulled and held (B), release the lock arm (C).

AIRBAG CONNECTORS

AIRBAG SYSTEM

3) While the slide lock pulled and held (B), disconnect the connector (D).

Connection:

Insert the female side connector half into the other until a “click” is heard.

4. AIRBAG HARNESS-TO-BODY HARNESS, OCCUPANT DETECTION CONTROL MODULE-TO-BODY HARNESS, AND SEAT BELT BUCKLE SWITCH CONNECTORS

Disconnection:

Hold slide lock (A) moved in the direction of the arrow, then pull the female connector in the direction of the arrow.

Connection:

Push the connector (A) into the male connector carefully until a “click” is heard.

AB-21

AIRBAG CONNECTORS

AIRBAG SYSTEM

5. FRONT SUB SENSOR, SIDE AIRBAG SENSOR, CURTAIN AIRBAG SENSOR, AND SEAT POSITION SENSOR (LH) CONNECTORS

Disconnection:

Holding the outer part (A), pull the connector in the direction of the arrow.

Connection:

Holding the inner part, push the connector into the socket carefully until a “click” is heard. Do not hold the outer part (A) as it moves back during connection of the connector.

SEAT BELT LIGHT

SEAT BELT SYSTEM

2. Seat Belt Light

A: SEAT BELT WARNING LIGHT

A seat belt warning light is provided for the front seats to warn the passengers to fasten the seat belt.

The driver's seat warning light is located in the combination meter, and the front passenger's seat belt warning light and rear seat belt fastening indicator are located at the center of the map light lens.

SB-00170

(1) Driver's seat warning light

(2) Passenger's seat warning light

B: SEAT BELT ALARM SYSTEM

1. GENERAL

When the ignition switch is turned ON, the seat belt warning light in the combination meter illuminates for 6 seconds and the warning buzzer sounds to warn the driver to fasten the seat belt. The seat belt warning light turns off and the buzzer ceases when the seat belt tongue plate is inserted into the seat belt buckle.

If the driver starts the vehicle without fastening the seat belt, the warning light illuminates or blinks and the buzzer sounds to warn the driver to fasten the seat belt. The seat belt warning light turns off and the buzzer ceases when the seat belt tongue plate is inserted into the seat belt buckle.

The passenger's seat side is also provided with a seatbelt alarm system, which turns ON the passenger's seat belt warning light when it detects a passenger through the passenger sensor (load cell sensor). If the driver starts the vehicle without fastening the seat belt, the seat belt warning light illuminates or blinks and the buzzer sounds to warn the passenger to fasten the seat belt.

2. SYSTEM STATUS TRANSITION

Alarms that are given with the seat belt warning light and buzzer vary in accordance with the vehicle speed and seat belt fastened/unfastened state. (The alarm system can warn the driver and the passenger individually, however, if both seat belts are not fastened, the buzzer will give priority to warn the driver.)

1) When the ignition switch is turned ON (with the seat belt not fastened), the seat belt warning light flashes for 6 seconds. If the seat belt is not fastened within this period, an alarm is given with a buzzer sound*.

*: The buzzer sounds only when the driver's seat belt is not fastened.

2) After 6 seconds since the ignition switch is turned ON, the seat belt warning light starts to illuminate or flash for every 15 seconds, and the buzzer will sound if the warning light is flashing.

3) If the seat belt is unfastened again when the vehicle speed is at or over 15 km/h (9 MPH), the seat belt warning light repeats illuminating or flashing, and the buzzer will sound if the warning light is flashing.

3. CUTOFF FUNCTION

The warning given after 6 seconds since the ignition switch is turned ON, and the warning function that activates when the seat belt is unfastened while driving can be optionally cut off. The cutoff function is common for both the driver's seat and passenger's seat, and can be set with the driver's seat buckle switch.

Temporary (TEMP) cutoff

1) How to cut: Repeat fastening and unfastening the driver's seat belt for 3 times within 6 seconds after turning the ignition switch ON. (The setting is changed for both the driver's seat and passenger's seat.)

2) Setting lasts: While the ignition switch is turned ON until it is turned OFF. (The cutoff function is canceled when the ignition switch is once turned OFF.)

Permanent cutoff

1) How to cut: Repeat fastening and unfastening the driver's seat belt for 20 times within 30 seconds after turning the ignition switch ON. Enabling and disabling cutting is done with the same operation. (The setting is changed for both the driver's seat and passenger's seat.)

SEAT BELT LIGHT

SEAT BELT SYSTEM

2) Setting lasts: Until the microprocessor is reset*.

The cutoff function is reset when the battery is removed (battery positive terminal disconnected) or when the body integrated unit is removed. The cutting function may also be reset when the engine is cranked with low battery voltage.

WIPER AND WASHER SYSTEMS

WIPER AND WASHER SYSTEMS

1. Wiper and Washer Systems

A: GENERAL

1. FRONT WIPER

- 1) The front wiper is of a tandem type featuring a wide wiping area. The blade is installed to the arm by means of U-hook joint to improve serviceability.
- 2) The front wiper operates in the HI and LOW speed modes and the INTERMITTENT mode. The operation modes can be selected by turning the wiper switch incorporated in the combination switch.
- 3) In the INTERMITTENT mode, the intermittent unit installed behind the combination switch controls the front wiper operation interval.
- 4) The front wiper system uses a modular construction in which the wiper motor forms an integral part of the linkage. The motor is installed on the body through rubber mounting.

WW-00159

- 5) The size of the motor is minimized by changing the stator shape, coil windings and the magnet.

WIPER AND WASHER SYSTEMS

WIPER AND WASHER SYSTEMS

6) The mounting bracket is modified. The bracket of the wiper link assembly bracket area breaks if it receives a force exceeding a certain level to absorb the impact in case of a traffic accident, etc.

WW-00228

(1) Bracket

WIPER AND WASHER SYSTEMS

WIPER AND WASHER SYSTEMS

7) The driver's side wiper arm is angled to disperse the force applied to the wiper arm by the airflow. A part of the dispersed force acts to press the wiper blade against the windshield helping to prevent the wiper blade being lifted up.

WW-00043

(1) Airflow
(2) Angle of twist

(3) Dispersed force
(4) Windshield

8) When wiper arms are raised in cases such as washing the car, always raise the driver's seat side wiper arm first and then raise the passenger's seat side wiper arm. If the passenger's seat side wiper arm is raised first, this will obstruct the way for the driver's side wiper arm. If forcibly raised in the wrong way, the passenger's side wiper arm may be damaged. When lowering the wiper arms, lower the passenger's side arm first.

WIPER AND WASHER SYSTEMS

WIPER AND WASHER SYSTEMS

2. FRONT WASHER SYSTEM

- 1) The front washer system consists of a washer tank, motor and pump unit, and a pair of nozzles.
- 2) The washer tank is installed behind the front bumper under the left headlight.
- 3) The washer motor and pump unit is installed at the bottom of the washer tank.
- 4) The washer nozzles are installed to the front hood at its rear end and from the under side. Each nozzle has a spray hole.
- 5) Each washer nozzle has a check valve at a location approximately 100 mm (3.94 in) from the nozzle.
- 6) The washer tank is filled to its specified capacity when the fluid level is at the “FULL” mark on the filling pipe. Do not fill washer fluid until its level exceeds the “FULL” mark. The fluid may spill during driving or when replacing the head light bulb.

3. SPECIFICATIONS

Washer tank	Capacity	4.0 ℓ (4.2 US qt, 3.5 Imp qt)		
Wiper motor	Rated voltage	12 V		
	No-load current	4 A or less		
	Speed [at 2.0 N·m (20 kg-cm, 17 in-lb)]	HIGH	56 — 68 rpm	
		LOW	35 — 45 rpm	
	Motor characteristics when bound	HIGH	Torque	25.5 N·m (260 kg-cm, 1.88 ft-lb) or more
			Current	33 A or less
LOW		Torque	31.4 N·m (320 kg-cm, 2.31 ft-lb) or more	
		Current	29.0 A or less	
Wiper blade	Length	Driver side	600 mm (23.62 in)	
		Passenger side	450 mm (17.72 in)	

REAR WIPER AND WASHER

WIPER AND WASHER SYSTEMS

2. Rear Wiper and Washer

A: GENERAL

1. REAR WIPER

- 1) The rear wiper operates over an angle of 168°.

WW-00291

- 2) The rear wiper operates intermittently as shown in the following table only when the wiper switch is in the INT position on AT models.

Selector lever position (AT models only)	Vehicle speed km/h (MPH)	Interval (sec)
		Wagon
Reverse (R)	—	Continuous operation
Other than reverse (R)	0 — 20 (0 — 12.4)	12
	20 — 50 (12.4 — 31.1)	9
	50 — 80 (31.1 — 49.7)	6
	over 80 (49.7)	3

REAR WIPER AND WASHER

WIPER AND WASHER SYSTEMS

2. REAR WASHER SYSTEM

- 1) The front and rear washers share the same washer tank.
- 2) The washer motor and pump unit is installed at the bottom of the washer tank.
- 3) The washer nozzle is installed to the lower part of the roof spoiler. The nozzle has two spray holes.
- 4) The washer nozzle is provided with a check valve, which is located just below it.

3. SPECIFICATIONS

Wiper motor	Rated voltage	12 V	
	No-load current	2 A or less	
	Speed [at 0.5 N·m (5 kg·cm, 4.3 in·lb)]	25 rpm or more	
	Motor characteristics when bound	Torque	8.8 N·m (0.90 kgf·m, 6 ft·lb) or more
		Current	13 A or more
Wiper blade	Length	350 mm (13.78 in)	

HORNS

COMMUNICATION SYSTEM

1. Horns

A: GENERAL

COM00038

(1) Horns

- Two horns (high and low tone) are installed behind the front bumper under the RH headlight.
- By positioning the horns at behind the front bumper and under the RH headlight, repair cost for damage due to light collision can be minimized.

POWER WINDOW

GLASS/WINDOWS/MIRRORS

1. Power Window

A: CONSTRUCTION

- The power window system consists of regulator motors and switches for individual doors, relays and a circuit breaker unit.
- Each door window can be opened/closed by pushing down/pulling up the switch.
- Only the driver's door window switch has a 2-stage mechanism:
 - When the switch is pushed down or pulled up lightly and held, the window continues to lower or raise until the switch is released.
 - When the switch is pushed down fully, the window opens to the end position automatically.

POWER WINDOW

GLASS/WINDOWS/MIRRORS

B: SCHEMATIC DRAWINGS

- | | |
|---------------------------------------|---|
| (1) Raise | (11) Ignition |

| (9) Driver's seat side | (19) Ground |
| (10) Door lock controller | |

DOOR MIRRORS

GLASS/WINDOWS/MIRRORS

2. Door Mirrors

A: GENERAL

- Door mirrors are powered and remote controllable, and on some models each mirror has a side turn signal light built in it.
- The mirror body is structured as a scalp cap. The portion that may be damaged easier (scalp cap part and the side turn signal lamp part) can be replaced, contributing to reduce repair cost.
- Water drops cannot easily adhere to the mirror surface or front door glass while driving in rain.
- Mirror heaters are used on some models.

- (1) Scalp cap
- (2) Groove
- (3) Side turn signal light

COMBINATION METER

INSTRUMENTATION/DRIVER INFO

1. Combination Meter

A: ELECTRO-LUMINESCENT METER

To increase desirability and visibility of the meter, an electro-luminescent meter is used on some models.

- Red LEDs are used for meter rings and needles illumination.
- The brightness of the meter display area can be properly adjusted to meet various conditions.
- An indicator that illuminates when the lighting switch is turned to the next position from OFF is provided.

(1) Meter ring

(2) Needle

COMBINATION METER

INSTRUMENTATION/DRIVER INFO

B: ILLUMINATION AND NEEDLES

1. INITIAL OPERATION

- Electro-luminescent meter

When the ignition switch is turned ON, the meter rings are illuminated first, and the needles are lit next. Then the needle moves from the minimum reading to the maximum reading, and then returns to the minimum reading. Finally the dial illumination and LCD turn on.

- Standard meter

When the ignition switch is turned ON, the meter needle moves from the minimum reading to the maximum reading and then returns to the minimum reading.

The illumination brightness can be adjusted by selecting any of the six steps of the instrument panel dial. (Adjustment is possible only when the lighting switch is ON for the standard meter.)

IDI00107

(1) Adjustment dial

(2) Brighter

(3) Darker

COMBINATION METER

INSTRUMENTATION/DRIVER INFO

C: WARNING AND INDICATOR LIGHTS

COMBINATION METER

INSTRUMENTATION/DRIVER INFO

- (1) Brake fluid level warning/parking brake indicator light
This light illuminates if the fluid level in the brake reservoir tank lowers below the specified level and/or when the parking brake is applied.
- (2) Seat belt warning light
This warning light illuminates when the ignition switch is turned ON, and goes out when the seat belt is fastened.
- (3) Door open warning light
This warning light illuminates when one or more doors and/or rear gate are not completely closed.
- (4) Low fuel warning light
This warning light comes ON when the quantity of the fuel remaining in the tank has decreased to 9 ℓ (2.4 US gal, 2.0 Imp gal) or less.
- (5) Engine malfunction indicator light
This light illuminates if a fault occurs in the MFI (Multiple point Fuel Injection) system.
- (6) Charge warning light
This warning light illuminates when a fault occurs in the charging system while the engine is running.
- (7) Oil pressure warning light
This light illuminates when the engine oil pressure decreases below 14.7 kPa (0.15 kgf/cm², 2.1 psi).
- (8) AIR BAG system warning light
This warning light illuminates if a fault occurs in the airbag system.
- (9) ABS warning light
This warning light illuminates if a fault occurs in any electrical component of the ABS (Anti-lock Brake System).
- (10) Vehicle dynamics control warning light and vehicle dynamics control OFF indicator light
This light illuminates when a fault occurs in any electrical component of the vehicle dynamics control. It also illuminates when the vehicle dynamics control OFF switch is pressed.
- (11) AWD warning light (AT)
This warning light illuminates if the vehicle is driven with front and rear tire sizes different from each other. On 4AT models, this indicator illuminates when the drive mode is changed from AWD to FWD (with the fuse installed in the FWD switch).
- (12) AT oil temperature warning light (AT)
This warning light illuminates when the ATF temperature exceeds 150°C (302°F).
- (13) Tire pressure warning light
This warning light illuminates when the air pressure in either of the tires drops below the specified value while traveling, and flashes when a fault occurs in the tire pressure monitoring system.
- (14) Sports mode indicator (AT)
This indicator illuminates when the AT selector lever is put in the sports mode position, and blinks if a fault occurs in the AT control system.

COMBINATION METER

INSTRUMENTATION/DRIVER INFO

When everything is normal, the warning and indicator lights should be ON or OFF as shown below according to ignition switch positions.

Warning/Indicator light		Ignition switch position			
		LOCK/ACC	ON	ST	While engine is running
(1)	Brake fluid level / parking brake	OFF	ON	ON	*1
(2)	Seat belt	OFF	*2	*2	*2
(3)	Door or rear gate open	• Open	ON	ON	ON
		• Closed	OFF	OFF	OFF
(4)	Low fuel level	OFF	*3	*3	*3
(5)	Engine malfunction indicator	OFF	ON	ON	OFF
(6)	Charge	OFF	ON	ON	OFF
(7)	Oil pressure	OFF	ON	ON	OFF
(8)	AIR BAG	OFF	*4	*4	*4
(9)	ABS	OFF	*5	*5	*5
(10)	Vehicle dynamics control	OFF	ON	ON	OFF
(11)	AWD	OFF	*6	*6	*6
(12)	AT oil temperature	OFF	ON	ON	OFF
(13)	Tire pressure	OFF	*5	*5	*5
(14)	Sports mode	OFF	OFF	OFF	*7

*1: This warning light illuminates when the parking brake is applied.

*2: This warning light flashes after the ignition switch is turned ON until the drivers seat belt is fastened.

*3: This warning light illuminates when the quantity of the fuel remaining in the tank has decreased to 9 ℓ (2.4 US gal, 2.0 Imp gal) or less.

*4: This warning light illuminates for about 6 seconds, and then goes out.

*5: This warning light illuminates for about 2 seconds, and then goes out.

*6: This warning light illuminates if the front and rear tire sizes are different from each other. This also illuminates when the drive mode is changed from AWD to FWD (4AT models).

*7: This light illuminates when the AT selector lever is moved to the sports mode position.

COMBINATION METER

INSTRUMENTATION/DRIVER INFO

MEMO

IDI-7

COMBINATION METER

INSTRUMENTATION/DRIVER INFO

D: TELLTALE LIGHT

COMBINATION METER

INSTRUMENTATION/DRIVER INFO

- (1) Turn signal indicator light
This light blinks in unison with the corresponding turn signal lights when the turn signal switch is operated.
- (2) Lighting switch indicator light
Turns on when the lighting switch is turned to the next position from OFF.
- (3) Headlight beam indicator
This light illuminates when the headlights are in the high-beam position.
- (4) Immobilizer indicator
This light illuminates when the immobilizer systems are armed.
- (5) Front fog light indicator light
This light illuminates when the front fog lights are ON.
- (6) CRUISE indicator light
This light illuminates when the cruise control main switch is turned ON.
- (7) SET indicator light
This light illuminates when the cruise control main switch is turned ON and the SET/COAST switch on the command switch is turned ON.
- (8) Vehicle dynamics control function indicator light
This light blinks when the vehicle dynamics control is operating.
- (9) AT selector lever position indicator (AT)
The indicator corresponding to the present AT select lever position illuminates when the ignition switch is in any position other than ACC and LOCK.
- (10) Sports shift indicator (AT)
Indicates the current gear position when sports shift is selected.

COMBINATION METER

INSTRUMENTATION/DRIVER INFO

When everything is normal, the telltales should be ON, OFF or in other states as shown below according to ignition switch position.

Telltale light		Ignition switch position			
		LOCK/ACC	ON	ST	While engine is running
(1)	Turn signal	OFF	Blink	Blink	Blink
(2)	Lighting switch	OFF	*1	*1	*1
(3)	Headlight beam	• High beam	OFF	ON	ON
		• Low beam	OFF	OFF	OFF
(4)	Immobilizer	*2	OFF	OFF	OFF
(5)	Front fog light	Front fog light ON	OFF	ON	ON
(6)	CRUISE	OFF	OFF	OFF	ON
(7)	SET	OFF	OFF	OFF	*3
(8)	Vehicle dynamics control	OFF	*4	ON	OFF
(9)	AT selector lever position	OFF	ON	ON	ON
(10)	Sports shift indicator	OFF	*5	OFF	*5

*1: Turns on when the lighting switch is turned to the next position from OFF.

*2: This light illuminates when the immobilizer system is armed.

*3: This light illuminates when the SET/COAST switch is turned ON while driving at 40 km/h (25 MPH) or higher.

*4: This light illuminates for about 2 seconds, and then goes out.

*5: Indicates the current gear position when sports shift is selected. It also illuminates for about 2 seconds when the ignition switch is turned ON.

COMBINATION METER

INSTRUMENTATION/DRIVER INFO

E: SPEEDOMETER

1. GENERAL

- The speedometer system is an electrical type that uses electric signals from the ABS or vehicle dynamics control (VDC) control module.
- Since the system does not use mechanical components such as rotating cable, there are no opportunities of occurring such problems as meter needle vibration and cable disconnection. Also, it does not constitute any means of mechanical noise transmission.
- The odometer and trip meter readings appear on a liquid crystal display (LCD).
- At the trip meter display, the illumination level and the following trouble information (abnormality of various control modules, communication system, vehicle speed signals, etc.) are shown in addition to the trip meter reading.

Indication	Indicated fault
“Er --”	High speed and low speed CAN communication failed simultaneously
“Er HC”	High speed CAN communication failure
“Er LC”	Low speed CAN communication failure
“Er IU”	Body integrated unit failure inside
“Er EG”	Engine control module communication counter failure
“Er tC”	Transmission control module communication counter failure
“Er Ab”	ABS/VDC control module communication counter failure
“Er SP”	Vehicle speed signal abnormal (ABS/VDC diagnostic trouble code information)
“Er SS”	Vehicle speed signal abnormal (wheel speed signal abnormal)

2. OPERATION

The ABS or VDC control module calculates the vehicle speed based on signals from the four wheel speed sensors and sends vehicle speed signals (4 pulses per rotation of wheel) to the speedometer drive circuit and odometer/trip meter drive circuit in the speedometer.

NOTE:

Signals from the ABS or VDC control module are also used by the engine control module, automatic transmission control module, etc.

3. SPECIFICATIONS

Speedometer	Type	Electric pulse type	
	Indication	km/h	The needle points to 60 km/h (37.3 MPH) when 2,548 pulses are input per minute.
		MPH	The needle points to 60 MPH (95 km/h) when 4,104 pulses are input per minute.
Odometer	Type	Pulse count type	
	Display	LCD/6 digits; 0 to 999,999 km (miles)	
	Indication	Counts up 1 km per 2,548 pulses. (4,104 pulses per mile)(Count down is impossible.)	
Trip meter	Type	Pulse count type	
	Display	LCD/4 digits; 0 to 999.9 km (miles) and 1000 to 9999 km (miles).	
	Indication	Counts up 1 km per 2,548 pulses. (4,104 pulses per mile)(To change the trip meter from A to B or B to A, push the knob momentarily. To return the trip meter to zero indication, keep the knob pushed for more than 1 second.)	

COMBINATION METER

INSTRUMENTATION/DRIVER INFO

F: TACHOMETER

The tachometer drive circuit is connected to the engine speed sensing circuit in the engine control module.

When the engine speed increases or decreases, the voltage of the circuit also increases or decreases, changing the magnetic force of the tachometer drive coil.

The tachometer needle then moves in accordance with change in the engine speed.

- (1) Ignition switch
- (2) Combination meter
- (3) Microprocessor

- (4) Tachometer
- (5) Engine control module

COMBINATION METER

INSTRUMENTATION/DRIVER INFO

G: WATER TEMPERATURE GAUGE

- Water temperature signals are generated at the engine coolant temperature sensor on the engine, and after converted into digital signals, these signals are sent via the body integrated unit to the combination meter.
- The resistance of the engine coolant temperature sensor changes according to the engine coolant temperature. Therefore, the signals sent to the water temperature gauge also changes according to the engine coolant temperature. As the change in signals causes the magnetic force of the step motor to change, the gauge needle moves according to the engine coolant temperature.
- When the coolant is at a normal operating temperature of approx. 85 to 100°C (158 to 212°F), the gauge needle stays in the middle of the indication range as shown below.

- | | |
|-----------------------|--|
| (1) Red zone | (6) Microprocessor |
| (2) Indication | (7) Water temperature gauge |
| (3) Temperature (°C) | (8) Body integrated unit |
| (4) Ignition switch | (9) Engine control module |
| (5) Combination meter | (10) Engine coolant temperature sensor |

COMBINATION METER

INSTRUMENTATION/DRIVER INFO

H: FUEL GAUGE

1. GENERAL

- The fuel gauge unit consists of a float and a potentiometer whose resistance varies depending on movement of the float. It is located inside the fuel tank and forms an integral part of the fuel pump. The fuel gauge indicates the fuel level in the tank when the ignition switch is in the ON position. When the trip knob is pushed, the fuel gauge illumination comes ON and the fuel level registered just before the ignition switch was turned OFF is indicated, even when the ignition switch is in the OFF position.

- All models are equipped with two fuel level sensors. These sensors are installed in the fuel tank, one on the right side and the other on the left side. Two sensors are necessary because the fuel tank is divided into main and sub tank compartments.

IDI00017

- (1) Main fuel level sensor
- (2) Fuel sub level sensor
- (3) Float

COMBINATION METER

INSTRUMENTATION/DRIVER INFO

2. OPERATION

The low fuel warning light operates as follows:

The signal from the fuel level sensor is converted into a digital signal at the body integrated unit, and then sent to the combination meter. The combination meter microprocessor continually monitors this signal. It turns on the low fuel warning light in the combination meter if a resistance value corresponding to the critical fuel level is detected for a certain time while driving.

This monitoring time has been decided to avoid false operation of the warning light, which may happen when a large part of remaining fuel is collected temporarily in the sub tank compartment.

- (1) Main fuel level sensor
- (2) Fuel sub level sensor
- (3) Fuel tank

3. SPECIFICATIONS

	Fuel level	Resistance
Main fuel level sensor	Full	1.0 — 3.0Ω
	Empty	30.9 — 32.9Ω
Fuel sub level sensor	Full	1.0 — 3.0Ω
	Empty	61.1 — 63.1Ω

COMBINATION METER

INSTRUMENTATION/DRIVER INFO

I: DIAGNOSIS MODE

1. GENERAL

The combination meter is provided with a self diagnosis function and a diagnostic trouble code display function which indicate DTCs for the engine, transmission and ABS/VDC control modules. To enter diagnosis mode, the diagnosis connector located near the fuse box under the right side of the driver's seat is used.

(1) Diagnosis connector

2. PROCEDURE

● Entering diagnosis mode

- 1) Connect the diagnosis connector.
- 2) Turn ON the ignition switch.
- 3) During initial operation of the meter and while the needle is moving, push the trip knob once to enter diagnostic trouble code display mode, or push the knob twice to enter self diagnosis mode.

NOTE:

If the vehicle is driven while in diagnosis mode (vehicle speed signals input), diagnosis mode is cancelled.

● To exit diagnosis mode

Turn OFF the ignition switch and disconnect the diagnosis connector to exit diagnosis mode.

COMBINATION METER

INSTRUMENTATION/DRIVER INFO

3. FUNCTION

- **Self diagnosis mode**

When self diagnosis mode is activated, the system switches to warning lights, indicators, needle movement, illumination or buzzer check mode (sports shift) each time the trip knob is pushed.

- **Diagnostic trouble codes display mode**

When diagnostic trouble code display mode is activated, the display switches to indicate engine control module, transmission control module, or ABS/VDC control module diagnostic trouble codes each time the trip knob is pushed. In addition to the type of control module, the display will show whether the diagnostic trouble codes are now being received, present, or not. If CAN communication is failed, "-----" is displayed.

Control module	Status	Indication
Engine control module	Receiving diagnostic trouble codes	Trip "A" + "P (blink)"
	Diagnostic trouble codes present	Trip "A" + "P xxxx"
	No failure exists	Trip "A" + "P ----"
Transmission control module	Receiving diagnostic trouble codes	Trip "B" + "P (blink)"
	Diagnostic trouble codes present	Trip "B" + "P xxxx"
	No failure exists	Trip "B" + "P ----"
ABS/VDC control module	Receiving diagnostic trouble codes	Trip "A" + "C (blink)"
	Diagnostic trouble codes present	Trip "A" + "C xxxx"
	No failure exists	Trip "A" + "C ----"
CAN communication error	—	"-----"

CLOCK UNIT

INSTRUMENTATION/DRIVER INFO

2. Clock Unit

A: GENERAL

The clock unit display can be switched to indicate outside air temperature, fuel efficiency, remaining travel distance or continuous driving time, by operating a button. The DISP button is used for switching the display, and the indicated information switches in the following sequence each time the button is pressed: outside temperature → fuel efficiency at the instant → average fuel efficiency → remaining travel distance → continuous driving time. These data are sent from the combination meter by means of digital communication. This clock unit is provided with a function to automatically display a failure; if the accessory power circuit is open it displays “Acc”, and if the ignition power circuit is open it displays “ign”. If an abnormality is detected in the communication between the combination meter and clock unit or in the received data, “Err” is displayed. If no data can be received, “Err” will always be displayed even when the indication is switched with the DISP button, but when only a specific data is not received, “Err” will be displayed only when the indication is switched to display that data. For example, if outside temperature data is not received “Err” will be displayed only when the thermometer feature is selected, and other indications such as the fuel efficiency meter will be displayed normally.

IDI00167

IDI00172

- (A) For U.S.
- (1) Clock unit
- (2) DISP button

- (B) For Canada
- (3) BRIGHT button

B: OPERATION

1. CLOCK DISPLAY

The clock shows time when the ignition switch is turned to ACC or further from OFF.

2. INSTANT FUEL EFFICIENCY, AVERAGE FUEL EFFICIENCY, REMAINING TRAVEL DISTANCE AND CONTINUOUS DRIVING TIME DISPLAY

The combination meter microprocessor performs calculations based on vehicle speed signals from the ABS/VDC control module, remaining fuel signals from the body integrated unit, fuel efficiency signals from the engine control module, and engine start signals, and then sends the data to the clock unit.

- **Average fuel efficiency**

The value is calculated from the distance and total amount of consumed fuel since the trip meter has been reset the last time.

- **Instant fuel efficiency**

The value is calculated during driving, based on the traveled distance and amount of consumed fuel recorded for a certain period.

- **Remaining travel distance**

The value is calculated from the average fuel efficiency in recent 30 km (18.8 miles) and the amount of remaining fuel.

- **Continuous driving time**

Indicates the total time since the engine has been started.

3. OUTSIDE AIR TEMPERATURE DISPLAY

The body integrated unit performs calculations based on outside air temperature signals from the ambient sensor and vehicle speed signals from the ABS/VDC control module, and then sends the data via the combination meter to the clock unit.

4. BRIGHT (DIMMER CANCELING) FUNCTION

The dimmer can be cancelled by pushing the BRIGHT button when the lighting switch is ON. The lights returns to the dimmed state when the button is pushed again.

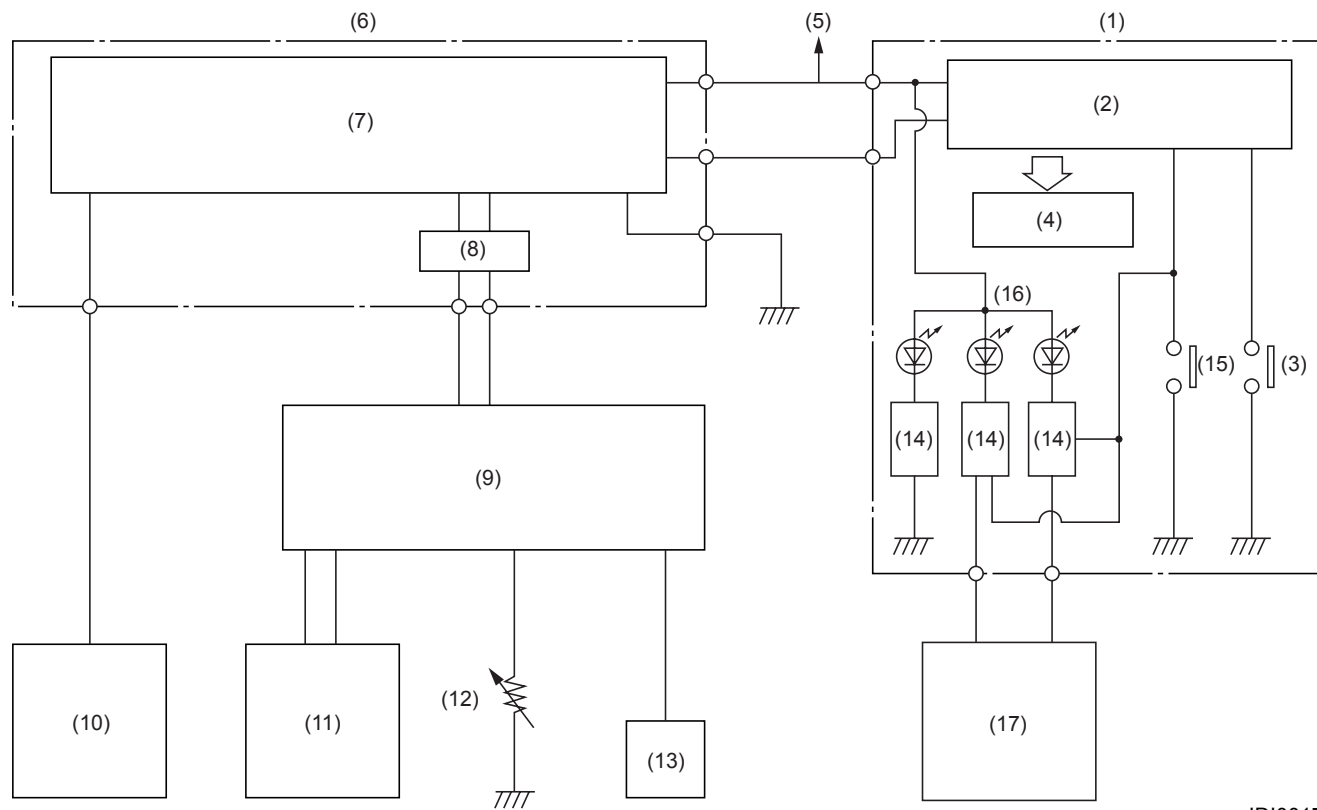

5. PASSENGER'S SEAT AIRBAG INDICATOR

When this indicator (a mark on vehicles for Canada) is ON, the passenger's seat airbag will deploy in case of a front collision that should cause the airbag system to activate. When the indicator (a mark on vehicles for Canada) is OFF the passengers seat airbag will not deploy.

FRONT SEAT

SEAT

1. Front Seat

A: ADJUSTMENT

Adjustment ranges are expanded to fit a wider variety of body types.

- The height of each headrest is adjustable to any of the 3 positions available.
- The uppermost position of the backrest is 11° rearwards from the perpendicular; the reclining angle is widened.
- A “towel bar” type seat slide lever is used for easier operation.
- The seat lifter mechanism has been changed from a system that lifts only the cushion to a system that lifts the entire seat.

SE-00419

SE-00420

FRONT SEAT

SEAT

B: HEIGHT ADJUSTER

The driver's seat is provided with a height adjuster. Both the seat cushion and backrest rise every time the lifter lever is pulled up; they lower every time the lever is pushed down.

The lever is enlarged for easier operation.

SE-00374

(1) Lifter lever

(2) Seat height adjustment range

C: ACTIVE HEADREST

In case of rear-end collision, the headrest moves forward to immediately support the passenger's head to reduce the possibility of injury to the neck.

SE-00036

FRONT SEAT

SEAT

SE-00037

- 1) In case of rear-end collision, the passenger's body will move rearward by the impact.
- 2) When the body moves rearward, the thrust receiving plate inside the seat is pressed in.
- 3) When the thrust receiving plate is pressed in, the headrest moves forward due to a levering action.

2. Rear Seat

A: OPERATION

1. SEDAN MODELS

The backrest has an armrest. It is also featured with a “center through” function.

SE-00396

2. WAGON MODELS

- Unlock the backrest by pushing the release button and then fold the backrest forwards.
- The backrest and shoulder portions are separated to improve support of the rear passenger's body. The backrest is also provided with a single-action folding feature, which contributes to form a flat luggage room by folding only the backrest forwards.

SE-00377

OCCUPANT DETECTION SYSTEM

SEAT

3. Occupant Detection System

A: GENERAL

The passenger's seat is equipped with an occupant detection system, which consists of an occupant detection control module and four loadcell sensors, etc.

The occupant detection system sends signals to control the deployment of the passenger's seat airbag when a child or small person is sitting in the passenger's seat.

B: SYSTEM CONFIGURATION

The components of the occupant detection system are integrated as a seat cushion frame assembly; the assembly cannot be disassembled and the components cannot be replaced separately.

1. OCCUPANT DETECTION CONTROL MODULE

SE-00475

The occupant detection control module is installed under the passenger's seat and detects the presence/absence and physique of the person sitting in the passenger's seat based on signals sent from the loadcell sensors to send signals to the airbag control module.

If there is any abnormality in the occupant detection control module, the airbag warning light in the combination meter illuminates to warn the driver of system abnormality. Diagnostic trouble codes can be read by using a Subaru select monitor.

OCCUPANT DETECTION SYSTEM

SEAT

2. LOADCELL SENSOR

SE-00476

Four loadcell sensors are installed on the passenger's seat and each sensor measures the load to send signals to the load occupant detection control module.

OCCUPANT DETECTION SYSTEM

SEAT

3. PASSENGER'S SEAT AIRBAG INDICATOR

SE-00477

The passenger's seat airbag indicator light is built in the center part of the instrument panel. The light indicates the result judged by the occupant detection control module.

Depending on the occupant detection control module's decision, the passenger's seat airbag may not deploy even in case of a frontal collision, however, the driver's seat airbag will deploy and the driver/passenger seat belt pretensioners are controlled to activate. Also, the driver/passenger seat side airbags and the left/right curtain airbags are controlled to activate.

For initial check of the occupant detection system, both the ON (will deploy) and OFF (will not deploy) indicators will illuminate for about 6 seconds after the ignition switch is turned ON, and then turns OFF simultaneously for 2 seconds.

SUNROOF

SUNROOF/T-TOP/CONVERTIBLE TOP

1. Sunroof

A: SEDAN MODELS

1. DESCRIPTION

The sunroof operates on an automatic opening/closing system including tilt and slide mechanisms.

- A motor with a built-in microprocessor is used for the sunroof motor, which provides one-touch automatic opening and closing functions with a jamming prevention feature. (The system operates in auto mode when the switch is pushed for more than 0.3 seconds.)
- Reduced thickness of the sunroof provides extra overhead clearance in the passenger compartment.
- The frame, glass lid and mechanism parts are refined to reduce considerable amount of weight.

2. FUNCTION

● Sunroof tilting and sliding operation

- With the glass lid fully closed, pushing the rear side of the tilt switch causes the rear end of the glass lid to rise by 30 mm (1.18 in). Pushing then the front side of the switch causes the lid to lower to the original position.

- Pushing the OPEN/CLOSE switch rearward causes the glass lid to slide rearward and open. Pushing the switch forward causes the glass lid to move forward and stop at a point 150 mm (5.91 in) before the fully closed position. Pushing the switch again closes the lid completely.

● Sunshade operation

- The sunshade can be opened or closed manually when the glass lid is closed.
- The sunshade moves rearward together with the glass lid when the OPEN side of the OPEN/CLOSE switch is pushed. (When closed, only the glass lid moves.)

SUNROOF

SUNROOF/T-TOP/CONVERTIBLE TOP

B: WAGON MODELS

1. DESCRIPTION

The sunroof operates on an automatic opening/closing system, and the joined opening area consists of a tilting front glass lid and a sliding rear glass lid.

SR-00105

- (1) Front glass lid
- (2) Rear glass lid
- (3) Motor
- (4) Frame
- (5) Sunshade

- The sunroof openings are joined to form a single, wide opening (720 mm (28.35 in) long and 600 mm (23.62 in) wide), aiming to improve the “open and free” feeling to a great extent.
- A motor with a built-in microprocessor is used for the sunroof motor, which provides one-touch automatic opening and closing functions with a jamming prevention feature. (The system operates in auto mode when the switch is pushed.)
- The frame, glass lid and mechanism parts are refined to reduce considerable amount of weight.
- The contour and tilt-up angle of the front glass lid are refined to enhance the effect as a deflector and reduce the wind blowing into the cabin when the sunroof is open. Also, the edge shape of the front glass lid is optimized to minimize unpleasant wind shearing noise.

SUNROOF

SUNROOF/T-TOP/CONVERTIBLE TOP

2. FUNCTION

● **Open and close operations**

- When the switch is pushed rearwards, the rear edge of the front glass lid tilts up by 45 mm (1.77 in).
- When the switch is pushed forwards, the front glass lid tilts down to the fully closed position and then stops.
- When the sunroof switch is pushed rearwards while the front glass lid is fully closed, the rear end of the front glass lid stops at a position ready for tilting up. When the switch is pushed again, the rear end of the front glass lid further tilts up to a position of 70 mm (2.76 in), and the rear glass lid slides and opens to a position 410 mm (16.14 in) from the rear end of the front glass lid and stops. When the sunroof switch is pushed again, the rear glass lid opens to the wide-open position [550 mm (21.65 in) from the front glass lid rear end].
- When the sunroof switch is pushed forwards while the rear glass lid is at its wide-open position, the rear glass lid moves forward, and then comes to a stop when its front end reaches a position 150 mm (5.91 in) from the rear end of the front glass lid. When the sunroof switch is pushed again, the rear glass lid moves to the fully closed position, and the front glass lid closes until it reaches its tilted up position. When the sunroof switch is pushed once more, the front glass lid tilts down to the fully closed position.

● **Sunshade operation**

- When the front glass lid tilts up, the shade opens at its front edge by 20 mm (0.79 in) in connection with the lid, to improve ventilation. However, when tilting down the shade will not move in connection with the front glass lid so the shade must be manually closed.
- The sunshade automatically opens or closes together with the rear glass lid. However, when completely closing the sunroof, the sunshade will come to a stop at a position 170 mm (6.69 in) before the fully closed position even when the front glass lid is completely tilted down. Close the shade manually after the glass lid is completely closed.

UNDER COVER

EXTERIOR/INTERIOR TRIM

1. Under Cover

A: FLOOR UNDER COVER

- A floor under cover is installed to both sides of the vehicle's floor part to improve the aerodynamic characteristics at the underside of the vehicle.
- Taking recycling reasons into account, polypropylene (PP) material is used.

EI-00824

B: FUEL TANK PROTECTOR

- A fuel tank protector is installed to prevent damage to the fuel tank by flying stones etc. during driving.
- Taking recycling reasons into account, polypropylene (PP) material is used.

EI-00825

2. Front Bumper Beam

A bumper beam assembly is placed inside the front bumper. The beam assembly is fastened to the chassis frame and absorbs the shock energy in case of a front collision to enhance safety of the vehicle.

- (1) Energy absorber foam
- (2) Bumper beam reinforcement
- (3) Bumper beam bracket

EI-01034

REAR BUMPER BEAM

EXTERIOR/INTERIOR TRIM

3. Rear Bumper Beam

- A bumper beam assembly is placed inside the rear bumper. The beam assembly is fastened to the chassis frame and absorbs the shock energy in case of a rear collision, etc. to reduce damage to the vehicle.
- The rear bumper assembly consists of a bumper face bracket, main beam, main beam bracket, and energy absorber foam made of PP foam.

EI-01035

- | | |
|-----------------------|--------------------------|
| (1) Main beam | (4) Energy absorber foam |
| (2) Main beam bracket | (5) Lower bracket |
| (3) Beam upper rear | (6) Corner bracket |

ROOF SPOILER (WAGON MODELS)

EXTERIOR/INTERIOR TRIM

4. Roof Spoiler (Wagon Models)

- The spoiler is built into the rear gate and is provided as standard equipment.

- In connection with providing the spoiler on all models, the high mount stop light and rear washer nozzle are incorporated in the roof spoiler.

EI-00821

(1) High mount stop light

(2) Rear washer nozzle

INSTRUMENT PANEL

EXTERIOR/INTERIOR TRIM

5. Instrument Panel

- By modularizing the panel with the steering support beam, a sufficient rigidity is obtained, its quality is stabilized, and maintainability is improved.
- By tilting the center panel toward the driver, its operability and visibility is improved.
- There is no longer a split line between the passenger's airbag module lid and the instrument panel, contributing to a better appearance.
- Taking recycling reasons into account, PP resin is used for the main body. The entire upper part of the instrument panel is covered with urethane foam material with a soft surface skin. This material feels soft while it also contributes to protect passengers.
- An insulator is installed to the backside of the instrument panel. The insulator absorbs noise from the engine room and contributes to improve the quietness in the cabin.
- The panel is upholstered as far as the leg area of front passenger to improve the feel of material.

EI-01036

- | | |
|---|--|
| (1) Center pocket | (6) Cup holder for front seat passengers |
| (2) Clock | (7) Ashtray and cigarette lighter |
| (3) Fuse box cover | (8) Center panel |
| (4) Console box | (9) Glove box |
| (5) Cup holder for rear seat passengers | |

INSTRUMENT PANEL

EXTERIOR/INTERIOR TRIM

A: CENTER POCKET

- A pocket with a lid is provided at the center of the instrument panel.
- Night illumination, which operates in connection with the lighting system, is provided.

B: ASHTRAY AND CIGARETTE LIGHTER FOR FRONT SEAT PASSENGERS

- These are located at the lower part of the center panel and can be opened in one-push action.
- The ashtray and cigarette lighter are provided with night illumination, which operates in connection with the lighting system.

INSTRUMENT PANEL

EXTERIOR/INTERIOR TRIM

C: GLOVE BOX

- The glove box is provided with a damper that controls the glove box lid to open slowly.
- It is also provided with night illumination that operates in connection with the lighting system.

EI-01068

D: CUP HOLDER FOR FRONT SEAT PASSENGERS

- Provided with a shutter type lid that can be closed when the cup holder is not used.
- The cup holder can hold a container up to a 500 cc size plastic bottle or an L size paper cup.

EI-00688

E: CONSOLE BOX

- An accessory socket is provided in the console box.

- When using the socket, the cable can be routed out from the front of the console box so that the cable will not be trapped even when the console lid is closed.

DOOR TRIM

EXTERIOR/INTERIOR TRIM

6. Door Trim

Shock absorbing pads installed to the backside of the front and rear door trims attenuate the impact due to a secondary collision.

EI-00826

TRUNK ROOM TRIM

EXTERIOR/INTERIOR TRIM

7. Trunk Room Trim

Trunk lid trims and trunk lid arm covers are used to improve the feel of material.

EI-00823

FRONT HOOD

EXTERIOR BODY PANELS

1. Front Hood

An aluminum hood is used on all models to reduce weight.

REAR GATE PANEL

EXTERIOR BODY PANELS

2. Rear Gate Panel

An aluminum rear gate panel is used on all models.

By changing the material to aluminum, the weight is reduced and the opening and closing of the rear gate is facilitated.

EB-00166

TRUNK LID

EXTERIOR BODY PANELS

3. Trunk Lid

A: TRUNK LID ARM

By minimizing the size of the trunk lid arm, the traveling radius of the arm is made smaller to acquire a wider cargo space.

EB-00167

(1) New type

(2) Former type

The trunk lid arm is stored inside the trunk trim when the trunk lid is closed. This prevents the luggage from interfering with the arm when closing the trunk.

EB-00168

FRONT FENDER PANEL

EXTERIOR BODY PANELS

4. Front Fender Panel

By providing a clearance (A) between the wheel apron upper area and the fender upper area, the impact absorbing capacity and pedestrian protection is enhanced.

(1) Fender extension, front

(2) Fender extension, rear

EB-00172

DOOR

EXTERIOR BODY PANELS

5. Door

A: DOOR CONSTRUCTION

- The front and rear doors have in their inside a side door beam and a window shoulder area reinforcement.

(1) Side door beam

(2) Window shoulder area reinforcement

DOOR

EXTERIOR BODY PANELS

- Tight closure of each door is ensured by the double weather strip at the bottom which also reduces intruding noise.

EB-00170

- | | |
|-------------------------|-----------------------|
| (1) Outer weather strip | (4) Scuff plate |
| (2) Inner weather strip | (5) Side sill spoiler |
| (3) Door panel | |

B: REAR DOOR CATCHER

This prevents the rear door from deflecting into the cabin in case of a side collision.

EB-00171

FRONT

LIGHTING SYSTEM

1. Front

A: GENERAL

(1) Headlight

(2) Front turn signal/parking, front side marker light

(3) Front fog light

(4) Side turn signal light

- The headlight of all models consists of four halogen bulbs, and projector type low beam lights are used.
- The front turn signal/hazard warning light, parking/front side marker light and the front side reflex reflector are incorporated into the headlight.
- The fog light is either of a projector type or a large sized multiple reflector type.
- On some models, the side turn signal lights are built into the lower part of the door mirrors to improve visibility. Also, LEDs (light emitting diodes) are used for light source to improve the durability.

REAR

LIGHTING SYSTEM

2. Rear

A: GENERAL

Sedan models

- | | |
|--------------------------------------|--------------------------------------|
| (1) High mount stop light | (4) Stop/tail/rear side marker light |
| (2) Turn signal/hazard warning light | (5) License plate light |
| (3) Backup light | |

Wagon models

- | | |
|----------------------------|--------------------------------------|
| (1) High mount stop light | (4) Turn signal/hazard warning light |
| (2) Rear side marker light | (5) Backup light |
| (3) Stop/tail light | (6) License plate light |

REAR

LIGHTING SYSTEM

- On sedan models, the rear turn signal/hazard warning light, stop/tail/rear side marker light, and the backup light are incorporated into the rear combination light. On wagon models, the rear turn signal/hazard warning light, stop/tail light, and the rear side marker light are incorporated into the rear combination light. On both the sedans and wagons, the rear reflex reflector and the rear side reflex reflector are incorporated into the rear combination light. On wagons, the backup lights are built in the rear gate garnish.
- The high mount stop light is installed to the bottom inside of the rear window on sedans, and to the rear of the roof spoiler on wagons.
- By using LEDs (light emitting diodes) as light source for the high mount stop light on wagon models, space is saved, efficiency is improved, and power consumption is reduced while the durability is improved.

AUDIO SYSTEM

ENTERTAINMENT SYSTEM

1. Audio System

A: GENERAL

1. AUDIO

Three types are provided.

- Audio sets of all grades are shaped in a non-standard form to make them fit the contour of the instrument panel.
- All grades are CD-R/RW compatible*.
- The highest grade audio system is also compatible with CD-R/CD-RWs* containing MP3 files.
- The audio unit for automatic air conditioning equipped models has a built-in CD changer. Up to six CDs can be loaded.

*: Some CD-R/RW discs with particular characteristics, scratches or dirty spots may not be usable.

2. SPEAKERS

- On models with six speakers, a full-range speaker is installed to each door and a tweeter is installed to each front door.
- On models with seven speakers, a full-range speaker is installed to each door and a tweeter and sub woofer are installed to each front door. The sub woofer is mounted on the rear right quarter trim (wagons).

Models with the 6 speaker system

- (1) Audio unit
- (2) Front speaker

- (3) Tweeter
- (4) Rear speaker

AUDIO SYSTEM

ENTERTAINMENT SYSTEM

Models with the seven speaker system

ET-00152

- | | |
|-------------------|---------------------|
| (1) Audio unit | (4) Rear speaker |
| (2) Front speaker | (5) Woofer (wagons) |
| (3) Tweeter | |

3. ANTENNA

- An on-glass antenna system is equipped on all models.
- The antenna amplifier is installed at the upper part of the rear left pillar on sedan models or at the upper center part of the rear gate on wagon models.

SATELLITE SWITCHES

ENTERTAINMENT SYSTEM

2. Satellite Switches

A: GENERAL

The driver can operate the audio system without releasing the hand from the steering wheel. Illumination is provided for nighttime visibility.

(1) Mode switch

(2) ^ v (Up/down) switch

(3) + - (volume) switch

(4) Mute switch

SATELLITE SWITCHES

ENTERTAINMENT SYSTEM

1. MODE SWITCH

The mode of the audio system can be changed.

2. \wedge \vee (UP/DOWN) SWITCH

- When receiving radio or TV waves, the frequency can be changed upwards or downwards. When the receiver is tuned to a radio or TV station during the upward or downward seek, the seek stops. (seek up/seek down)
- While listening to a CD, the next track or previous track can be selected. (track up/track down)

3. + – (VOLUME) SWITCH

The sound level can be turned up or down.

4. MUTE SWITCH

The sound can be temporarily muted. When this switch is operated, "MUTE" is indicated on the audio display. The sound level is resumed when the switch is pushed again.

IGNITION KEY

SECURITY AND LOCKS

1. Ignition Key

A: GENERAL

- A keyless entry system with a keyfob type transmitter is introduced. On models with immobilizer system, a transponder is assembled in the key.

SL-00388

(1) Transponder built-in

SL-00389

(1) Lock button
(2) Unlock button

(3) Trunk or rear gate button
(4) Panic button

2. Ignition Switch

A: GENERAL

1. IGNITION SWITCH

- The ignition switches on the MT models have a safety mechanism that prevents inadvertent locking of the steering wheel during driving. The driver cannot turn the ignition key from “ACC” to “LOCK” unless the key is pushed inward at the “ACC” position (arrow 1 in the drawing below).

SL-00031

- The ignition key for AT models can be turned to the LOCK position only when the select lever is in the P position.

SL-00032

- (1) Ignition switch
- (2) Key interlock solenoid (AT)
- (3) Ignition key cylinder

2. KEY REMINDER CHIME

The reminder chime sounds when the driver’s door opens and the ignition key is in the “LOCK” or “ACC” position. The chime stops when the key is turned to the IGN position or removed from the ignition switch.

3. IGNITION SWITCH ILLUMINATION

The ignition switch illumination is lit for 3 seconds and then gradually darkens and turns off after the driver’s door is closed. If the ignition switch is turned to the ON position while the ignition switch illumination is ON, the ignition switch illumination turns OFF immediately. The body integrated unit controls the delayed off function.

POWER DOOR LOCK

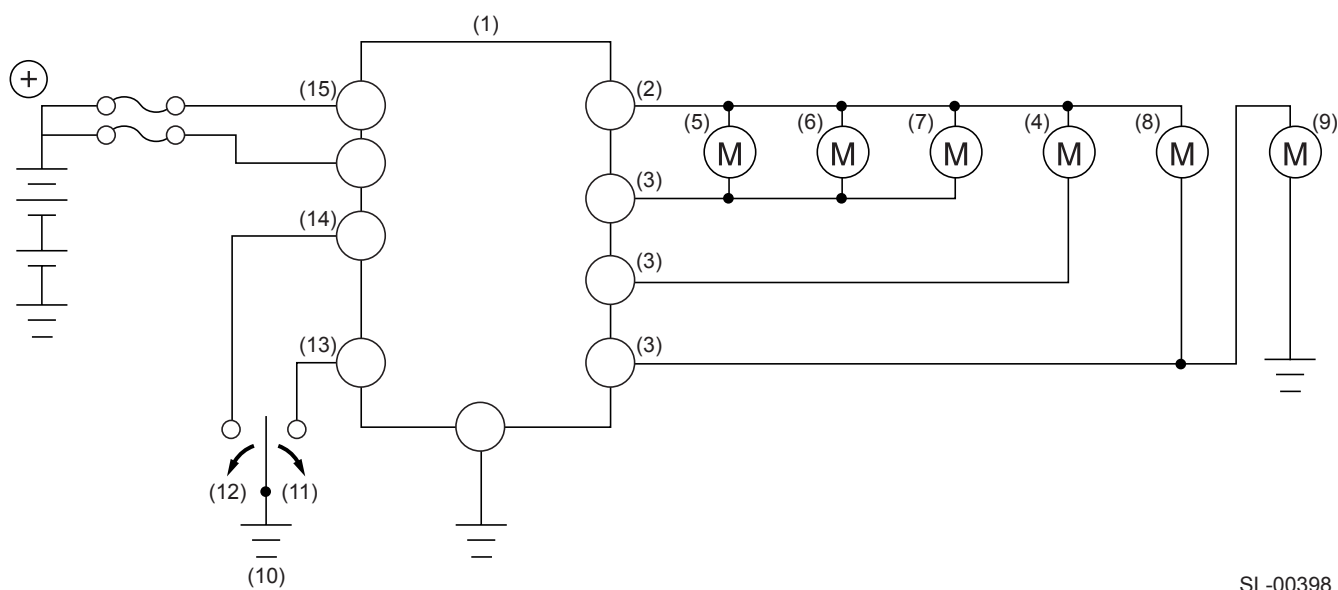

SECURITY AND LOCKS

3. Power Door Lock

A: CONSTRUCTION

- The power door lock system consists of a body integrated unit, drivers door lock switch, front door lock actuators, rear door lock actuators, and a rear gate lock actuator.
- When the driver's/front passenger's door is locked or unlocked using the door lock switch, the other doors and the rear gate are also locked or unlocked automatically.

B: SCHEMATIC DRAWINGS

- | | |
|--------------------------------------|------------------------------------|
| (1) Body integrated unit | (9) Trunk opener actuator (sedans) |
| (2) Lock output | (10) Door lock switch |
| (3) Unlock output | (11) Unlock |
| (4) Front LH actuator | (12) Lock |
| (5) Front RH actuator | (13) Unlock switch |
| (6) Rear LH actuator | (14) Lock switch |
| (7) Rear RH actuator | (15) Battery |
| (8) Rear gate lock actuator (wagons) | |

4. Keyless Entry System

A: CONSTRUCTION

- The keyless entry system consists of a transmitter, keyless entry control unit (with a built-in antenna), body integrated unit, door lock actuators, door switches, hazard warning lights, buzzer, and the interior light.
- The keyless entry system operates on a radio frequency, so the transmitter can be used in almost all directions relative to the vehicle. However, in some radio wave conditions the system may not operate properly.

NOTE:

The customizing function enables selection of coupled operation with the hazard warning lights. <Ref. to SL-12, Customizing Function.>

B: FUNCTION

1. DOOR LOCKING

- 1) Push the LOCK button on the transmitter once.
- 2) All doors are locked.
- 3) Check that the buzzer sounds once and the hazard warning lights flash once.

2. DOOR UNLOCKING (DRIVER'S DOOR)

- 1) Push the transmitter's UNLOCK button once.
- 2) The driver's door is unlocked and the interior light turns ON (when the interior light switch is set at the DOOR position).

NOTE:

The interior light illuminates for 15 seconds and then fades out. (However, if a door locking procedure is performed again during this period, the lights will go out immediately.) The extinguishing time can be changed with the customizing function.

- 3) Check that the buzzer sounds twice and the hazard warning lights flash twice.

3. DOOR UNLOCKING (ALL DOORS)

- 1) Push the UNLOCK button on the transmitter 2 times within 5 seconds.
- 2) All doors are unlocked.
- 3) Check that the buzzer sounds twice and the hazard warning lights flash twice.

NOTE:

- When the unlock button is pushed while any of the doors (except rear gate or trunk) is open, all door locks are unlocked.
- When pushing the UNLOCK button on the transmitter twice to unlock all doors, the system may not respond if the interval between the 1st time and 2nd time is too short.

KEYLESS ENTRY SYSTEM

SECURITY AND LOCKS

4. OPENING THE TRUNK

- 1) Push the TRUNK button on the transmitter for more than 1 second.
- 2) The trunk lid opens.
- 3) Check that the buzzer sounds twice and the hazard warning lights flash twice.

5. UNLOCKING THE REAR GATE LOCK

- 1) Push the TRUNK button on the transmitter once.
- 2) The rear gate lock is unlocked.
- 3) Check that the buzzer sounds twice and the hazard warning lights flash twice.

6. SELF POSITION DETECTION FUNCTION

- 1) Push the LOCK button on the transmitter 3 times within 5 seconds.
- 2) Check that the horn sounds once and the hazard warning lights flash 3 times.

7. PANIC ALARM

- 1) Push the panic button on the transmitter.
- 2) The horn sounds intermittently and the hazard warning lights will flash too. The panic alarm sounds for 30 seconds, however, to stop the alarm within this 30 seconds period, push any button on the transmitter.

8. ANSWER BACK (BUZZER SIGNALING) ON/OFF SELECTION

- 1) Push the UNLOCK button on the transmitter.
- 2) Push the LOCK and UNLOCK buttons on the transmitter simultaneously for more than 2 seconds to deactivate the answer back function. The function is armed again when the same operation is repeated.
- 3) When the answer back function is activated, the buzzer will sound once and the hazard warning lights flash once. When it is deactivated, the buzzer will sound twice and the hazard warning lights flash twice.

9. DOOR OPEN WARNING FUNCTION

The buzzer sounds five times and the hazard warning lights flash five times if the LOCK button on the transmitter is pressed with any door, the rear gate, or the trunk lid open.

10. TRANSMITTER REGISTRATION

- Up to 4 transmitters per vehicle can be registered.
- For the transmitter registration method, see Service Manual.

ALARM SYSTEM (BURGLAR ALARM SYSTEM)

SECURITY AND LOCKS

5. Alarm System (Burglar Alarm System)

A: FEATURES

- The alarm system protects the vehicle from a theft action (unauthorized entry into the vehicle). Upon detection of such an action, it gives alarm by causing the horn to sound and the hazard warning lights to flash.
- Unauthorized entry is monitored through the switches on the doors, rear gate, and trunk lid. If any of the switches is turned ON, the system interprets it as an attempt of unauthorized entry and gives alarm warning.
- Unauthorized entry is also monitored by the impact sensor (dealer option). The system operates in the same manner as mentioned above whenever the sensor senses an abnormal impact on the vehicle.

1. WARNING

- When activated, the alarm system causes the hazard warning lights to flash and the horn to sound intermittently. In addition to this, the security indicator light in the combination meter lights up.
- The alarms automatically turn OFF after 30 seconds. However, they will be reactivated if the vehicle is tampered with again.
- The alarms are activated when a door, rear gate or trunk lid is opened without unlocking with the keyless entry transmitter. (When the system is set, a warning is given even if a door is opened by operating the inner door handle.)
- The alarms are also activated when an impact on vehicle body is sensed. (Only vehicles with an impact sensor, which is available as dealer option.)
- On vehicles with an impact sensor, the alarms are activated even if electrical wirings for these equipment are cut.

NOTE:

- For information regarding the impact sensor, refer to their installation and operating instructions.

ALARM SYSTEM (BURGLAR ALARM SYSTEM)

SECURITY AND LOCKS

2. HOW TO SET THE SYSTEM

- 1) Remove the key from the ignition switch.
- 2) Close all the windows. Close and all doors, rear gate, and the trunk lid.
- 3) Push the LOCK button on the transmitter.
- 4) The keyless buzzer will sound once and the hazard warning lights flash once.

NOTE:

The system can be set even if the windows are open.

- 5) Check that the security indicator light flashes. If any of the doors or the rear gate is not closed properly, lock operation will not be accomplished when the LOCK button on the transmitter is pushed and therefore the keyless buzzer will not sound nor the hazard warning lights will not flash. When setting the alarm system, activation of the keyless entry system must be confirmed by the sound of keyless buzzer and flashing of the hazard warning lights. When the door, rear gate or trunk lid is closed, they will be automatically locked and the alarm system starts working. The indicator light blinks when the system is set and starts monitoring, and continues to blink until the system is disarmed. When the security indicator lamp is blinking as (B), the system is not ready yet and the alarm will not activate when a door is opened.

(A) Monitoring delay set to 0 seconds

(1) ON

(B) Monitoring delay set to 30 seconds (After 30 seconds has elapsed the system enters blinking status (A).)

(2) OFF

(3) 2 seconds

(4) 1 seconds

ALARM SYSTEM (BURGLAR ALARM SYSTEM)

SECURITY AND LOCKS

3. HOW TO UNSET THE SYSTEM

- 1) Push the UNLOCK button on the transmitter.
 - 2) The keyless buzzer will sound twice and the hazard warning lights flash twice.
 - 3) The security indicator light turns OFF.
 - 4) The interior light illuminates for maximum 30 seconds and then fades out. (However, if a system is set during this period, the interior light will turn OFF.)
- Insert the key into the door key cylinder and turn the key in the unlocking direction.

4. HOW TO STOP ALARMS

- Push a button on the transmitter. (Either of the LOCK, UNLOCK, or TRUNK buttons will work)
- Insert the key into the ignition switch and turn the key to the ON position. However, the alarm will not cease unless a registered key is used. (models with immobilizer)
- Insert the key into the ignition switch and repeat switching OFF to ON for three times. (models without immobilizer)
- Insert the key into the door key cylinder and turn the key in the unlocking direction.

IMMOBILIZER SYSTEM

SECURITY AND LOCKS

6. Immobilizer System

A: CONSTRUCTION

The immobilizer system consists of the following components: combination meter, body integrated unit, engine control module (ECM), transponder inside the ignition key, and an antenna fitted to the key cylinder.

The antenna receives a vehicle ID code emitted from the transponder when the key is inserted into the key cylinder.

The ID code is transmitted to the body integrated unit. The body integrated unit compares the code with a one that has been registered in it. The body integrated unit also compares the ID code with the ECM and the combination meter. If these ID codes match with each other, the system allows the engine to be started. The engine may be able to start when the key is inserted even if the codes do not match. The engine, however, will automatically stop after a few seconds.

The immobilizer function is activated automatically when the key is removed from the key cylinder and when 60 seconds have passed after the ignition switch was turned to the "ACC" or "OFF" position. When the function is activated, the indicator light on the combination meter flashes at intervals of 0.2 seconds ON and 2.8 seconds OFF. (When security system is not set)

This indicator light flashing indicates to the thief that the system is ready to function.

If the immobilizer system fails, an incorrect key is used or an incorrect ECM is installed, the immobilizer indicator light will illuminate when the key is inserted into the key cylinder or when the ignition switch is turned ON.

NOTE:

To heighten the anti-theft performance of the immobilizer system, the system is designed in a way that the immobilizer cannot be deactivated by simply reconnecting the wiring or by replacing parts. Therefore, care must be taken when replacing or repairing the related components.

SL-00053

- | | |
|------------------------|--|
| (1) Key | (5) Transponder |
| (2) Ignition switch ON | (6) Body integrated unit |
| (3) Key cylinder | (7) Engine control module |
| (4) Antenna | (8) Combination meter
(immobilizer indicator light) |

B: REGISTRATION

Registration is a procedure that must be carried out when an additional key is purchased or when either a key, ECM or combination meter is replaced. The procedure includes initialization of the system and re-registration of the ID code. Once initialized, the system loses the ID code it has retained so far and has no code until a new code is registered. ID codes for up to four keys (transponders) can be registered with a body integrated unit.

To prevent a copied key to be used, any set of keys (four maximum) can be registered only with one body integrated unit. Therefore, if a body integrated unit is replaced with a new one, the keys having been used with the old body integrated unit cannot be used with the new body integrated unit. The keys must be replaced simultaneously with the body integrated unit.

Registration is carried out by an authorized person using a select monitor and a special program. Access to the program is strictly controlled for reasons of security. The security ID (kept by customer) is required for registration. As the ID code for all registered keys are cleared when registration is started, registration must be performed with all keys including spares handed from the customer.

CUSTOMIZING FUNCTION

SECURITY AND LOCKS

7. Customizing Function

A: GENERAL

- The following system can be customized by using a SUBARU select monitor.

System name		Initial setting	Customized settings
Room light (delayed extinguish- ment)	Illuminating time after door closed	5 seconds	0 seconds (OFF)
			3 seconds (short)
			8 seconds (long)
	Illuminating time after keyless unlock operation	20 seconds	0 seconds (OFF)
			10 seconds (short)
			30 seconds (long)
Keyless entry system	Answer back buzzer	Existence setting	Yes
		ON/OFF	ON
	Hazard answer back	ON	OFF
Alarm system	Warning	ON/OFF	ON
		Monitoring delay setting	30 seconds
	Impact sensor	Existence setting	No
		ON/OFF	OFF
	Passive arming switching	OFF	ON
Rear defogger timer		OFF after 15 minutes	Operates for 15 minutes or continuously
Wiper deicer		OFF after 15 minutes	Operates for 15 minutes or continuously
Lockout prevention		ON	OFF
Battery drain prevention		ON	OFF

*:Setting is possible only with SUBARU select monitor.

NOTE:

Items above must be set to coincide with the vehicle's equipment and specifications for normal operation and diagnosis.

CRUISE CONTROL

CRUISE CONTROL SYSTEM

1. Cruise Control

A: OPERATION

- The cruise control system automatically controls the vehicle speed. It allows the vehicle to run at a constant speed without need for the driver to keep the accelerator pedal depressed.
- The cruise control system is controlled by the engine control module (ECM).
- When the driver has activated the system and made a desired speed setting, the engine control module (ECM) compares the actual vehicle speed detected by the speed sensor with the preset speed in the engine control module (ECM) memory, and then generates a signal according to the difference between the two speeds.

This signal is transmitted to the electronic control throttle.

The electronic control throttle operates the throttle valve as necessary to keep the preset vehicle speed.

CRUISE CONTROL

CRUISE CONTROL SYSTEM

B: LOCATION OF COMPONENTS

CC-00263

- (1) Engine control module (ECM)
- (2) Cruise control command switch (with built-in MAIN switch)
- (3) Stop light and brake switch
- (4) Cruise indicator light and cruise set indicator light
- (5) Transmission control module (TCM) (AT)
- (6) Inhibitor switch (AT)
- (7) Neutral position switch (MT)
- (8) Clutch switch (MT)

CRUISE CONTROL

CRUISE CONTROL SYSTEM

C: CONTROL AND OPERATION

Vehicle speed control	When the actual vehicle speed is higher than the set speed, the throttle valve of the electronic control throttle moves in the closing direction by the amount corresponding to the difference between the two speeds. When the actual vehicle speed is lower than the set speed, the throttle valve of the electronic control throttle moves in the opening direction by the amount corresponding to the difference between the two speeds.
Speed set function (SET function)	When the SET/COAST switch is pressed while the vehicle is running at a speed greater than 40 km/h (25 MPH) and the MAIN switch is ON, the cruise control is set at the current vehicle speed (this speed becomes the "memorized speed") and the vehicle maintains this speed thereafter.
Resume control function (RESUME function)	When the RESUME/ACCEL switch is turned ON after the cruise control is temporarily cancelled, the vehicle speed returns to the memorized speed, which was stored just before the cruise control was cancelled. This occurs only when the vehicle is running at a speed greater than 32 km/h (20 MPH). In the following cases, however, the memorized speed is cleared. (1) Ignition switch is turned OFF (2) MAIN switch is turned OFF (3) Abnormality in the system is detected
Deceleration control function (1) (COASTING function)	When the SET/COAST switch is pressed for a prolonged time while the vehicle is governed by the cruise control, the memorized vehicle speed of the cruise control is changed to the vehicle speed value reached at the moment the switch is released after slowing down. However, the cruise control is cancelled when the vehicle speed becomes lower than the lower limit of the speed setting range.
Deceleration control function (2) (TAP DOWN function)	When the SET/COAST switch is pressed for a short time while the vehicle is governed by the cruise control, the cruise control subtracts a certain amount from the memorized speed to obtain a new value. However, when the actual vehicle speed largely differs from the memorized speed, the actual speed becomes the new memorized speed of the cruise control.
Acceleration control function (1) (ACCELERATING function)	When the RESUME/ACCEL switch is pressed for a prolonged time while the vehicle is governed by the cruise control, the memorized speed of the cruise control is changed to the vehicle speed value reached at the moment the switch is released after accelerating. However, when the vehicle speed is higher than the upper limit of the speed setting range, the upper limit becomes the memorized speed of the cruise control.
Acceleration control function (2) (TAP UP function)	When the RESUME/ACCEL switch is pressed for a short time while the vehicle is governed by the cruise control, the cruise control adds a certain amount to the memorized speed to obtain a new value. However, when the actual vehicle speed largely differs from the memorized speed, the cruise control maintains the former memorized speed.
Cruise control cancel function	When any of the following conditions is met, the cruise control is cancelled. (1) Stop light switch ON (brake pedal depressed) (2) Brake switch OFF (brake pedal depressed) (3) Clutch switch ON (clutch pedal depressed) (4) Neutral switch ON (shift lever moved to neutral) (5) CANCEL switch ON (command switch pulled) (6) Ignition switch OFF (7) MAIN switch OFF (8) Transmission gear in 1st or reverse (9) Actual vehicle speed drops below 32 km/h (20 MPH) (10) Abnormality in the system is detected

CRUISE CONTROL

CRUISE CONTROL SYSTEM

E: COMMAND SWITCH (CRUISE CONTROL LEVER)

- When the vehicle is driven with the cruise control activated, the command switch controls its operation. It inputs MAIN signal, SET/COAST signal, RESUME/ ACCEL signal or CANCEL signal to the engine control module (ECM).
- When the cruise control MAIN switch is turned ON, the cruise indicator light in the combination meter illuminates. Also, when the cruise control is set, the cruise set indicator light in the combination meter illuminates.

- (1) Command switch
- (2) MAIN
- (3) CANCEL
- (4) SET/COAST

- (5) RESUME/ACCEL
- (6) Engine control module (ECM)
- (7) Ground

- The command switch is located on the right side of the steering wheel, so the driver can operate it without releasing hands from the steering wheel.
- The command switch is a self-returning lever type.

1. MAIN SWITCH

When the switch is pushed once the cruise control system turns ON and becomes ready to set the cruise control. When the switch is pushed again the cruise control turns OFF.

2. CANCEL, RESUME/ACCEL AND SET/COAST SWITCH

Each switch contact is held closed as long as the lever is kept pressed in the relevant direction (except the CANCEL switch which should be pulled), and resulting current is applied as a signal to the engine control module (ECM).

F: CANCEL SIGNAL

A cancel signal deactivates the cruise control function. Operating any of the following switches results in generation of a cancel signal. On receiving a signal, the engine control module (ECM) cancels the cruise control function.

- Stop light switch
- Brake switch
- Clutch switch (MT)
- Inhibitor switch (AT)
- Neutral position switch (MT)
- MAIN switch (OFF operation)
- Command switch (CANCEL position)
- Ignition switch (OFF operation)

G: VEHICLE SPEED SIGNAL

Vehicle speed signals are sent from the ABS control module or vehicle dynamic control (VDC) control module to the engine control module (ECM), which uses the signals in controlling the cruise control function.

H: ENGINE CONTROL MODULE (ECM)

- Based on signals from the related switches and sensors, the engine control module (ECM) controls all the following control functions:

Constant speed control; speed setting control; deceleration control; acceleration control; resume control; manual cancel control; low speed limit control; electronic control throttle control

- The engine control module (ECM) (A) is located at the legroom of the front passenger's seat.

CC-00274

CRUISE CONTROL

CRUISE CONTROL SYSTEM

I: FAIL-SAFE FUNCTION

The cruise control system has a fail-safe function that cancels the cruise control operation when any of the following conditions occurs.

1. CONFLICT BETWEEN CRUISE CONTROL SWITCHES AND CANCELLATION SIGNAL GENERATING SWITCHES

- The cruise control system is deactivated if any of the cruise control switches (SET/COAST, RESUME/ACCEL, and CANCEL switches) is turned ON while any of the cancellation signal generating switches (brake, stop light, clutch, neutral position and inhibitor switches) is activated. The system is re-activated when the cruise control switch is turned OFF and then turn ON again after the cancellation signal generating switch has been returned to its released position.

- When the ignition switch is turned ON while any of the command switches is in the ON position, the cruise control system is deactivated. The system deactivating function is retained until the ignition switch is turned OFF.

2. ABNORMALITIES IN ELECTRIC CIRCUITS

The cruise control system is deactivated and the set speed is also canceled if any of the following abnormalities occurs in the system electric circuits. The system deactivation function is retained until the ignition switch is turned OFF.

- Abnormality of the command switch is detected.
- Abnormality of the stop light switch and brake switch is detected.
- Abnormality of the inhibitor switch is detected. (AT)
- Abnormality of the neutral position switch is detected. (MT)
- Abnormality of the ignition switch is detected.
- Change in vehicle speed signal is detected.
- Abnormality in any of the engine related sensors is detected.
- Abnormality of the brake switch input circuit in the engine control module (ECM) is detected.
- The MAIN switch and command switch were already ON when the ignition switch is turned ON.

3. CRUISE CONTROL CANCEL FUNCTION

When any of the following conditions is met, the cruise control is cancelled.

To set the cruise control again, the vehicle speed must be returned to within the speed setting range and necessary conditions must be met.

- Abnormal engine speed acceleration is detected.
- The vehicle speed has dropped below the lower control limit during cruise control driving.
- The vehicle has been running at speed higher than the set speed for an abnormally long time during cruise controlled driving.
- The set speed became impossible to be maintained for some reason (steep upgrade, hand brake operation, abnormal engine power drop, etc.).

GENERAL

LAN SYSTEM

1. General

A: LAN

- The LAN system*¹ enables data sharing among computers, that otherwise are left to function as independent systems, by connecting them via communications lines.
- Introduction of the LAN*¹ system has improved equipment and functions while reducing the weight of the vehicle by eliminating a considerable amount of harnesses.
- Data transmission/reception is via CAN *², which offers high-speed communication and also ensures a high level of reliability.
- Depending on control requirements, two transmission rates are used: high-speed CAN running at 500 Kbps, which is an ISO 11898 and manages power-related units; and low-speed CAN running at 125 Kbps, which is an ISO 11519-2 and manages body-related functions.
- Networks running at different transmission rates usually cannot share data between them, however, the body integrated unit with a gateway (hookup) function enables data sharing between different-rate networks.

NOTE:

*¹: LAN (Local Area Network). A system where multiple computers (units) are linked via serial communication for data sharing.

*²: CAN (Controller Area Network). A serial communications protocol in compliance with ISO 11898 and ISO 11519-2.

B: CAN

- CAN is a serial communications protocol in compliance with relevant ISO standards.
- With its high bit rates, CAN enables quick, large-volume data transmission/reception.
- Based on continuous change in bus level (logical signals: low "0" and high "1") stemming from voltage difference between CAN_High and CAN_Low, data and other frames are configured for message identification.
- If an error is detected, CAN's fault confinement feature prevents the error from impacting units.
- If an error is detected, an error frame (notification that an error has been detected) is sent to units, telling them not to perform control based on data including errors.
- Depending on the status of the error detected, transmission/reception of the relevant data will be aborted.

C: COMPARISON BETWEEN CAN AND CONVENTIONAL DATA COMMUNICATION

- With conventional data communication, each sensor relies on its dedicated wiring for message to be sent between units. As data volume grows, so does the volume of wiring.
- CAN uses only one twisted-pair cable to connect between units for shared communication.

1. CONVENTIONAL COMMUNICATION

LAN00045

- | | |
|--------------------------|------------------|
| (1) Sensor | (4) TCM |
| (2) ECM | (5) Transmission |
| (3) Communication wiring | |

NOTE:

Conventional data communication needs as many data transmission lines as sensors used. (parallel signals)

GENERAL

LAN SYSTEM

2. CAN COMMUNICATION

LAN00046

- | | |
|-------------------|-------------------|
| (1) Sensor | (4) CAN line (HI) |
| (2) ECM | (5) TCM |
| (3) CAN line (LO) | (6) Transmission |

NOTE:

- With CAN, one twisted-pair cable (2 wires) manages transmission of all data. (serial communication)
- The main wire runs between the terminal resistor on the ECM and that on the ABS/CM or vehicle dynamics control (VDC) CM & H/U. Other units are connected, in parallel, to the main wire via branch wires.

2. LAN Configuration

A: NETWORK ARCHITECTURE

LAN00131

- | | | |
|--|--|-------------------------------|
| (1) Body integrated unit | (6) Combination meter | (A) High-speed bus (500 Kbps) |
| (2) ECM | (7) A/C ECM
(vehicles with automatic A/C) | (B) Low-speed bus (125 Kbps) |
| (3) TCM | | (C) High-speed system units |
| (4) ABSCM or VDCCM & H/U | | (D) Body integrated unit |
| (5) Steering angle sensor
(vehicles with VDC) | | (E) Low-speed system units |

NOTE:

- Bit rate 500 Kbps: The bit rate of 500 Kbps means that 500,000 bits of data are transmitted per second.
- Bit rate 125 Kbps: The bit rate of 125 Kbps means that 125,000 bits of data are transmitted per second.

LAN CONFIGURATION

LAN SYSTEM

B: LAN CONNECTED UNITS

1. UNITS CONNECTED VIA HIGH-SPEED LAN

Vehicle type	Sedan				Wagon

LAN00048

- | | |
|---|--------------------------|
| (1) ECM | (6) Body integrated unit |
| (2) TCM (AT models) | (7) Twisted-pair cable |
| (3) VDCCM & H/U (vehicles with VDC) | (8) CAN_HI |
| (4) Steering angle sensor (vehicles with VDC) | (9) CAN_LO |
| (5) ABSCM & H/U (vehicles without VDC) | (10) Terminal resistor |

LAN CONFIGURATION

LAN SYSTEM

NOTE:

- Terminal resistors built into the ECM and VDCCM & H/U stabilize traffic on the bus, and enables signals distinction from the voltage difference between the two bus lines (CAN_High and CAN_Low). These bus lines are called the main lines. Other units are connected in parallel to the main lines. These wires are called branch lines.
- If one bus line of the main lines becomes open, this is detected as an error and communication becomes no longer possible.
- If one bus line of a pair of branch lines becomes open, communication with the unit connected to the branch line becomes no longer possible, however, communication with other units remain intact. (The error will be displayed.)

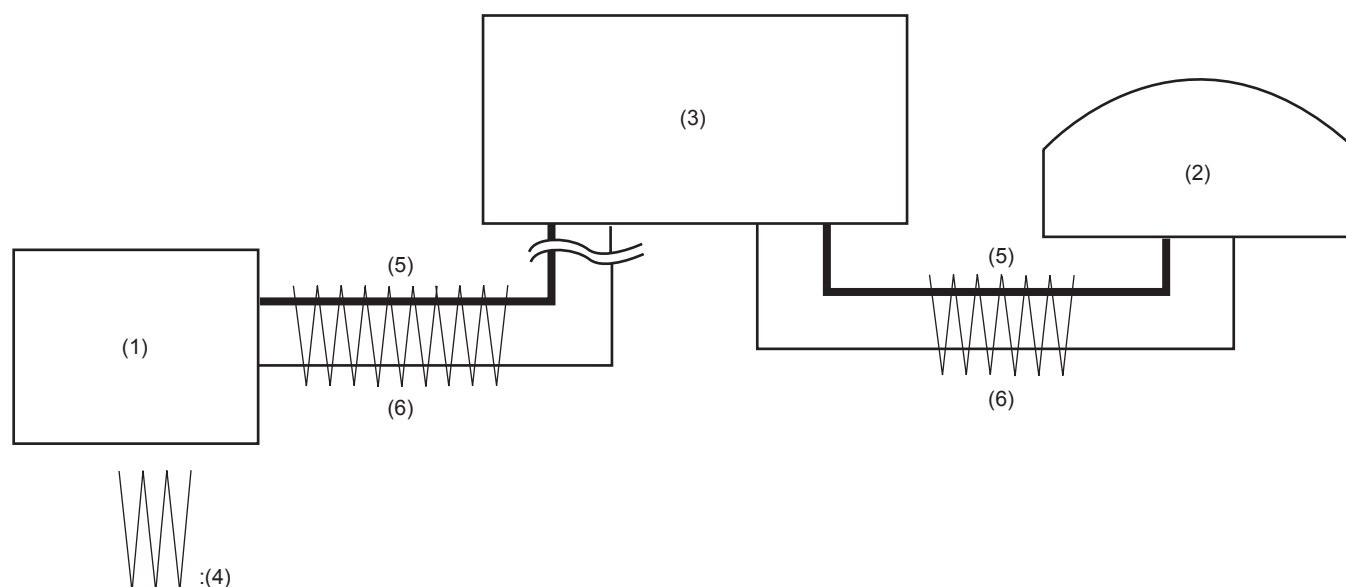

LAN CONFIGURATION

LAN SYSTEM

2. UNITS CONNECTED VIA LOW-SPEED LAN

Vehicle type	Sedan								Wagon

WHAT IS CAN?

LAN SYSTEM

3. What is CAN?

A: FEATURES

- Some of the basic specifications of CAN, intended to ensure smooth multiplex data communication, are described below.

1. MULTIMASTER

- When the bus (communication line) is free, any unit may start to transmit a message.

2. MESSAGE TRANSFER

- All messages on CAN bus are sent in fixed formats.

- When the bus (communication line) is free, any unit connected to the bus may start to transmit a message.

- If two or more units start to transmit messages at the same time, these messages are prioritized using the identifier.

- The identifier does not indicate the destination of the message, but it signifies message priority for bus access.

- If two or more units start to transmit messages at the same time, bitwise (smallest-unit) arbitration is performed over the identifiers carried by the messages. The unit that has won the arbitration as carrying a higher-priority message continues to send the message while the unit that has a lower priority stops sending the message, and starts sending the message again after waiting for a while.

3. SYSTEM FLEXIBILITY

- As units connected to the bus do not have unique information like an address, other units can be added to the bus without changing the software, hardware, or application of the units.

4. BIT RATE

- The bit rate can be set to suit the applications of the communication network.

- The bit rate of all units connected to the same network (bus) must be uniform. Connecting units of different bit rates to the same bus will cause communication disturbances.

5. ERROR SIGNALING AND COMMUNICATION RECOVERY

- Error signaling: Any unit connected to a bus can detect an error, and upon detecting an error, the unit notifies all other units of the error.

- Communication recovery: If a unit detects an error while sending a message, the unit will abort the message and keep retransmitting the message until it is successfully sent. (communication recovery)

6. FAULT CONFINEMENT

- In CAN, there are two types of errors: temporary alteration of data on the bus caused by external noise or other disturbances; and permanent alteration of data on the bus caused by faulty units, failed drivers, open wire, or other failures. Causal units will be cut off from the bus to prevent such disturbances/failures from affecting other units.

7. CONNECTION ENVIRONMENTS

- The CAN bus accommodates connections of a number of units to it.
- There are no limitations on the number of units that can be connected to the CAN bus, however, if the bus length needs to be longer or the bit rate needs to be higher, the number of units needs to be smaller. On the other hand, if the bus length is relatively short or a relatively slower bit rate can be accepted, a greater number of units can be connected.
- As signals are distinguished with the voltage difference between the two bus lines (CAN_High and CAN_Low), the main lines and branch lines must be properly connected.

FAULT DETECTION

LAN SYSTEM

4. Fault Detection

A: COMMUNICATION ERROR INDICATIONS

- If a fault occurs in the body integrated unit or LAN system (in any unit or the communication circuit), a communication error indication is given at the trip information display area on the combination meter.
- The indication differs by the type of fault, and related indicators such as the CHECK ENGINE light illuminate.
- If a communication error indication is given, one or more diagnostic trouble codes are stored in the body integrated unit. To read out diagnostic trouble codes, use a Subaru select monitor.
- If more than one diagnostic trouble code is stored, indication is given in the following order of priority: (1) High-speed CAN (2) Low-speed CAN (3) integrated unit (4) EGI (5) TCM (6) VDC

NOTE:

The indication returns to the normal trip display when the trip reset switch is pushed.

(1) Communication error indication area (trip meter)

CAUTION:

- Information registered in the body integrated unit must coincide with the vehicle's equipment and specifications for normal operation and diagnosis.
- If the body integrated unit is brand-new or put in factory mode, the key ring illumination blinks to indicate that equipment setting is not completed.

FAULT DETECTION

LAN SYSTEM

Types of communication error indications

Communication error indication	Description	Location of fault
Er --	High-speed CAN and low-speed CAN failed	Abnormality is found in both the high-speed and low-speed CAN communication systems.
Er HC	High-speed CAN failed	Abnormality is found in the high-speed CAN system.
Er LC	Low-speed CAN failed	Abnormality is found in the low-speed CAN system.
Er IU	Integrated unit failed	Abnormality is found in the integrated ECM or in its related parts.
Er EG	EGI communication data abnormal	Abnormality is found in the EGI ECM or in its communication system.
Er tC	TCM communication data abnormal	Abnormality is found in the TCM ECM or in its communication system.
Er Ab	ABS/VDC communication data abnormal	Abnormality is found in the ABSCM/VDCCM & H/U unit or in its communication system.

B: SUBARU SELECT MONITOR

1. READING DIAGNOSTIC TROUBLE CODES

- Diagnostic trouble codes can be read with a Subaru select monitor set in its body integrated unit mode.

2. READING CURRENT DATA

- Use a Subaru select monitor to read analog and digital data. (Confirm necessary items when customizing.)

3. MEMORY CLEAR MODE

- Use a Subaru select monitor to erase diagnostic trouble codes.

4. CUSTOMIZING (SETTING FUNCTIONS)

- Use a Subaru select monitor to perform detailed setting of body control related functions.
- When replacing immobilizer related components, registration of the immobilizer may be necessary.
(Refer to the immobilizer registering manual.)

CAUTION:

When customizing, do not change the factory mode resetting function to factory mode. If you do this, settings stored in the body integrated unit will be reset to initial values and the unit will not operate normally. In this case, perform registration of the body integrated unit from the very beginning.
